Confirmed by Clinical Evidence...

Amniotin Relieves Menopausal Symptoms

THE list of papers attesting to the clinical value of Amniotin in alleviating distressing menopausal symptoms is very substantial in number. As early as 1929 Sevringhaus and Evans¹ reported Amniotin to be "of marked value in the relief of the vasomotor phenomena of the menopause."

Indicative of the effectiveness of this endocrine therapy is the recent statement by Novak² that "Whereas formerly there was much difference of opinion among clinicians as to the efficacy of hormone treatment, opinion is now unanimous that it is of genuine value. In fact, organotherapy for menopausal symptoms is looked

upon as one of the more satisfactory applications of endocrine knowledge in the field of gynecological practice."

Complete relief is more easily obtained if treatment is started early and adequate dosage used. The milder forms of disturbance often can be controlled by the oral administration of Amniotin in capsules. Larger doses, administered intramuscularly, are suggested for resistant cases or in the surgical menopause.

Amniotin is a highly purified preparation of naturally occurring estrogens. It is available in Capsules containing the equivalent of 1000, 2000 and 4000 International units of estrone, in Pessaries of 1000 and 2000 I U., and in 1-cc ampuls containing 2000, 5000, 10,000 and 20,000 I U.

Harcourt, Brace and Co., 1940 Cloth, \$5 00
 This is the life story of Dr Hugh Hampton Young, the distinguished urologist and surgeon, of Johns Hopkins

The chapter, captioned "Developing a Specialty," traces the story of the rise of urologic craftsmanship to the dignified position it holds today in American surgery. It is about this chapter that there may be some controversial discussion, because Dr Young has included a rather full description of the technic of many of his surgical procedures, with, at times, a simplified terminology for the lay reader. Thereafter follows the story of the James Buchanan Brady Urological Institute, with a detailed account of the life and personality of Diamond Jim Brady, whose financial contributions made the building possible and for whom the institute was named.

Something more than a fifth of the book is devoted to the varied experiences of Dr Young in the World War of 1914 to 1918, from which he emerged as Colonel, D S M., having contributed much to the urologic and the venereal problems of the A E F. Many of the personal reminiscences and intimate contacts with military and medical matters make interesting reading.

The reader will be astonished at the extent and the variety of the extracurricular activities of this busy surgeon. Music, art, opera, adequate hospital facilities for the tubercular and insane patients—to all of these, Dr Young found time to give the benefits of his prestige and his wide social and personal connections. Toward the close of the book he tells of more intimate things—his extensive travels, his interest in hunting and fishing, and his family. After a life so full of diversified interests and activities, it is significant of the man when he says "But my real life—my greatest happiness and my most thrilling experiences—has been at the Brady Urological Institute."

J RAPHAEL

Office Urology. With a Section on Cystoscopy. By P S Pelouze, M D. Quarto of 766 pages, illustrated. Philadelphia, W B Saunders Company, 1940 Cloth, \$10

This is an excellent book on urology as practiced in an office and is descriptive of the usual office routines. It is easy and pleasant reading. It would be a worthwhile book if only for the helpful hints and explanations of the fundamentals and simple procedures that most of us take for granted and which we have learned through bitter experience rather than from the written word.

One can forgive the author for straying from the beaten path of strictly office procedures at times, such as the description of culture methods and of roentgen ray in diagnosis. The latter is glossed over in a few pages.

The physiology and diseases of various organs are discussed more comprehensively in many other volumes on the subject, but the introductory remarks discussing the instruments used in an office and the arrangement of furniture and of rooms are excellent.

The chapters on history-taking and examination of patients are exceptionally good. The

chapter on sexual problems is interesting and refreshing and should be studied by every practicing urologist.

FEDOR L SINGER

Methods of Treatment. By Logan Clendening, M D., and Edward H Hashinger, M D. Seventh edition. Octavo of 997 pages, illustrated. St Louis, C V Mosby Co., 1940 Cloth, \$10

The seventh edition of Clendening's deservedly popular book on treatment carries the name of Edward Hashinger as junior author, with twelve other collaborators in special fields. It may be said at once that it is an excellent book and will be found useful by physicians throughout the country. The style, especially where it bears the imprint of Clendening's personality, is often witty and pungent, but there are still a few old-fashioned terms employed. Medicaments are still "exhibited" and sprays are "grateful."

It is inevitable where there is so much collaboration that there should be some unevenness in the chapters and even some variation in the advice given. On page 154 the impression is distinctly given that morphine is the drug of choice in asthma, on page 630 this impression is fortunately corrected, and on page 633 the warning is finally given (although not as forcibly as the reviewer would wish) that the drug is positively dangerous in bronchial asthma. Nitroglycerin is not mentioned in the treatment of gallbladder colic, no mention at all is made of amidopyrine, even to warn against its indiscriminate use, novasurol is still listed among the mercuripruritics, while no mention is made of the mercuripruritics, while no mention is made of the mercuripruritics. These, however, are minor defects in a volume that otherwise maintains a high standard throughout. If it could be somewhat shortened and the cost reduced correspondingly, this work of Clendening's would probably be found in the great majority of medical offices.

MILTON PLOTZ

Diseases of the Urethra and Penis. By E D'Arcy McCrea, M D. Octavo of 306 pages, illustrated. Baltimore, Williams & Wilkins Company, 1940 Cloth, \$8 50

This book gives in detail the present-day knowledge of the diseases of the urethra and penis.

Every lesion of the urethra and penis, whether of inflammatory, neoplastic, or traumatic origin, is described and treatment is outlined.

It has a complete bibliography. The book is well written, thoroughly up to date.

PHILIP GOLDFADER

Loose-Leaf Specialties in Medical Practice. Chapter on Dermatology and Syphilis. By Svend Lomholt, M D., and James L Miller, M D. Octavo. Pages 935 to 1072. New York, Thomas Nelson & Sons, 1940

Because of war conditions in Europe, this chapter was delayed but is now ready for distribution. The supplement contains a comprehensive survey of the various dermatoses met in general practice. The section on dermatology is excellent. Among the more important conditions, one finds such subjects discussed as aller-

[Continued on page 527]

Travel in Medicine

RECENT FIGURES released by the Department of State and published in *The Travel Agent*, leading trade publication of the travel industry, provide an interesting and illuminating breakdown on users of passports during the year of 1940

Of the total 26,253 passports issued during the twelve months (hold your breath) the laboring class used 3,635 or approximately 14 per cent of the entire number granted Americans going abroad. Housewives came second with 3,194, students third with 2,270, and office workers fourth with 1,840. The "unemployed" (at least they claimed no occupation) ranked fifth with a total of 1,809 travelers.

Doctors were listed about a third of the way down, in twelfth place, with 459 passports issued to them, and nurses in eighteenth place numbered an even 400.

The "object of travel" pertaining to the 26,253 passports granted, is interesting too. More than a third, 10,380 to be exact, were traveling for pleasure entirely. 12,249 traveled strictly for personal or other business reasons. 3,439 journeyed to new posts of employment and 185 were traveling for their health (no indication made of how many were fugitives for their health).

Under "destination," another breakdown of the total passports taken out during 1940 showed 15,508 going to Latin American countries, 5,291 to the Far East, 1,945 to Bermuda, 1,528 to Western Europe (obviously not for pleasure), 728 to Canada and Newfoundland, 607 to the Near East, 570 to Australia and New Zealand, 396 to Africa, and (decidedly not for reasons of health) 48 voyaged to Eastern Europe.

In passing over these figures, it is interesting to note the effect World War II has had on travel abroad. In 1938 the total passports granted numbered 134,737. Doctors numbered 2,071 and nurses 1,872. Western Europe (with no war imminent) received the lion's share of this travel with 110,572—82 per cent as compared with the 1,528 or only 6 per cent in 1940. Latin America alone has profited, for some 5,000 travelers have been diverted to the south lands which now enjoy first place

in the destination of Americans traveling outside our borders.

While the figures of both war and pre-war years tend to subordinate the classification of "doctors" as merely a fair travel-conscious class, a true analysis reveals that as a group doctors are more generally active travelers than any other distinct group of individuals. Using the figures for last year, among all individuals of adult age approximately only one in every 3,000 were travelers abroad, while one doctor out of every 380 traveled outside of the United States.

Before the war, on a purely commercial basis, the doctor was recognized as America's No. 1 Traveler. Even the new, general World disturbances haven't changed that apparently. Not only was he considered the topnotch user of travel services himself, he was also regarded highly as a travel promoter as well. Not at all strange, for almost since the dawn of medicine, the doctor has been prescribing travel as a stimulant for restoring health in body and spirit.

The small number traveling for health, quoted in the "travel census" just outlined, is not too insignificant. Viewed from the angle of limitations and aversions to ocean travel due to imagined or real war hazards, it is surprisingly good. There is no record to show that the entire 185 were voyaging because of a direct recommendation of a physician, but it is logical to assume that no person in ill health would venture on a journey of any kind without first seeking the advice of a doctor.

Whether "Travel in Medicine" will become even more important in the years following the resurrection of World Peace, it is difficult to predict. Even now, though limited largely to the Western Hemisphere, "travel" should be playing a very important part in medicine. Besides the element of personal interest, medical practitioners should be concerned in the professional, educational, and therapeutic aspects as well.

Where and how an individual travels is just as important from a standpoint of health as it is from one of safety.

the success of **THESODATE** (Brewer)

(Original enteric coated tablet of Theobromine Sodium Acetate)

is due to three factors

1. It is Clinically Proven
2. It is effectively Enteric Coated
3. It is decidedly Less Expensive

Indicated in treatment of coronary artery disease and edema.

Dosage: One 7 1/2 gr. tablet 4 times a day before meals and upon retiring.

Available on prescription in 7 1/2 gr. tablets with or without Phenobarbital (1/2 gr.) or 3 3/4 gr. tablets with or without Phenobarbital (1/4 gr.) 100 per bottle.

Institutions of Specialized Treatments

Occupational Therapy

FEW METHODS of treatment in hospitals and sanitariums have received as great an impetus during recent years as has "occupational therapy."

It has even been recognized as a vital need in our program for preparedness. At the outset of all the plans

to mobilize the nation's resources and skill, the American Red Cross was requested by the Surgeon General of the Army to enroll every available and qualified occupational therapist for service if needed. This is not surprising for it was the Army during the last World War which found other uses for this form of therapy besides treating the mentally ill. At the beginning of this year the

gens in various occupations, exfoliative dermatoses, pyococci and filterable viruses affecting the skin, neurogenic lesions, avitaminoses, and tuberculosis and syphilis of the skin

The section on syphilology discusses the various forms of treatment. The recent five-day treatment by intravenous drip for twelve hours each day is cited. Also the reactions and prevention of reactions in all forms of treatment is mentioned. There are 75 good illustrations in this chapter. The set is now complete in two volumes and is a condensed encyclopedia of the specialties in medical practice for the general practitioner

MAURICE J DATTELBAUM

Principles of Hematology with 104 Illustrative Cases and 167 Illustrations, Including 173 Original Photomicrographs and 100 Original Charts and Drawings By Russell L Haden, M D. Second edition. Octavo of 362 pages, illustrated. Philadelphia, Lea & Febiger, 1940. Cloth, \$4.50

The second edition of this masterpiece differs from the first in but few significant changes, illustrative cases have increased from 100 to 104, illustrations from 155 to 167, original photomicrographs from 168 to 173, and original charts from 95 to 100. Haden takes a subject which is ordinarily regarded as difficult by the student and makes it simple. This he accomplishes by his original diagrammatic portrayals of the important blood dyscrasias and by the use of illustrative cases. It is easy to recommend this book because it is a pleasure to read. The biophysics of the red cell is illuminating. The approach to the entire subject of blood formation and destruction is incomparable. Authors in other subjects would do well to use this treatise as a text in method of presentation. This book has what most others have not

MAURICE MORRISON

Vitamin Therapy in General Practice By Edgar S Gordon, M D, and Elmer L Sevringhaus, M D. Octavo of 258 pages, illustrated. Chicago, The Year Book Publishers, 1940. Cloth, \$2.75

A great many books, reviews, and separate articles have appeared within the last few months dealing with theoretic and clinical applications of vitamins. Only too often such papers help to confuse one and have altogether too many varying opinions. To those who are still "at sea," as well as to those who would like a handy reference book which adheres as closely as is possible to important and proved facts, this small volume by Gordon & Sevringhaus will come as a great boon. For the latest and best opinion on clinical and laboratory applications of vitamin therapy, this book, in the reviewer's opinion, has no peer. It can be most warmly recommended.

ANDREW M BABET

A Manual of Embryology The Development of the Human Body By J Ernest Frazer, F.R.C.S. Second edition. Octavo of 523 pages, illustrated. Baltimore, Williams & Wilkins Co., 1940. Cloth, \$9.00

Without a rather thorough preliminary groundwork in embryology this book would be most

difficult for the average student. However, when we assume the presence of such a basis, the book becomes a valuable and quite necessary addition to the library of a student of gross anatomy conscious of developmental processes. In general the text is thought-provoking. Many of the illustrations depart from the conventional type and thereby suggest new approaches to a more thorough understanding of the subject. A serious defect is the lack of a bibliography. An outstanding chapter is that on the development of the face

GEORGE H PAFF

The Bacteriology of Public Health By George M Cameron, Ph D. Octavo of 451 pages, illustrated. St Louis, C V Mosby Co., 1940. Cloth, \$3.50

There is a good deal of useful information in this book, but all the subject matter is presented in too brief a fashion. As a "review text" it could be of help to students who have had a well-rounded course in bacteriology. It could be recommended as a text for beginners in bacteriology only in the event that a very complete and comprehensive lecture course accompanied it.

MORRIS L RAKIETEN

Why Men Behave Like Apes and Vice Versa, or Body and Behavior By Earnest A Hooton. Octavo of 234 pages, illustrated. Princeton, Princeton University Press, 1940. Cloth, \$3.00

Professor Hooton's latest book is an odd mixture of modern science and primitive sociology. It is a new statement of the author's sincere but extreme point of view on mental inheritance in which the Harvard eugenicist insists on the inseparability of mind and body and denies the environmentalist approach of social conditioning. The book includes considerable data on anthropoid behavior and human evolution, from which the author concludes that "behavior is indissolubly associated with organic structure." He pleads for the adoption of a strong positive eugenic program as the only means of saving the human race. Perhaps of most interest to the scientist is the last section which deals with anthropometrics, particularly with the somatotype method which classifies individuals according to bodily build.

Dr Hooton's material is interesting, but his radical conclusions are open to considerable argument. The book is written in the author's usual witty and entertaining style and is well worth reading by anyone interested in anthropology and eugenics.

MILTON PLOTZ

Microbiology and Pathology By Charles F Carter, M D. Second edition. Octavo of 755 pages, illustrated. St Louis, C V Mosby Co., 1939. Cloth, \$3.25

There have been numerous changes in this edition, all adding considerably to the efficiency of an already popular text for nurses. Greenish tinted paper, spacing of print, and general arrangement signify the thoughtful presentation of material well correlated for two such subjects. Laboratory exercises, review questions, and references given at the end of each chapter should prove valuable.

IRVING M DERBY

A Guide to Select Schools

SCHOOLS OF REFINEMENT WITH HIGH RATING IN EDUCATIONAL AND CULTURAL ADVANTAGES

Preschool Training of the Deaf

In the February issue of *The Volta Review* there appears a translation from a Russian article "Life of the Deaf"

It treats with the training of deaf-mutes of preschool age and emphasizes greatly, the importance of home direction and help for the young one. The author, Natalie Rau, states that "mothers have to be convinced that only well-trained work with the child can create or restore speech, but that hearing cannot be fully regained because

no physical, no medical action can restore a paralyzed or shattered hearing center"

It is explained to the mother that a hearing aid might help develop a beginning of hearing and train attention to hearing, but there are many things the mother can do and should do to prepare the child for the kindergarten class of the special school of training

The mother is instructed in simple fundamentals of teaching lip reading, imitation of speech, exercises of developing attention to the voice, sounds and words, and for arousing an interest in hearing

Unquestionably, the family physician is the first person consulted in these unfortunate cases. Perhaps for no other reason, he shoulders the greatest responsibility of directing the child's life right from the beginning, and upon his interest rests the ultimate possibility of a deaf mute being able to live a normal life with those who speak and hear naturally

NEW YORK STATE JOURNAL OF MEDICINE

Copyright 1941 by the Medical Society of the State of New York

VOLUME 41

MARCH 15, 1941

NUMBER 6

Editorial

New Zealand Acts

Without stressing the other many objections of the medical profession to free medical care (*state or tax-paid medical service*), let us again state the fundamental one that any tax-paid minimum wage or fee scale tends to promote incompetency. It does so by discouraging participation of the better qualified by the low rate of return on original investment in education and on time expended in practice. It provides enough return, however, to maintain in practice on a quantity production basis the less well qualified who have no ethical scruples against turning out work on that basis with little regard for quality.

It is understood, of course, that the *New York Times* has no choice but to print "all the news that's fit to print." Admiring, as we do, its high standards and integrity, we are the better able to appreciate the shudder, the gasping respiration, the cold sweat and enfeebled pulse, the pallor, the clammy shivering, and the wave of editorial nausea which must have swept the organization from the wire desk to the press men, from the science writers to the copy boys, when, on February 21, 1941, a dispatch by wireless told of the announcement by the Health Ministry of New Zealand that over the protests of physicians the "national free medical care" plan will start March 1. "When doctors send the (registration) cards to the health officials they will receive \$3 50 for each patient and travel allowances for journeys of

more than three miles in cities and twenty miles in the country. Doctors must provide suitable surgery accommodations and *visit every patient whose condition makes it impossible for him to come to the doctor*.* Until other arrangements are made they must supply drugs, for which they may charge patients. Dr. James Jameson, leader of the doctors, said there were not enough doctors to operate the plan here. It is believed the government expects the plan will be adopted by country doctors, leading to a gradual extension to all areas. It is estimated that the payments would give *even unsuccessful doctors the equivalent of \$700 yearly*."*

The public has been appealed to by the Health Ministry "not to make unreasonable demands on doctors and to consult them as far as possible in their offices." With which appeal the Health Ministry will retire, washing its hands according to precedent, to the business of making rules and regulations, prescribing forms, reports, accounting systems, penalties, setting up a business administration, receiving bids on offices, administration buildings, supplies of paper, ink, accounting machines, filing cabinets, docket folders, paper clips, and typewriter ribbons, looking over printing bids, applications for clerical positions, inspector's jobs, compiling manuals of procedure, acceptable drugs, working out mileage rates, setting up zones, in

* *Italics ours—Editor*

fact doing all those necessary and indispensable little things which must be done to make tax-paid, free medical care the efficient and up-to-date political spending machine it has proved elsewhere to be. The Health Ministry hopes that its appeal to the public will be heeded. It always does, but, really, that is all that the Health Ministry can do, isn't it? "Come again, Mrs. Citizen, when we are not so busy, it's up to the doctors to make the plan work, you know, they are paid to do that, aren't they? Three dollars and fifty cents and allowances, why, *even unsuccessful doctors can earn the equivalent of \$700 yearly under the*

plan, and that should be ample to keep them unsuccessful for many, many years. What if you *don't* like them? Just pay your tax and don't call them. That's all today, can't you see we're busy? Call again."

Now we do not see always eye-to-eye with the *Times* as to the best means of improving medical care for the American people. But it is our hope that, recovered from its initial shock, the *Times* will agree with us that however we shall eventually solve our domestic problems in medical care it must not be by the tax-and-be-damned method of free medicine adopted by New Zealand.

Who Wants It and Why?

We are reliably informed that, at a recent conference of legislative committees of the Medical Society of the State of New York in Albany, the chairman of an important committee of the legislature remarked that he, personally, had never received from any *individual constituent* a letter or other communication asking for *compulsory* "health" insurance at any time during the last eight years.

If this is so in one instance, it may be equally true in many. It raises an interesting point. If no individuals ask for it, demand it, who does want it and why? Bills to *compel* it by law are constantly being introduced into Congress and the various state legislatures. Exhaustive inquiry reveals that physicians do not favor it, have not asked for it, medicine, in fact, claims that it does not and cannot exist,¹ that even if the proposed bills were enacted into law *sickness insurance* would result, not *health insurance*.

"The Law," said the late Mr. Gilbert, "is the true embodiment of everything that's excellent. It has no kind of fault or flaw." And, consequently, were the law to enact *compulsory* "health" insurance (as recently in New Zealand), it would be *compulsory* health insurance.

Who are we to raise questions of fact in this pleasant era of armed transcendentalism? But we *can* ask who wants the cursed thing whatever it is, and why? Apparently, except in certain cases, individuals do not, medicine does not, but, according to the *Times* of January 19, 1941, the American Association for Social Security and the New York Permanent Conference on Social Security do. Senator Capper (Kansas), Dr. Bertram Bernheim, Mr. Robert Watt, Senator Daniel Gutman, and Assemblyman Robert F. Wagner, Jr., the Consumers' League of New York, the National Federation of Settlements, and the United Neighborhood Houses of New York do among others, including, it is said, the A F of L and the C I O.

Why do they want it? Why do all these organizations cry for it in the wilderness? Why did Bismarck want it for the German people and get it? Why did Lloyd George want it for the English people and get it? Has *compulsion* a fatal lure for all men at some time? Perhaps. But

"Give you a reason on compulsion!
If reasons were as plentiful as black-
berries, I would give no man a reason
upon compulsion."²

"War Medicine"

A new medical journal has appeared. It is one of the most timely periodicals ever to be published. While we have, from time to time, suggested that the profession be informed and be given instruction in all phases of medical preparedness, it remained for our parent organization, the American Medical Association, to initiate *War Medicine*. The NEW YORK STATE JOURNAL OF MEDICINE welcomes it and extends to it sincere wishes for its success in its appointed task.

It came to us aborning with an excellent "table of contents." From the gossip gleaned at the christening, the opinion is unanimous that this child has a brilliant future. It represents the will and drive of our profession to give our all to the preservation of our American culture, and those who would destroy it are warned in the words of the prophet Isaiah¹: "Therefore shall evil come upon thee, thou shalt not know from whence it

riseth, and mischief shall fall upon thee, thou shalt not be able to put it off, and desolation shall come upon thee suddenly, which thou shalt not know."

As an uncle, forty-odd volumes old, might we suggest to our newborn nephew, *War Medicine*, or more appropriately to its parent, the A M A, that it train in the art of caring for the disasters that might befall the civilian population during this catastrophe that has been visited upon our world? Might it not also inform us how to instruct our charges in the art of self-preservation during bestial attacks from the aerial monsters we have created? It is well that military medicine be stressed, but those of us who, because of age or military infirmity, remain to care for the non-combatants, must also be instructed. So may we suggest for the development of its career that there be included in its scope "The Role of the Civilian Physician During War"?

Our hearty congratulations on the assured success of *War Medicine*!

Office Facilities

The articles, published elsewhere in this issue,¹ of Drs. James H. Sterner and Howard L. Prince stress, respectively, a program for detecting toxic responses to organic chemical substances and the importance of office treatment in traumatic surgery. It seems to us that as the hospital facilities of the Nation have increased, office treatment of injured men has been increasingly disregarded. While this may have been good practice in ordinary times, it might conceivably create a serious bottleneck were hostilities suddenly to break out.

It is the logical aim of defense preparations to foresee, and to prevent wherever possible, weaknesses in structure and faults in procedure. Our hospitals are normally operating in these times under

nearly peak loads. And it is to be anticipated that the speed-up in manufacturing processes will somewhat increase the normal accident rates in industry, airplane travel, and transportation operation of all kinds. This will undoubtedly increase the hospital case-load under the normal expectancy merely of defense preparations.

What if this country engages actively in war? Inevitably, the normal routing of industrial and other injuries will be dislocated. Inevitably, more traumatic surgery will have to be done in physicians' offices, inevitably, more follow-up and rehabilitation work will have to be absorbed in private offices to buffer the demands on the hospital facilities.

What facilities exist in these offices? What is the condition there of existing

¹ Isaiah, Chap. 47. II. The Holy Bible. New York Bible Society.

¹ See pages 594-603.

equipment? Immediate treatment is always an advantage in potentially infected wounds. Intelligent use of anesthesia is necessary if this is to be accomplished properly. How many private offices are equipped and staffed to make this possible? Information on this matter would seem to be of the greatest moment to a preparedness program carried on with thoroughness. To the best of our knowledge these resources have not yet been surveyed. It is hoped they will be soon.

The problem of the prevention of absorption and of the detection of toxic

organic compounds is most complex and difficult. Dermatitis has been numerically the most important disability resulting. Methods of detection are discussed in Dr Sterner's paper, but these are mostly laboratory procedures. However, a plan of attack is outlined on the problem of toxic effects where the specific action of the chemical is not known. This should serve a useful purpose for the practitioner who is confronted in the course of his experience with industrial employees whose principal symptom is a dermatosis of unknown origin.

A New Sulfonamide

The sulfonamide derivatives have proved to be of such success in the management of the acute infections caused by the streptococci, staphylococci, pneumococci, and gonococci that it was but natural that a search be made to discover another radical that might effectively destroy the tubercle bacillus *in vivo*. Feldman, Hinshaw, and Moses,¹ from the Mayo Clinic, report their experiments with the sodium salt of p,p'-diamino-diphenyl-sulfone-n, n'-dextrose sulphonate, which is called "promin."

Fifty adult male guinea pigs were placed on identical diets and were cared for equally in all other respects. For 30 of them promin was added to the daily feed. After the determined concentration of the drug in the blood stream had been reached, the promin was withdrawn for several days and then readministered two days prior to inoculation with tubercle bacilli. All of the control animals died within a period of eighty-two days,

whereas 13 of the guinea pigs who had received promin lived 164 days. Postmortem examinations were still more convincing of the efficacy of this sulfonamide product. The degree of infection, as evidenced by splenic involvement was minimal in 62 per cent of the treated animals, and in only 3.4 per cent was the tuberculous infection extreme. In other words, the severity of the disease was strikingly less in the animals who had been given promin.

Feldman, Hinshaw, and Moses feel that this drug is capable of inhibiting to a considerable degree the course of tuberculosis in guinea pigs which, upon inoculation, develop extensive lesions. Of course, the work is in its experimental stage, and the study is in the nature of a preliminary report. The hope, however, that this study affords that tuberculosis, like so many hitherto insurmountable obstacles in the progress of medicine, may soon be deprived of its power to create havoc warrants the keen interest of all investigators in the action of this new sulfone compound.

Attention All Members

A JOINT announcement by representatives of the New York State Department of Social Welfare and the Council of the Medical Society of the State of New York will be found on page 619 of this issue. It sets forth the coming together of minds of the two organizations on ways to improve provision of medical care of the indigent and near indigent in New York State. The editors hope that all members will study thoroughly the medical plan and discussion of the principles involved and keep the document close at hand for future reference.

If You Are Reading a Paper at the 1941 Annual Meeting . . .

the NEW YORK STATE JOURNAL OF MEDICINE will appreciate your following the suggestions listed below in the preparation of your manuscripts. These suggestions have been devised in order to save correspondence, avoid return of papers for changes, minimize the work of preparation for the printer, and save the high costs of corrections made on galley proof.

Size of Articles.—It is earnestly desired that scientific articles shall not exceed ten JOURNAL pages at the outside. Even that number of pages tends to lower reader interest. An average of five or six seems to be the most desirable from this point of view. Calculation can readily be made by multiplying the number of double spaced typewritten manuscript pages by the fraction two-fifths.

Manuscripts.—Papers must be typewritten on one side only of white sheets consecutively numbered, and be double spaced with one-inch margins. They should be prepared with great care so as to be typographically correct. All headings, titles, subtitles, and subheadings should be typed flush with the left-hand margin.

Titles.—The title should be *brief* and typed in capital letters. The subtitle can be longer and should be typed in cap and lower case letters. Under the title, or subtitle, if there is one, should appear the name of the author and city in which he lives.

Subheadings.—Subheadings should be inserted by the author at appropriate intervals.

References.—It is the unfailing practice of the NEW YORK STATE JOURNAL OF MEDICINE to use specific "references" rather than "bibliography." There should appear in the text reference numbers, typed above and to the right of the word to which there is a reference. A list, consecutively numbered, should include the following items:

- a. **Books.**—author's surname followed by initials, title of book, edition, location and name of publisher, year of publication, volume, and page number. Thus, Osler, W. Modern Medicine, ed. 3,

Philadelphia, Lea & Febiger, 1927, vol. 5, p. 57.

- b. **Periodicals.**—author's surname followed by initials, name of periodical, volume, page, month (day if necessary), year of publication. Thus, Leahy, Leon J. New York State J. Med. 40: 347 (Mar. 1) 1940.

NOTE. The JOURNAL does not include titles of articles.

Case Reports.—Instead of abstracts of hospital histories, authors should write these reports in a narrative style with properly completed sentences. All unimportant details should be deleted with such general negative statements as fit the case.

Tables.—While tables are very useful on lantern slides in the reading of papers, they fail of this purpose to a large extent in the printed page. For that reason it is urged that they be incorporated in the text.

Illustrations.—These should be kept to the minimum necessary to make clear the points to be registered by the author. In some instances they are imperative to proper understanding, in others they are merely picturesque.

Where illustrations are to be used they should accompany manuscripts and each should always be referred to in the text, preferably by number. Drawings or graphs should not be larger than 12 × 16 inches, and must be made with jet black India ink on white paper or tracing cloth. *Do not use typewriter for lettering.* The smallest lettering on 8 × 10 inch copy should be no less than 1/4 inch high. Cross-section paper (white with black lines) may be used, but should not have more than 4 lines per inch. If finer ruled paper is used, the major division lines should be drawn in with black ink, omitting the finer divisions. In the case of finely ruled paper, only blue-lined paper can be accepted. Lettering and all markings must be large enough to be readable after reduction. Mail rolled or flat. Photographs should have clear black and white contrasts and be on glossy white paper.

Whenever possible "crop" photographs, i.e., mark portion that can be excluded when reproduced. Crop marks should be on *margin* of photographs—not on the photographs.

It is important to mark the top of the illustration on the back, also its number as referred to in the text, thus, Fig. 1, 2, and the name and address of the author.

Legends. should be typewritten on one sheet of paper and attached to the illustrations.

equipment? Immediate treatment is always an advantage in potentially infected wounds. Intelligent use of anesthesia is necessary if this is to be accomplished properly. How many private offices are equipped and staffed to make this possible? Information on this matter would seem to be of the greatest moment to a preparedness program carried on with thoroughness. To the best of our knowledge these resources have not yet been surveyed. It is hoped they will be soon.

The problem of the prevention of absorption and of the detection of toxic

organic compounds is most complex and difficult. Dermatitis has been numerically the most important disability resulting. Methods of detection are discussed in Dr Sterner's paper, but these are mostly laboratory procedures. However, a plan of attack is outlined on the problem of toxic effects where the specific action of the chemical is not known. VIRUS DISEASES IN CHILDHOOD

F HOWELL WRIGHT, M D, Chicago

THE principal attribute that distinguishes viruses from other infectious agents is their small size. However, they possess other common properties that assume an equal importance in the study of virus infections. Chief among these are their intimate dependence upon living cells and their ability to incite more or less characteristic changes in the tissues of the host they invade.

The actual magnitude of viruses can be estimated by filtration through collodion membranes with pores of uniform and known size.¹ Table 1 shows the results obtained for some of the agents that enter into this discussion. The common bacterial cocci are roughly five times as large as vaccinia virus, since their diameters range from 500 to 1,200 $m\mu$. The elementary bodies of vaccinia virus can be seen in purified preparations with dark-field illumination, but, in general, viruses are below our present range of visibility. The smaller members of this group, poliomyelitis, for instance, possess diameters that are little greater than those of protein molecules, such as hemoglobin (4 $m\mu$) and egg albumin (5 $m\mu$).

Cultivation of these agents in lifeless artificial mediums has not been accomplished. Their processes of growth and reproduction are completely dependent upon the presence of living cells. Furthermore, each virus has its own peculiar requirements that limit the type of cell and animal species in which it will thrive.

Histologic study of virus-infected tissue usually reveals hyperplastic or necrotic changes in the susceptible cells, accompanied by a mononuclear inflammatory reaction. In some diseases these changes are highly specific, especially if they are associated with the formation of inclusion bodies, but often they afford little diagnostic aid.

Nearly all human virus infections may occur in children, but many of them have no practical importance for the pediatrician. Consequently, the scope of this discussion has been narrowed arbitrarily in order to focus upon those diseases enumerated in Table 2. They must be considered individually and briefly in a rather disconnected fashion.

Control of smallpox by prophylactic vaccination is an outstanding achievement in the virus field. The record for New York State during recent years could scarcely be improved, but smallpox still flourishes in some parts of the United States. During 1938 nearly 15,000 cases were reported,² and for 1939 the figure exceeded 9,000.³ It is true that these infections were mild, but they constitute a potential danger which might be eliminated by universal vaccination. A modification of the usual calf lymph vaccine has been prepared by growing vaccinia virus in artificial mediums containing chick-embryo tissue.⁴ This vaccine is sterile, may be used intradermally, and produces milder reactions. However, there is some doubt about the adequacy and duration of the immunity it produces,⁵ and its originators advise revaccination with a potent calf lymph after an interval of six months or a year.

The common exanthems and mumps are poor subjects for experimental work because they fail to produce regularly identifiable disease in laboratory animals. In the absence of methods of active immunization, the spread of these illnesses must be controlled through the production of temporary passive immunity with convalescent serum or placental globulin.⁶

The virus of herpes simplex has unusual properties which have stimulated many ideas concerning its role as a human pathogen. One current theory holds⁷ that during childhood most individuals become carriers of herpes virus, that the virus hibernates permanently somewhere in the body, and that under certain nonspecific stimuli, such as fever therapy,⁸ mechanical irritation, or the presence of unrelated disease (pneumonia, meningitis), the virus becomes reactivated and produces vesicles. Aphthous stomatitis is cited as a form of primary herpes invasion because it occurs in young (presumably non-resistant) children, because virus has been recovered from typical lesions,⁹ and because the appearance of specific neutralizing antibodies has been observed in the blood of a few convalescents.⁷ These antibodies are ordinarily absent from the blood of young children, but can be found in 90 per cent of normal adults. The explanation given for this widespread immune response is that a constant antigenic

and effective method of controlling human infections has not been devised, although some of the proposed technics have been founded upon sound experimental principles

No group of diseases is more confusing to the pediatrician than the variegated forms of encephalitis which he encounters. Clinical classifications are involved and confused because they cannot be based upon definite etiologic knowledge. A few types of primary encephalitis which can be designated as specific virus infections will be discussed presently, but first the classic form of epidemic encephalitis must be mentioned

Encephalitis lethargica, as described by von Economo in 1917, was an epidemic disease that appeared during the winter months. It presented an acute stage in which somnolence and disturbed vision were characteristic. After a variable interval, a slowly progressive chronic stage followed which was featured by bizarre neurologic and behavior disturbances, among them parkinsonism and oculogyric crises. In recent years, epidemics of this disease have been supplanted by an endemic form, in which the acute stage is frequently absent and symptoms of the chronic stage appear unheralded. Undoubtedly this is the most common type of encephalitis seen today

Ever since its original description, encephalitis lethargica has been considered an infectious disease—probably a virus disease. Indeed, several workers believe that a neurotropic strain of the virus of herpes simplex is responsible. This view has not been generally accepted because much of the experimental evidence accrued in its support is difficult to interpret. Most authorities state that the etiology of this, the classic form of encephalitis, is still unsolved

The type of encephalitis which appeared in St. Louis in 1933 was quickly recognized as a new disease. It occurred as a summer epidemic with a high attack rate. The onset was usually abrupt, with fever, stupor, and meningeal irritation. Muscular rigidity, tremors, and transient paralyses were commonly observed. The spinal fluid contained 50 to 250 lymphocytes. In children the mortality was less than 5 per cent and neurologic residua were mild and infrequent. No chronic or late manifestations have been described¹⁸

The search for an infectious agent was soon rewarded by isolation of a filtrable virus from the brain tissue of fatal cases¹⁷. This agent was highly pathogenic for mice, less so for monkeys. It was not recovered from the

spinal fluid. In convalescent patients humoral antibodies were found which specifically neutralized virus, affording a method of confirming the clinical diagnosis¹⁸. These antibodies were also found in approximately one-third of the healthy contacts examined

During the past three summers smaller epidemics of St. Louis encephalitis have probably occurred in the central and western states¹⁹. In the East only sporadic cases have been recognized. The manner in which this virus is disseminated is not known, and no method of specific prophylaxis or treatment has been developed

As the name implies, equine encephalomyelitis is primarily a disease of horses. The epidemics that appear annually during July, August, and September are caused by two closely related strains of virus. These confine their activities to separate geographic areas. The eastern strain is found only in cases that occur on this side of the Appalachian Mountains, while the western strain prevails throughout the rest of the country. Transmission of virus from horse to horse or from horse to man is probably accomplished by mosquitoes.²⁰

Except for one or two laboratory accidents, human infection with the eastern strain of this virus has been limited to a single epidemic which occurred in the vicinity of Boston in the summer of 1938. Approximately 40 persons were attacked by a fulminating form of encephalitis in which the mortality was 65 per cent, and deaths often occurred within forty-eight hours of the onset. Children were predominantly affected, and of those who survived several were left with severe central nervous system damage²¹

The etiology of this epidemic was established by the isolation of eastern equine encephalomyelitis virus from brain tissue of fatal cases and by demonstrating specific virus-neutralizing antibodies in the blood of those who survived²²

Fragmentary evidence suggests that human infection with the western strain of virus may be milder and more widespread. Specific neutralizing antibodies have been found in the blood of convalescent patients in Minnesota and California²³

In horses an active immunity can be produced with a vaccine prepared by formalinizing virus that has been grown in fertile hen's eggs²⁴. Preliminary field trials have been encouraging,²⁵ but the effectiveness of this vaccine must be judged over a period of years since the annual incidence of this disease is

TABLE 1—SIZE OF SOME COMMON VIRUSES*

	mμ
Vaccinia	125-175
Rabies	100-150
Herpes simplex	100-150
Influenza	80-120
Lymphocytic choriomeningitis	33-50
Equine encephalomyelitis	20-30
St. Louis encephalitis	20-30
Polio myelitis	8-17

* Values chiefly from *Viruses and Virus Diseases*, Lane Medical Lecture of 1939 by Dr. T. M. Rivers

stimulus is supplied by virus lurking in some inapparent form since the primary herpetic infection in childhood. The tissues in which virus hides have not been discovered experimentally, otherwise the evidence for such a carrier state would be fairly complete.

Inclusion blennorrhoea is uncommon, but its interesting features deserve mention.^{10,11} It appears in newborn infants between the third and twelfth days of life as an acute purulent conjunctivitis, which may be confused with gonorrheal ophthalmia. Diagnosis is made by the demonstration of characteristic inclusion bodies within cells obtained by gently scraping the hypertrophied conjunctival follicles. From this same material a bacteria-free filtrate may be prepared which will produce a similar disease in monkeys, baboons, and man. In infants the acute stage is usually followed by a prolonged chronic phase lasting many months. The administration of sulfanilamide by mouth, however, produces rapid regression of these lesions.¹² The incidence of inclusion blennorrhoea in large hospitals is approximately 5 cases per thousand live births. Infection of infants probably takes place during parturition, for both the inclusion bodies and the virus have been demonstrated in cells of the maternal cervix. Since virus has also been found in male urethral discharges, venereal transmission among adults is postulated.

In respiratory tract infections, both clinicians and experimental workers are agreed that viruses play some etiologic role. The common cold has been transmitted to man and certain primates with filtered nasal washings obtained from persons in the acute stages of coryza.¹³ Some properties of the virus so isolated have been investigated, but transmission to small animals has not been accomplished and serologic activity has not been recognized. The suggestion has been made that colds are initiated by virus invasion that enhances the pathogenicity of bacterial organisms commonly found in the nasopharynx and allows them to act as secondary invaders.¹³

TABLE 2

Acute Exanthema	Respiratory Diseases
Smallpox and vaccinia	Common cold
Chickenpox	Influenza
Measles	Psittacosis
German measles	
Miscellaneous	Central Nervous System Diseases
Mumps	Rabies
Herpes simplex	Polio myelitis
Inclusion blennorrhoea	St. Louis encephalitis
	Equine encephalomyelitis
	Lymphocytic choriomeningitis

Epidemic influenza has been more amenable to the experimental approach. Virus strains have been isolated which produce pneumonia in ferrets and subsequently in mice. Furthermore, serologic studies can be made, since during convalescence specific antibodies appear in the blood which neutralize virus and fix complement. These techniques have been utilized in several human epidemics, but the results obtained indicate a complex situation. Although the symptomatology may be similar from one epidemic to another, the ease with which influenza virus can be recovered from throat washings varies widely. Elevation of the serum antibody titer is a more regular finding, but even so it is absent in some patients with characteristic symptoms and present in others who remain well. A recent survey of four localized epidemics led to the conclusion that for a given individual a positive diagnosis of viral influenza could be made only if the clinical history was typical, if the virus was recovered from throat washings, and if a significant rise in serum antibody titer was demonstrated.¹⁴

Psittacosis is a respiratory disease of proved virus etiology. In this country its control is effected through supervision of imported tropical birds, which form the chief source of danger for man.

In rabies, too, the main problem of control centers about infection of domestic animals. A number of commercial canine vaccines are available, but their ability to incite an adequate immunity has been questioned.¹⁵ Until preparations of improved potency are available, safety demands that the quarantine and observation of suspected animals be rigidly enforced, irrespective of previous immunization.

Polio myelitis has been subjected to a concerted experimental attack, but so far many fundamental questions remain unanswered. The origin of virus, the exact route by which it gains entry to the central nervous system, the factors that govern the production of paralysis, and the significance of humoral antibodies are all debatable topics. A safe

Discussion

Dr. Josephine B. Neal, *New York City*—It is a real privilege to discuss Dr. Wright's comprehensive paper. I do not see how Dr. Wright covered so much material—and so well—in the time allotted to him. My remarks will be confined to a little elaboration of some of the clinical points which necessarily could not be covered.

In the first place, I should like to speak of epidemic encephalitis—von Economo's epidemic encephalitis. As Dr. Wright pointed out, lethargy and disturbances of vision and various cranial palsies are significant when they are present, but they so frequently are not present. Von Economo himself pointed out that the early cases he studied in Vienna were sent in with a great variety of diagnoses—meningitis, poliomyelitis, psychiatric conditions, etc. When the first cases of encephalitis became recognized around here in New York City, for example in the fall of 1918, the earlier cases in children looked very much like an extremely early case of tuberculous meningitis. All through the years we have been studying encephalitis there has been a fairly large percentage of these meningeal cases both in children and in adults.

The variety of symptoms that may occur in acute encephalitis cover an extraordinarily wide range. While there may perhaps be somnolence, there may, in an equal number of cases, be insomnia, or one or the other may predominate at different times in the same patient. There may be palsies of the cranial nerves, or there may be paralysis of the other nerves. Hemiplegia is by no means uncommon. In children, particularly, convulsions are frequent. These convulsions are often severe and prolonged over a long period of time. Then there may be all sorts of disturbances of speech. In children, in particular, there may be a constant chattering or the child may refuse for some days to speak at all. It is hard

to determine whether it is a refusal on the child's part to speak or whether the child is really suffering an aphasia.

The spinal fluid findings vary widely in epidemic encephalitis. In some instances the findings may be entirely normal, and that may be true even in the more severe forms. In others the cell count is increased, the cells usually showing a preponderance of mononuclears or perhaps polymorphonuclears. That is true in cases of equine encephalitis in man. The protein is usually increased, and the increase in protein continues much longer in encephalitis than it does in infantile paralysis. The spinal fluid sugar is normal or high, and the same may be true in infantile paralysis. In other words, there is little about spinal fluid examinations that helps in making definite diagnosis of encephalitis.

Around New York, while we are not able to have tests carried out on all of our cases to determine whether any St. Louis type or human equine encephalitis is present, sufficient sampling has been done, I think, to make it quite definite that the occurrence of St. Louis encephalitis here in the East has had a low incidence. I have not seen any cases of equine encephalitis in New York City.

I wish to emphasize that clinically we cannot differentiate among these different types of encephalitis, so I urge that serologic studies be carried out, as far as one is able to, in order to rule out the St. Louis type and the equine type. Some doctors have insisted that the onset was so severe in the equine encephalitis type and the residual effects so devastating that one should be able to diagnose it clinically. I have seen just the same conditions in encephalitis that I am sure was not of the equine encephalitis group. I wonder whether the acute stage is really absent in these later years in the patients to whom Dr. Wright referred—for instance, where the chronic stage seemed to go on without a history of an acute stage—or whether the acute stage was so mild that it escaped diagnosis. I think it is often diagnosed as influenza, and I am sure that the acute phase of epidemic encephalitis may be mild indeed.

Lymphocytic choromeningitis in our experience in New York City has been an infrequent disease. Since it was first described in 1935, we have sent a great many serums for neutralization tests and during that time only two have come back showing neutralizing properties. I wish to re-emphasize what Dr. Wright has said about the necessity of making the diagnosis definite, because I am sure that many cases of the meningeal type of encephalitis or non-paralytic types of poliomyelitis have been reported as lymphocytic choromeningitis.

When you're stripped of your enthusiasm
You'll be dressed for the great beyond.
—*Davis Nursing Survey*

The x-ray has disclosed 20 cases of tuberculosis among draftees in the Buffalo area who were not aware they had it.

normally variable. The vaccine has also been used to protect laboratory workers who are in intimate contact with the virus.

Lymphocytic choriomeningitis was first recognized as a disease of man in 1935²⁸. Although the primary attack of this virus is upon mesodermal cells of the central nervous system, a clinical picture of benign encephalitis results. In France, lymphocytic choriomeningitis has been deliberately transmitted to man for the treatment of neurosyphilis²⁷. Subcutaneous injection of virus is followed by a brief incubation period, and then a remittent febrile illness begins. During the first bout of fever, constitutional symptoms that simulate grippe appear, and the virus is present in the blood stream. After fifteen days, approximately one-half the patients develop meningeal symptoms that coincide with the passage of virus into the spinal fluid where it produces increased pressure and a pleocytosis. The meningeal symptoms abate after a few days, and complete recovery follows.

Naturally acquired lymphocytic choriomeningitis probably follows a similar course. Authenticated cases usually have shown an influenza-like prodrome and a pleocytosis exceeding 1,200 lymphocytes per cubic millimeter²⁸. A positive diagnosis cannot be made upon clinical findings alone, but three laboratory methods are available for confirmation: isolation of virus from the spinal fluid, demonstration of complement-fixing antibodies early during convalescence²⁹, and demonstration of neutralizing antibodies late in convalescence³⁰. Complement-fixing antibodies appear about ten to fourteen days after the onset of meningeal symptoms and disappear slowly during the next few weeks. Neutralizing antibodies appear after four to six weeks and may persist for years.

The prevalence of lymphocytic choriomeningitis is difficult to estimate. Only about 25 cases have been completely studied. However, neutralizing antibodies were found in over 10 per cent of a series of 2,500 normal adults³¹. Many of these individuals denied previous central nervous system disease, but they may have had a nonmeningeal form of infection which passed as influenza.

Several types of definite virus encephalitis have been omitted from this discussion because they are not seen in this country except as accidental laboratory infections. The demyelinating forms of encephalitis which occur in rare instances following vaccination against smallpox or rabies have also been

omitted because there is no proof that these complications are due to direct action of the virus upon the central nervous system.

Throughout these remarks no form of specific therapy has been described except for inclusion blennorrhoea. Ordinarily a virus disease cannot be diagnosed until the virus is firmly entrenched within the cells that it preferentially attacks. In this situation it is but slightly affected by therapeutic agents, so that the duration and outcome of the disease depend primarily upon the effectiveness of natural body defenses. Prophylactic measures that attempt to check the virus before it gains such a foothold have yielded better practical results. These include the production of an active immunity, as in smallpox and rabies, protection by passive immunity, as in the exanthems, and control of virus reservoirs in domestic animals, as in rabies, psittacosis, and equine encephalomyelitis. To the pediatrician the advantages of prophylaxis over treatment need no emphasis.

parative studies made in the charts and summary. Each man in the barren marriage group had the following examination:

I. History (Pertinent Data)

A. Name, age, occupation, race, religion, number of marriages, years married

B. Previous illnesses.

1. Childhood.

a. Illnesses and congenital abnormalities

2. Adult illnesses

a. Infections mumps, tuberculosis, gonorrhea and complications, syphilis, nonspecific prostatitis

b. Operations cryptorchidism, hernia, hydrocele, stricture.

c. Injuries to genitalia

C. Weight.

1. Past, present, fluctuations.

D. Habits

1. Alcohol, tobacco, hours and type of work, vacation, exercise

E. Diet

1. Vitamin A bacon, butter, fats, cod-liver oil.

2. Vitamin E cabbage, lettuce, etc.

F. General health.

1. Fatigue.

2. Nervous strain.

G. Occupation.

1. Exposure to x-ray, poisons, etc

II. Family History

A. Siblings and number of their offspring

III. Marital Record.

A. Past marriage (if any)

B. Present marriage.

1. Years married, contraceptive practices, frequency of coitus, dissatisfactions or difficulties, douches or lubricating ointments used, number of pregnancies, miscarriages, abortions, or delayed periods

2. Extramarital pregnancies (?)

3. Previous examination of husband for fertility and previous treatment (if any)

IV. Physical Examination.

A. General appearance, masculine characteristics, weight, height, hair distribution, and physique

B. General physical examination.

C. Examination of genitalia

1. Penis and urethra

2. Testes size, position, and consistency

3. Epididymes size, position, and consistency

4. Vasa size and consistency

D. Prostate and seminal vesicles

1. Size and consistency

V. Laboratory Tests.

A. Urinalysis.

B. Smear of prostatic secretions

C. Wassermann.

D. Semen analysis

MORPHOLOGY OF SPERMATOZOA

FIG 1

Method of Semen Analysis

1. *Collection*—Seventy-two hours or more was advised as a period of continence prior to the collection of the specimen. The patient was supplied with a dry, large-mouthed, glass test tube and was instructed to collect the specimen by withdrawal and ejaculation into the tube. No effort was made to regulate the temperature of the specimen while in transport. All specimens were examined within three hours from the time of collection. When received in the laboratory the specimen was allowed to remain at room temperature, and the following tests and notations were made:

1. The volume was measured in cubic centimeters

2. Notations on appearance and viscosity were recorded

THE MALE FACTOR IN FERTILE AND BARREN MARRIAGE

ROBERT S. HOTCHKISS, M.D., New York City

SEVENTY-TWO years ago the eminent Marion J. Sims addressed this Society on the subject, "The Microscope as an Aid in the Diagnosis and Treatment of Sterility." He had advocated the importance of demonstrating spermatozoa in the semen, and complained that he "was misrepresented, maligned, and positively abused both here and abroad" for his insistence on semen studies. He cited the *Medical Times and Gazette*, which had charged that "this dabbling in the vagina with speculum and syringe was incompatible with decency and self-respect." One-half a century lapsed before his teachings were generally accepted as desirable and ethical, but eventually the obvious truths could not be ignored and the examination of the husband became an essential part of any investigation of barren marriage.

More recently the problem of reproduction has become one of great national concern, for this generation is permitting a serious decline in our national birth rate. Late marriage, contraception, economic stringencies, and curtailment of European immigration are all forces that have depressed our growth. Predictions are made that an actual loss in census will occur in the next few decades. The eugenicists advocate full exploitation of desirable, potential parentage and urge reclamation among the 10 to 15 per cent of marriages that have remained unproductive. A salvage of those who are involuntarily sterile is, therefore, to the best interest of the nation as well as of the individuals.

The vital merits of the endeavor have destroyed the old fastidious antagonisms encountered by our professional forebears, and the approach is now cleared for competent scientific investigations. Remarkable advances have been made in the knowledge of the reproductive faculties of women, but many basic facts remain obscure in regard to men.

Certain theories have now been generally accepted and are regarded as essential principles in the management of marital barrenness. Failure to conceive is more apt to be due to a lowered fertility of one or both partners than to an absolute sterility of either husband or wife. The sum total of the unfavorable fac-

tors may cancel the positive elements of fecundity or may supplement each other in such a way that pregnancy is impossible. Recognition of these defects and a correct interpretation of their *modus operandi* are essential to intelligent treatment.

Man is particularly accessible for complete diagnostic study, for unlike woman his reproductive cells may be secured and examined. The detailed semen analysis has fractionated the semen into elements that are used as criteria for evaluating the fertility. These have been established by laboratory research, animal breeding, and clinical studies of humans. It is now a current practice to measure (1) the volume of the semen, (2) the sperm content, (3) motility, and (4) the morphology of the spermatozoa in the belief that they afford a fairly accurate means of estimating the reproductive worth of the individual.

Each of the criteria has been tabulated in a study of 350 men. Two hundred of this number were husbands of pregnant wives, while 150 were associated with barren marriage. The data concerning the infertile group is presented with full appreciation of the thesis that both husband and wife may contribute to the barrenness and that each may have varying degrees of positive fecundity.

Methods

Consecutive case records were reviewed of men who had been examined for barren marriage by the Department of Surgery (Urology) of the New York Hospital. The Department of Gynecology and Obstetrics had examined the wife of each man, and, if an absolute barrier to conception was discovered in her, the husband was not included in the group. If a multiplicity of defects in the wife warranted the opinion that the cause for the infertility could be assigned to the wife, the record of the husband was withdrawn. One hundred and fifty men were thereupon selected, each of whom had a wife who was either without fault or whose defects could not solely and entirely account for the infertility. The contention is that this group simulates and represents the average couple seeking medical aid for barrenness. The two hundred men of proved fertility were reported in a survey by Brunner, Grenley, and myself in 1938. Reference to this latter group will be confined to the com-

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 9, 1940.

From the Department of Surgery (Urology), New York Hospital, and Cornell University Medical College.

ing drawings will serve as a guide toward the general grouping that was employed (see Fig 1)

The clinical significance of variations in viscosity has not been established. Increased viscosity is often, but not invariably, associated with poor motility and clumping of the cells. Turbidity is usually proportionate to the cell content, and specimens with low spermatozoa counts are less opalescent. The following tables summarize the observations made.

Viscosity (4 omitted)

Increased	26	17.8%
Normal	84	57.5%
Decreased	36	24.6%

Turbidity (5 omitted)

Increased	6	4.1%
Normal	95	65.5%
Decreased	44	30.3%

The data obtained from the semen analyses of the 150 men associated with barren marriage has been tabulated and presented in graph form to permit comparison with the group of men whose wives were delivered of normal children. These are self-explanatory (see Charts 1 to 11).

Discussion

It is apparent that the group of men examined for barren marriage had, in general, poorer specimens than those who were proved to be fertile. The trend is uniform in all categories of the analyses. This would indicate that each of the criteria is important and that not one alone should be used as an indicator. The discrepancy in the values of both groups is not caused solely by the cases of azoospermia, for these were segregated in many instances to avoid such an illusion.

Only 18.6 per cent of the men were without sperm and, therefore, are to be classed as cases of absolute sterility. The remainder, 81.4 per cent, had varying degrees of positive fecundity. In this latter group were some who compared favorably with the fertile men. Likewise, a number of men in the fertile group were poor as judged by these standards. An explanation of this paradox in the former instance is afforded by the acknowledgment that hidden factors in the wife may have prevented conception despite a satisfactory husband. Faulty ovulation, an improper endometrium, or a multiplicity of unfavorable minor lesions may have accounted for the failures. Conversely, the wives of the men who had poor specimens but who conceived probably had ideal reproductive cells and organs conducive to high fertility. This re-emphasizes the importance of interpreting the semen analyses in terms of the findings in the wife.

The higher averages of the fertile group tend to support the theory that the likelihood of pregnancy is increased by seminal specimens of better grades. This is illustrated by comparing the cell count of both groups. The average cell count in the barren group was approximately one-half that of the fertile group. If the cases of azoospermia are omitted, the average count was 75,116,000 per cubic centimeter as compared to 120,630,000 per cubic centimeter of the fertile group.

A comparison of the percentage of cases with low cell counts in the fertile and barren groups is afforded by the following table.

Count per Cc Less than 40,- 000,000	Fertile	Barren	Barren (Less Azoospermia)
	15%	42%	30%

CHART 1

3 The motility was judged and recorded as follows. The readings were taken every three hours during the day until motility had ceased. A disk was placed in the ocular of the microscope which obliterates all but one-quarter of the field. The number of motile cells in the visualized area was counted for ten seconds. The total number of cells was then enumerated, and each number was multiplied by four. The two numbers were placed in fraction form, the numerator being the number of motile cells and the denominator being the total number of cells seen in the microscopic field of a 4-mm objective. The actual percentage of motility is, thereupon, accurately and easily obtained. Grades were assigned to the motility on the following basis of percentage: no motility—Grade 0, 1 to 20 per cent—Grade 1, 20 to 60 per cent—Grade 2, 60 to 80 per cent—Grade 3, and 80 to 95 per cent—Grade 4.

4 The spermatozoa count was expressed in numbers per cubic centimeters. The total number of sperm in the ejaculate was obtained by multiplying the cell count per cubic centimeter by the volume of the semen. Each specimen was thoroughly shaken, and three separate counts were made. If a very few cells were present, no dilution was made. If the cell concentration was obviously reduced, a 1:10 dilution was obtained with a standardized white blood cell pipet, using a fluid consisting of 4 per cent sodium bicarbonate and 1 per cent phenol. A 1:20 dilution was secured if numerous cells were present. The diluent stopped all activity, and the cells were counted in the red blood cell field of an

CHART 2

ordinary blood-counting chamber with a Neubauer ruling. The usual calculations were then carried out according to the dilution used.

5 The morphology of the spermatozoa was studied by classification of the cells into six categories according to the shape of the sperm head. A thin spread of the semen was prepared on a slide, and, while the preparation was still wet, it was passed through the following solutions:

- a. Schaudinn's solution 60 cc.
Mercury bichloride, 7 per cent—40 cc
Alcohol, 100 per cent—20 cc
Time one-half minute
- b. Alcohol, 50 per cent 60 cc.
Time one-half minute
- c. Wash in water
- d. Eosin, 5 per cent aqueous 60 cc.
Time one-half minute.
- e. Acid alcohol 60 cc.
Alcohol, 50 per cent—60 cc
Conc HCl—3 drops.
Time two minutes.
- f. Wash in water
- g. Harris' hematoxylin 60 cc
Standard formula plus
Conc HCl—3 drops.
Time two minutes.
- h. Wash in water
- i. Dilute acetic acid 60 cc
Distilled water—60 cc
Conc acetic acid—3 drops
Time one-half minute
- j. Wash, dry, and examine with oil immersion. If desired, mount in balsam for permanent record

The variety of sizes and shapes of spermatozoa is almost limitless, but the accompany-

CHART 9

CHART 10

the ejaculates of barren men was 189,470,000 as compared with 346,020,000 in the fertile men

8 The average number of oval (normal) spermatozoa in the barren group was 84 17 per cent while the fertile averaged 89 8 per cent

9 Tapering cells (abnormal) were found in a higher average percentage (10 3 per cent) in the barren than in the fertile group (3 6 per cent)

10 Of the barren cases, 13 3 per cent had tapering cells in excess of 24 2 per cent, which was the highest number found in the fertile cases

11 The duplicate cells were the only other abnormal cells having a higher average incidence in the barren than that in the fertile group

12 Certain cases in the barren group had larger numbers of tapering, amorphous, or round cells (abnormal) than in any single case in the fertile men

13 An assay of fecundity should include a consideration of volume, grade of motility, number of spermatozoa, and percentage of abnormal forms

14. The historic and contemporary significances of sterility are discussed

15 The procedures of the clinical and laboratory investigation of the husband are outlined

CHART 11

compiled the statistical data. I wish to express sincere appreciation for his invaluable aid. Mr Ashley Martella used great skill and care in preparing the excellent graphs. His assistance is gratefully acknowledged.

Discussion

Dr John B Horner, Albany, New York—I am glad to have the opportunity to discuss the excellent paper of Dr Hotchkiss. We have indeed progressed and the work presented in this paper is another step.

The profession is now able to point to the potent male partner and say with authority that he, too, may be at fault in a sterile union, even

This study was supported in part by a grant from the National Committee on Maternal Health. Mrs Elizabeth Hoffman, B.S., M.S., ably assisted in performing the laboratory work. Mr William S Goldfarb, B.S., M.S.,

CHART 5

CHART 6

CHART 7

CHART 8

The graphs illustrating the morphology are particularly significant for their distribution and range. The oval spermatozoa are regarded as normal. The greatest variation in incidence of the abnormal cells was in the narrow and tapering forms (Chart 7). In the fertile men the highest number of these encountered was 24.2 per cent. In the barren group as many as 69 per cent were found in 1 case. Fourteen cases (13.3 per cent) had more than 24.2 per cent, which was the upper limit found in the fertile men. The only other abnormal cell found to have an average, higher incidence in the barren group was the duplicate cell.

Summary and Conclusion

1 Detailed analyses of the semen of 150

men examined for barren marriage are herein reported.

2 The analyses are compared with those formerly obtained in 200 fertile men whose wives were in the first half of gestation.

3 The volume of ejaculate averaged 3 cc in the fertile group and 2.9 cc in the barren group.

4 The average grade of motility was poorer in the barren than the fertile group.

5 The spermatozoa count averaged 64,100,000 per cubic centimeter in the barren group as compared to 120,630,000 per cubic centimeter in the fertile group.

6 Omitting cases of azoospermia the average cell count in the barren group was 75,116,000 per cubic centimeter.

7 The average number of spermatozoa in

REGIONAL ENTERITIS

Report of Two Cases

IRWIN E. SIRIS, M.D., New York City

THE increasing clinical recognition of regional enteritis now established as a distinct clinicopathologic entity can be attributed to the painstaking coordinated effort of the clinician, the roentgenologist, and the pathologist. Crohn, Ginzburg, and Oppenheimer's¹ exhaustive investigation of 14 patients in 1932 stimulated renewed interest in inflammatory segmental regional enteritis. They characterized the disease then as a nonspecific, subacute, or chronic necrotizing and cicatrizing inflammation of the ileum occurring predominantly in young adults. Their concept revived interest in the nonmalignant, inflammatory intestinal tumors of obscure etiology vaguely termed "benign granuloma." Since the publication of their article other observers and Crohn himself have reported similar nonspecific inflammatory processes in other parts of the small intestine and in the colon, and the combination of ileitis and colitis has been described. The all-inclusive clinicopathologic studies of Crohn and his associates has been corroborated in part or in its entirety by many contributions to the subject embracing a large number of case reports, which serve to clarify some phase of the disease.

The first patient we are reporting was operated upon in 1934. The diagnosis was a chronic, hyperplastic ileocolitis apparently of nonspecific origin, although tuberculosis could not be ruled out. The consideration of a tubercular origin could not be established and was therefore questionable. The satisfactory result following surgical excision prompted this case report, as it seems unlikely that the disease could have been effectively treated by nonoperative methods.

M. A., a white single woman, aged 22, a stenographer, was seen on July 5, 1934, and complained of cramplike pain in the right lower quadrant, diarrhea, weakness, and progressive loss of weight. For a year she had been complaining of a pressing pain in the epigastrium which occurred shortly after eating and which invariably was followed by a cramplike pain in the abdomen and a loose, offensive bowel movement. The stools did not contain blood or mucus. These symptoms would abate for periods

of a few days but recurred with increasing intensity, especially so during the month before admission. There was progressive loss of weight, restlessness, and considerable apprehension, particularly at night. During the night before admission she had a chill followed by a temperature of 103 F. During her childhood she had measles, scarlet fever, and whooping cough. There was also a history of a mastoid operation during infancy. Her three brothers and her sister were well.

On admission to the Beth Moses Hospital, the patient appeared acutely ill, pale, thin, and undernourished. She weighed approximately 90 pounds. Her temperature was 103 F., pulse rate, 120, respiratory rate, 20. The pupils were equal and reacted to light. The mucous membranes of her mouth were pale. There was a partial paralysis of the left side of her face. The chest was of the asthenic type, there were no adventitious lung or heart sounds. The abdomen was soft, the liver extended just below the costal margin. There was some fullness in the right lower quadrant which was vaguely tender and which suggested the presence of a mass which, however, was not constant.

Laboratory Data.—The urine examination on admission showed a trace of albumin. The blood contained 6,000,000 red blood cells per cubic millimeter. The hemoglobin content was 70 per cent with a color index of 0.6. There were 26,000 white blood cells, of which 85 per cent were polymorphonuclear leukocytes and 15 per cent were mononuclear cells. The Wassermann and Rosenthal tests were reported negative. Further blood examinations disclosed sugar, 90, urea nitrogen, 17, and a total cholesterol of 145 mg. per hundred cubic centimeters of serum with 20 per cent cholesterol ester. Repeated stool examinations were negative for parasites and acid-fast bacilli on smears and cultures. Gastric analysis by the fractional method disclosed the presence of blood in each specimen with some bile and an average total acidity between 6 and 8 with an absence of free hydrochloric acid.

Proctoscopic and sigmoidoscopic examinations revealed the presence of a glistening mucous membrane that was pale but presented no evidence of ulceration.

Radiographic Examination.—The chest films showed diffuse bilateral accentuation of the pulmonary markings and interlobar septal thickening between the middle and lower lobes of the right lung. The apices and general peripheries were clear of any infiltration or consolidation.

Read before the Brooklyn Surgical Society, November 7, 1940.

though a large number of motile spermatozoa are found in a sperm specimen or in the vagina

Painstaking work and records of the type presented by Dr Hotchkiss have given us a standard against which we can judge a specimen. We can all easily and quickly take a history and examine the patient if we bear in mind the causes—local, general, and endocrine—of lowered fertility. We can just as easily do a sperm count and stained smear.

In the matter of obtaining the specimen, I think the use of condom during intercourse gives the most satisfactory sample, but it should be one that has been washed before use. As to the time of examination, it would seem the earlier the better, but then, of course, you would have to remember that the motility chart would depend upon when the first examination was made.

A good many tests—chemical and otherwise—are used, such as, checking the pH, the buffer capacity, the glucose content, etc., but they have either proved to be of no value or check so closely with the cell count and morphologic assay that they are not valuable aids.

Lowered cell count and motility with an in-

crease in abnormal forms are not a proof of sterility but rather a proof of some fault of the genital tract—toxic or otherwise—which may be sufficient to render the sperm infertile.

And so we come to the inevitable conclusion that, in the specimens that fall short in one way or another, the normal appearing motile spermatozoon, of which there may be millions, are deficient in something necessary for fertilization. In this group are patients whose wives become pregnant but abort early, and this, too, may be the fault of the man rather than the woman.

In my experience by far the largest percentage of deficient sperm specimens have come from the tired, overworked, nervous individual and were, I believe, due to toxemia. We place the most reliance on the morphologic assay and recheck any counts several times when the morphology is normal.

As to treatment, the patient should be treated for the cause of the disability, whether it be local or general, and not by indiscriminate use of endocrine products unless there is a discernible endocrine deficiency. I wish to congratulate Dr Hotchkiss for his contribution.

NIGHT OVER EUROPE

Perhaps the most frightening aspect of modern war is the intellectual blackout it creates, observes the annual report of the Rockefeller Foundation. When the war broke out in September, 1939, the Foundation had 110 running appropriations in Europe, distributed in twenty-two countries, involving over \$4,000,000. Some of this extensive medical and health work has been able to go on, but at the time of the report, notes the *Medical Record*, the University of Warsaw has ceased to exist. According to reliable reports, the entire Polish faculty of the University of Cracow is in a concentration camp. The Polish members of the faculty of the University of Vilna have been dismissed. The Moors, entrenched in the ruined University of Madrid, have used the books from the University library as defenses in their rifle pits. The University of Prague has been shut by the German Government. The University of Strasbourg has been torn from its site and planted in Clermont-Ferrand. For reasons of economy and because their students are in military service, more than half the universities of Germany are closed. What will be the next report of the Rockefeller Foundation which will comprise the events of the fateful summer of 1940?

THE DOCTOR IS SURE OF A LIVING

Medicine probably is the only field today in which a well-educated graduate is sure of making a living and also of having security if he carries disability, life, and old age insurance, says Dr Wilburt C. Davison, of Durham, North Carolina, in the *JAMA*. Except for crowding in the larger cities, there is no unemployment problem for American medical graduates. Although he will not make a fortune, as large medical incomes may be a thing of the past, the average physician's income at present probably is at its highest level.

According to national figures, 30 per cent of the three and one-half billion annual total cost of medical care is for physicians, or \$3,800 net per physician. However, this net figure is based on many physicians who are not in practice, and the correct average net income probably is higher. "Average incomes" may be misleading.

A few large incomes do not help the physician who is not earning enough to enable him to maintain the standards of good practice. However, physicians with extremely high and low incomes are in the minority, no physician's income can be compared with those of the leading lawyers, but physicians have not found it necessary to seek other fields to eke out an existence, as is the case with some lawyers.

ONLY A BLIND

A patient in a hospital awoke after an operation and found the blinds drawn in his room.

"Why are those blinds down, doctor?" he asked.

"Well," said the physician, "there was a fire in the alley, and I didn't want you to wake up and think the operation had been a failure."

—*Davis Nursing Survey*

AMPLE SLEEPING QUARTERS

The doctor met Mrs. Brown on the street. "How is your husband now?" he asked. "Did you give him the sleeping powder?"

"Yes," she replied. "You told me to give him the amount I could get on a quarter, but as I didn't have any, I used twenty-five pennies, and he's been asleep now for four days."

FIG 2

FIG 2 M A, erosion of the mucosa with cellular infiltration in submucosa and muscularis, granulation tissue in the serosa

FIG 3

FIG 3 M A, involvement of muscularis and serosa of proximal grossly involved ileum

the ileum there is an area with marked thickening and firmness. This area measures 2 cm in diameter. The dense connective tissue band passes from the inferior portion of the transverse colon to the ileocecal region in the area of the colonic adhesions to the ileocecal mass. The villi of the ileum are prominent and swollen. There are numerous longitudinal areas of ulceration with tabs of exudate adherent to the ulcerated surfaces. The nearer one goes to the ileocecal valve, the thicker is the wall of the ileum, until finally it becomes incorporated in a mass and then measures 3 to 4 cm. The ileocecal valve barely admits the tip of the small finger. The muscularis in this region is markedly increased in width and presents numerous grayish bands running in irregular fashion throughout the muscular coat. At times the muscular coat measures slightly more than 1 centimeter in thickness. The proximal half of the appendix is included in the same mass. The distal half is adherent to the inferior surfaces of the ileum. The mucosa of the proximal half is also polypoid in character, whereas the mucosa of the distal half presents a normal appearance. The thickness of the appendix consists mainly of thickened serosa. The mass presents a firm consistency and on cross section reveals a pearly gray mass of firm tissue with areas of yellowish strands running in irregular fashion throughout the mass. Small tubercles, from pin-point- to pinhead-sized areas are also present. A few enlarged lymph nodes are present. These merely present a succulent appearance with no characteristic alteration of structure.

Microscopic. The entire wall is thickened. Granulation and dense connective tissue with mononuclear cells and leukocytes are present in all coats, especially in the serosa. A number of granulomas with Langhan's and foreign body, giant cells are present in all coats. A few of the granulomas show necrosis of the central areas, although caseation necrosis is not present. Acid-fast bacilli are not found in any of the sections (Figs. 2, 3, and 4).

FIG 4. M A, foreign body, giant-cell reaction in fistulous tract

Diagnosis Chronic hyperplastic ileocolitis is apparently of nonspecific origin, although tuberculosis cannot be ruled out.

Subsequent Course—The patient gradually gained in weight with improvement in her appetite and general well-being. However, there was a persistent discharge from the sinus in the lower angle of the incision. One year later on September 11, 1935, radiographic study of the abdomen, following the ingestion of lipiodol into the sinus, revealed a communication into the abdominal cavity—apparently, however, not communicating with a hollow viscera. Within six months the sinus closed and has remained healed. On October 16, 1940, during the administration of a barium enema, the contrast medium was found to flow readily into the colon and intermittently empty into the ileum through the new stoma. There was no evidence of cicatrization. The proximal transverse colon was found to have veered sharply to the right

Fig 1 M. A., July 23, 1934. Irregular filling defect of the cecum. The terminal ileum is stringy

On July 12, following the administration of a barium enema, the colon, with the exception of the caput cecum, appeared normal in outline. The cecum was constricted at its lowest border in addition to a small segment of the ileocecal junction.

On July 23 radiographic examination after the ingestion of a bariumized meal disclosed an irregularly constricted filling defect in the lower aspect of the cecum (Fig 1). The colon was visualized throughout with the exception of the cecum and parts of the proximal ascending colon. These findings suggested some benign inflammatory process involving the terminal ileum and caput, possibly secondary to an extrinsic inflammatory process.

In view of the increasing frequency and intensity of the intermittent abdominal cramps, epigastric distress, diarrhea, loss of weight, palpable mass, and the persistent defect in the cecum, with recurring daily temperature to 102 F, surgical intervention was considered justifiable. Preparation for the operation consisted of general supportive treatment and a transfusion of 500 cc. of blood given on the day preceding the operation.

Operation.—On July 27, the operation was performed under a general anesthetic. A long right rectus incision was made to permit adequate

exposure of the mass that was found to involve the cecum and ascending colon. The peritoneum presented a mottled hemorrhagic appearance, and over the ileum there were shaggy fibrinous tabs, markedly vascular. The tumor was approximately 4 by 3 inches in diameter and firmly adherent to the anterior abdominal wall. About 8 inches of the terminal ileum was plum colored, leathery in consistency, curled upon itself, hyperplastic, and adherent to the proximal half of the transverse colon which in turn was thickened and firmly adherent to the terminal ileum along its inferior mesenteric border. The terminal ileum, ascending colon, and proximal two-thirds of the transverse colon were resected. The divided ends were closed with three layers of sutures. The terminal ileum and the distal third of the transverse colon were approximated by a side-to-side anastomosis with an inner layer of chromic and an outer layer of fine Pagenstecher. The defect in the posterior peritoneum was closed. A Penrose drain was inserted about an inch beyond the anterior abdominal wall, and the abdominal incision was closed in layers. A transfusion of 500 cc. of blood and 5 per cent glucose and saline were administered during the operation.

Postoperative Course.—The first four days were stormy, the temperature was elevated to 104 F, and the pulse was exceedingly rapid, at times as much as 160 beats per minute. After the fifth day the temperature and pulse rate gradually approached and remained within normal limits. Intermittent Wangenstein siphonage was effectively established. On the fourth day she had three loose bowel movements in twelve hours. The wound showed evidence of infection on the third day. The discharge gradually increased in amount until the eleventh day and thereafter diminished but persisted in small amounts even up to the time of her discharge from the hospital. The patient was discharged on September 14, two months after admission, weighing 80 pounds, 10 pounds less than when she was admitted. During her convalescence she was on a high-vitamin diet with iron and malt. Her stools, occasionally two a day, were well formed and normal in color, without any evidence of blood or mucus.

The pathologic findings as reported by Dr. A. Kantrowitz, director of laboratories, was as follows:

Gross. Specimen consists of 30 cm. of terminal ileum and 28 cm. of ascending and transverse colon. In the region of the ileocecal valve there is a mass 6 cm. in diameter. This is present in the ileocecal angle and includes both the ileum and proximal portion of ascending colon. The transverse colon is adherent to this mass. The peritoneum over the mass is markedly injected in areas and presents a mottled hemorrhagic appearance. The peritoneum over the distal portion of the ileum is in large numbers of shaggy fibrinous tabs with well-marked vascularization. Twelve centimeters from the resected portion of

FIG 7

Fig 7 M. K., August 4, 1938 Hourly, barium, small intestinal studies show in the last 8 inches of ileum a persistent stringiness with fraying of the small intestine as it is encroached upon by an extrinsic mass

FIG 8

Fig 8 M. K., November 5, 1938, eighty-four days after the ileotransverse colostomy, bariumized, small intestinal study reveals a faint, ill-defined and stringy, moth-eaten appearance of lowermost coils of ileum The right lower quadrant is partly devoid of ileum.

Medially to the iliac crest there was a palpable mass approximately the size of a large apple, relatively soft in consistency, and tender on deep pressure. Slight rebound tenderness was readily elicited over this area. On rectal examination a large, boggy soft mass was palpable, extending from the right side to well beyond the midline finger. No blood or mucus was found on the examining examination the mucous membrane was found glistening, but no ulceration, blood, or mucus was observed.

Laboratory Data—The urine examination was negative. The blood contained 4,100,000 red cells per cubic millimeter. The hemoglobin content was 11 Gm. There were 16,200 white cells, of which 72 per cent were polymorphonuclear leukocytes and 28 per cent were mononuclear cells. The Wassermann and Rosenthal tests gave negative results. The examinations of the stools failed to reveal ameba or acid-fast bacilli.

The barium studies were reported by Dr. Louis A. Held. He demonstrated that the bariumized clysmas flowed easily into the colon and presented a markedly irregular, moth-eaten, persistent filling defect in the mesial aspect of

the cecum and proximal ascending colon (Fig. 6). There were moderately gas-distended, terminal coils of ileum which appeared persistently to approximate the mesial border of the ascending colon. Five days later hourly studies of the small intestine following the ingestion of a bariumized meal revealed that approximately the last 8 inches of ileum disclosed a persistent stringiness together with a distinct fraying of the external border of an additional 4 inches of small intestine immediately above as if encroached upon by some extrinsic mass (Fig. 7). The barium enema and fractional small intestinal studies indicated some form of inflammatory process involving the lower 8 to 10 inches of the terminal ileum and the mesial border of the cecum. While the nature of the lesion was not conclusively established, the presence of a regional enteritis or some benign inflammatory process (pericecal abscess) affecting the hollow viscera in the right lower quadrant was strongly suggestive.

During the thirteen days in which the patient was observed, the clinical course varied from periods of regression to those of exacerbation of symptoms. At times the abdominal mass seemed less tender and the rectal mass smaller

FIG 5

FIG 5 M A, October 16, 1940, six years after resection, contrast mediums flowed readily into the colon and intermittently emptied into the ileum through the new stoma. The transverse colon veered sharply to the right side

FIG 6

side of the abdomen (Fig 5) About 75 per cent of the contents of the colon was readily evacuated. Within twenty-four hours no trace of the barium was visible The patient weighed 124 pounds, she has continued uninterruptedly at her work for the past four years She has had two and, occasionally, three soft bowel movements daily This she attributes to her inability to obtain proper food while at work She has had no abdominal cramps, nor has she observed any blood or mucus She has a very good appetite and believes that she is in excellent health

The second case presented a walled-off abscess following a perforation into the peritoneal cavity, this complicated the diagnosis and the technical management This case is also illustrative of the extent to which the peritoneal cavity was immunized in the presence of the discharging sinus from the mesenteric abscess. A comparatively uneventful convalescence followed resection of the diseased ileum and ascending colon

M K, a white married man, aged 32, a mechanic, was admitted to the Beth Moses Hospital on July 30, 1938 His chief complaint

was intermittent abdominal cramps. He has been married eleven years and his wife and two children have been in good health For the past three years he had had frequent bowel movements with occasional episodes of severe abdominal "cramps," which could, at times, be controlled with tincture of opium In another institution he had had frequent proctoscopic examinations, and there received a course of autogenous vaccine twice yearly On the day before admission the abdominal cramps were intense and gripping in character such as he had never before experienced. He was nauseated and vomited, but there was no bowel movement. Tincture of opium did not relieve his pain, which seemed to radiate across his abdomen to the precordium and then migrate down the midline to the suprapubic region.

Examination The patient was pale, thin, acutely ill, and he seemed in distress His temperature was 102 F, and his pulse was 88 His ribs were very prominent, and he had deep supraclavicular fossae The lungs were clear, and the heart sounds were apparently normal The abdomen was moderately distended with some appreciable resistance on the right side as compared with the left, there was no rigidity

with 75 Mg. of cholesterol ester essentially negative The urine was

Radiographic fractional studies after the ingestion of a thin bariumized meal revealed that although the stomach emptied its contents in four hours the progress of the bariumized contents through the small intestine was sluggish. The ileal coils showed slight overdistention and were situated rather high in the abdomen. The right lower quadrant seemed devoid of ileum throughout the examination with the exception of intervals at the fourth, sixth, and tenth hours, at which time a faint ill-defined and stringy, moth-eaten appearance of the lowermost coils of the ileum was evident (Fig 8). A section of ileum approximately 10 inches from the terminal end appeared persistently approximated to the transverse colon some distance beyond the hepatic flexure. The barium contents flowed into the colon and back into the ascending colon as well as into the distal colon. The cecum was not visualized. The ileocolostomy stoma was noted. From this observation it appeared that the last 12 or 18 inches of ileum were involved in the inflammatory infiltration, which seemed to be within or around a soft tissue density occupying the right lower quadrant. The studies with the bariumized clysmas were unsatisfactory, as the patient complained of great discomfort when the barium would approach to the splenic flexure. From that point there was no satisfactory definition of the colon except that the hepatic flexure and some small intestine occupied a crowded position in the right side of the upper part of the abdomen and showed appreciable gas pocketing. The right lower quadrant was devoid of any intestinal presence at all.

During the seven days preceding the second operation his temperature, pulse, and respiration were normal, there were only occasional complaints of abdominal cramps and loose stools. On November 3, a transfusion of 500 cc of blood was administered. The presence of the tender ectal mass and a persistent discharge from the sinuses presented definite evidence of an infection on which, it was realized, might precipitate a generalized peritonitis. However, it was felt that the condition offered a poor prognosis unless the disease was eradicated. Confidence in the immunization of the peritoneal cavity in combating the infection over a period of months, particularly after the trauma of the first operation, warranted taking further steps to remove the diseased segment of intestine.

Operation.—On November 8, 1938, twelve weeks after the first operation, under spinal anesthesia with 200 mg. of neocaine, the two sinuses and the old scar were excised en masse down to the peritoneal cavity. There was no evidence of free pus or other fluid in the peritoneal cavity. The cecum, ascending colon, and approximately 10 inches of terminal ileum were firmly matted together, the latter being directed downward and then upward including a diffusely indurated mesentery of the small intestine

The terminal ileum was indurated, leathery, and doughy in consistency and purplish blue in color and was covered with dull grayish flakes. The ascending colon was red and edematous but did not have the induration, consistency, or color of the ileum. The conglomerate mass was adherent to the wall of the right side of the true pelvis, the bladder, and to the lower sigmoid just above the beginning of its pentoneal reflection.

The ascending colon was separated from the anterior and lateral parietal peritoneum and reflected mesially. The hepatic flexure was separated from the duodenum to which it was firmly adherent. The right ureter was exposed. The transverse colon, 2 inches proximal to the ileocolostomy, was divided between clamps, as was the terminal ileum, 2 inches distal to the stoma. The mesentery was divided between clamps. The divided ends of the intestine were closed with four layers of sutures. The defect in the posterior parietal peritoneum was closed, partly with omentum. A small Penrose drain was inserted 1 inch within the pentoneal cavity. The abdominal wound was closed in layers with interrupted sutures. During the operation the patient received a transfusion of 500 cc of blood.

Postoperative Course.—The general condition of the patient during and after the operation was satisfactory. For the first five days his temperature did not reach 100 F, and his pulse remained below 100 beats per minute. There was no nausea, vomiting, or distention. He received parenteral fluids for five days and no fluids by mouth. On the sixth day his temperature was 100.2 F, pulse, 108, respiration, 24, a slight foul purulent discharge was evacuated from the lower angle of the wound. On this day he had a well-formed, dark brown stool. The discharge from the wound lessened, in fact it was never profuse and did not affect the healing of a firm wound.

The pathologic findings as reported by Dr. A. Kantrowitz were as follows

Gross Specimen consists of 90 cm. of terminal small intestine and 25 cm. of cecum and ascending colon. The ileum is somewhat dilated. The serosal surface is considerably roughened because of numerous connective tissue tabs. This is an especially prominent feature the nearer one approaches the cecum. The terminal loop of ileum presents an L-shaped appearance due to marked connective tissue adhesions between both arms of the loop, rendering the separation of both arms extremely difficult and almost impossible without perforating the individual loops. The cecum and ascending colon show adhesions to the contiguous portion of cecum. The mesenteric sinuses are markedly thickened and present a firm consistency with a pearly gray appearance. The terminal loop is also adherent to the wall of the cecum and ascending colon, measuring 4 cm. in length and 2 cm. in thickness. A sinus tract is present in this area, and a probe can be passed

The temperature fluctuated daily between 99 and 101 F, on the sixth day the white cells were 10,800 with 71 per cent polymorphonuclear leukocytes. The patient, however, continued to complain of intermittent, abdominal, griping cramps, waning appetite, and frequent loose stools. His general condition indicated that he was not improving. The impression based on the radiographic and clinical observations was that we were confronted with an inflammatory segmental enteritis with probable perforation into the mesentery which was associated with a walled-off abscess. It was realized that the presence of an abscess would preclude extirpation of the diseased segments of intestine. The alternative was to divert the fecal stream and place the inflammatory process in the intestine as near inertia as possible by performing a transverse ileocolostomy. It was felt the intestinal anastomosis would entail certain risk in the presence of infection, but in view of underlying pathology and prolonged autoimmunization it appeared justifiable to subject the patient to the operation.

Operation—On August 12, 1938, the operation was performed under spinal anesthetic using 200 mg of neocaine. The abdomen was opened through a long right rectus incision. A large mass was found adherent to the pelvis and to the anterior and lateral abdominal wall. It consisted of several inches of the terminal ileum firmly adherent to the mesial surface of the cecum and ascending colon. The inflammatory process seemed to be confined essentially to approximately 8 to 10 inches of the terminal ileum, which was thick, leathery in consistency, and purplish blue in color. Its mesentery was about 2 inches thick, partly necrotic, encasing about 3 ounces of thick, yellow, odorless pus that had perforated from the inner side of the ascending colon. There were numerous enlarged glands in much of the rest of the mesentery. The cecum and ascending colon were moderately thickened but apparently not involved or involved to any degree in consistency and color as the terminal ileum. The appendix was 3 inches long, was situated on the lateral wall of the cecum, and was not adherent and not involved to any extent in the diseased process. About 10 inches proximal to the diseased ileum, the ileum was sutured to the middle of the transverse colon. The pus in the abscess cavity was evacuated, and a Penrose drain was inserted to the base of the abscess. The abdominal wall was closed in layers with interrupted sutures. During the operation the patient received 1,000 cc of 5 per cent glucose in saline followed by 500 cc of blood.

Postoperative Course—The patient's immediate postoperative reaction was satisfactory. Intermittent Wangenstein siphonage was effectively established. Parenteral fluids were administered for several days. On the first postoperative day his temperature was 101.8 F, pulse rate, 116, respiration rate, 22, and his

abdomen was soft. On the third day he received a transfusion of 350 cc of blood. On the fifth day his temperature rose to 103.2 F, and there was evidence of profuse drainage from the incision. Three days later the temperature was normal, and the discharge from the wound was beginning to lessen in amount.

The smear from the pus evacuated from the abscess at the time of operation disclosed gram-negative bacilli and gram-positive cocci in chains. The culture was reported as demonstrating bacilli coli and enterococcus.

On September 3, twenty-one days after the operation, the discharge from the wound was a light yellow-brown, suggestive of feces. Rectal examination revealed a mass of about the same proportion as before the operation, hard, moderately tender and bulging into the rectum. During the ensuing three weeks his temperature would occasionally rise to 102 F. The stools were soft, yellow in color, and averaged three evacuations daily. At times there was almost continuous diarrhea, which was refractory to treatment. At no time was there gross evidence of blood or mucus. He seemed apprehensive because of loss of weight and lack of appetite. On September 22, his red blood cells were 3,700,000, his hemoglobin, 11 Gm, white blood cells, 8,400, with 80 per cent polymorphonuclear leukocytes.

On September 30, forty-nine days after the operation, he was discharged to a convalescent home in an effort to improve his general condition before subjecting him to the operation for removal of the diseased segment of intestine. For several days before his discharge the temperature had been relatively normal, the discharge from the sinus was scant, the rectal mass was somewhat smaller, the stools were less frequent, and his general condition was much improved.

Readmission Note—On November 1, 1938 one month after his discharge from the hospital he was readmitted because of frequent recurring attacks of violent colicky pains a few hours after his evening meals. These pains were always associated with distressing episodes of belching. For two to three weeks he had had one or two fairly soft formed stools daily. There were no episodes of nausea or vomiting. He had had no urinary symptoms. He weighed on readmission 102 pounds, a gain of 20 pounds since his discharge. There are two discharging sinuses in the lower part of the operative incision from which there had been a slight but persistent purulent discharge. The tumor mass was readily palpable in the lower abdomen and on rectal examination. Pressure on the rectal mass would express some pus from the sinus.

The blood on his readmission contained 4,800,000 red cells per cubic millimeter, the hemoglobin was 13 Gm., the white cells were 14,720 with 82 per cent polymorphonuclear leukocytes. The sugar was 75, the urea nitrogen, 11, the cholesterol, 155 per 100 cc of serum.

Conclusions

In both patients the salient features of regional enteritis were encountered in which the chief presenting clinical manifestations were cramplike intermittent abdominal pain associated with diarrhea, variable fever, loss of weight, and a palpable mass in the right lower quadrant. In both, symptoms of partial obstruction became superimposed on a partially stenosed intestine.

The first case represented a subacute hyperplastic ileocolitis with involvement of both the terminal ileum, cecum, and ascending colon, with uneventful recovery following a one-stage resection. The presence of giant cells and small tubercles in the granulomatous tissue was suggestive of tuberculosis, but no acid-fast bacilli or caseation necrosis was present. The second case illustrated a perforated regional ileitis with abscess formation treated by a transverse ileocolostomy and drainage. Twelve weeks later the diseased bowel was successfully resected. The inflammatory process was an exudative, hyperplastic, stenosing lesion of the terminal ileum which ended abruptly at the ileocecal valve but involved the mesentery and had perforated into a walled-off abscess.

FIG 11 M. K., October 15, 1940, almost two years after resection, both the colon and terminal ileum are normal in contour and demonstrated intermittent contractions. The colon to the right of the stoma has grown and veered to the right. There is no evidence of cicatrization.

BELIEF IN DREAMS NOT ENTIRELY FALSE

Those who believe in the power of dreams to foretell future events may not be entirely wrong, Dr. Smiley Blanton, New York City, points out in *Hygeia, The Health Magazine*. Although a dream is not a supernatural omen, he says, it "may be prophetic in that it expresses something that we are consciously or unconsciously striving for and may attain."

While dreams express our strongest wishes, it requires proper study, often by a trained psychiatrist, to reveal their true meaning. "The study of dreams," Dr. Blanton explains, "must consider two matters: (1) the dream itself, as it is remembered when the sleeper wakes up, and (2) its deeper meaning, hidden in the unconscious mind, concealed there by distortion, disguise, and symbolism."

"To get at this hidden meaning of our dreams, we have to go back to our childhood and trace briefly the mental development of the child. As he grows into a normal, moral, social being, the child is under constant necessity to put aside his selfish, dominating tendencies, but these remain in the unconscious mind, which stores

every experience from birth to death. These primitive, childish, selfish impulses are censored by our consciences and come out disguised, distorted and concealed. They may best be studied in our dreams."

"A means of concealment in dreams is symbolism. A familiar use of symbolism occurs in everyday language in which many symbolic words are used. The slang expression for money is 'dough', for dollars, 'iron men', and for \$1,000, 'a grand.' Similarly, we may dream of a lump of dough, meaning money, a series of toy iron soldiers, meaning dollars."

"The unconscious mind very often has a truer comprehension of our difficulties than our conscious mind has. A dream may often express a fear of illness, a fear which is based on an awareness in the unconscious mind that we are threatened with an illness, or that we are already suffering from this illness."

"Dreams are a safety valve. Life requires many renunciations that must be compensated for, and dreams are the royal way in which this is accomplished."

FIG 9

FIG 9 M K, wall of abscess cavity

FIG 10 M K, early involvement of mucosa and submucosa in proximal ileum, approximately 65 cm from the ileocecal valve

through an exit on the other side of the U mass, making its exit in the mesentery. An opening cannot be traced into the lumen. This entire loop forms a mass that is approximately the size of a grapefruit. The proximal 50 cm of small intestine show an essentially normal thickness and normal mucosa. At a point 40 cm from the ileocecal valve and extending for approximately 15 cm, the wall is of normal thickness, but the mucosa presents a few punched-out areas of irregular size and shape ranging up to 2 cm in length. The margins are somewhat heaped up. The excavated areas present a reddish brown color. A number of these areas show islands of mucosal tissue surrounded by areas from which the mucosa has been denuded. At approximately 25 cm from the ileocecal valve, together with the punched-out areas (which, by the way, become considerably increased in number and size and show considerable irregularity in shape), the wall becomes increasingly thick. In portions the eroded areas are larger in extent than the surrounding areas in which the surface is covered by mucosa. The wall in the terminal portion measures up to 2 cm in thickness. The thickening and erosion of the ileum end very sharply at the ileocecal valve. Whatever thickening occurs in the wall of the cecum and ascending colon is due to the surrounding pericecal and pericolonic adhesions. The wall itself does not partake of any increase in size. The appendix measures 10 cm in length and up to 0.8 cm in diameter. The lumen of the distal 2 cm is obliterated.

Microscopic All coats of the terminal ileum show considerable thickening. The increase in the size of the various coats is due to a number of causes, viz, edema, connective tissue scarring, and infiltration with mononuclear and polynuclear cells. The cells appear in large and small collections or are diffusely scattered. The mucosa shows numerous erosions with granulation tissue forming the surface. The sinus tract found in the mesentery is lined by granulation tissue and purulent exudate. The inflammatory process ends abruptly at the ileocecal valve.

The proximal ileum and colon wall show no changes (Figs 9 and 10).

Diagnosis Regional ileitis.

On his discharge from the hospital on December 11, thirty-four days after the resection, the wound had been healed for several days. When he was first permitted out of bed on November 20, he weighed 92 pounds. On discharge he weighed 103 pounds. He was having two soft bowel movements daily, not associated with any abdominal cramps. His appetite was good and he felt that he was regaining his strength.

Subsequent Course—Since his discharge from the hospital he has had occasional abdominal cramps, and these always followed gross indigestion in his diet. Radiographic studies have been made about every six months, none of which has shown any recurrence of the disease. The patient has been able to resume the same physical activities as before his illness. His appetite at times is not good, at other times it is ravenous. He is on a high carbohydrate diet, liver, and vitamin B. The patient has had two loose stools a day and has not noticed any gross blood or mucus. He has two internal hemorrhoids which cause some pain if his stools are hard. He now weighs 110 pounds, which is as much as he has ever weighed. His one complaint is that he cannot put on more weight. The last radiographic studies made on October 15 and 16, 1940, indicated that the barium flowed readily through the colon. It showed that both the colon and terminal ileum were normal in contour and demonstrated intermittent contractions. The colon to the right of the stoma had increased in size and followed a course along the liver and then turned downward for a short distance to simulate a short ascending colon. There was no evidence of cicatrization (Fig. 11).

structures. It is probably the major source of supply.

The ascending pharyngeal artery is apt to be underestimated in its importance, and when it is the cause of hemorrhage from the nasopharynx a ligation of the external carotid artery at the bifurcation may be necessary. The ascending pharyngeal artery arises near the lingual artery and proceeds upward between the external and internal carotid arteries, then changes its course to lie between the internal carotid artery and the pharyngeal wall. In all instances where a hemorrhage from the internal carotid artery is suspected, especially when the hemorrhage is secondary to a pharyngeal infection, it is wise to ligate the ascending pharyngeal artery before tying the internal carotid artery. If the bleeding is stopped by ligating the ascending pharyngeal artery, a much more serious ligation of the internal carotid artery may be avoided. This artery supplies the pharynx, palate, and dura.

The internal maxillary artery is the more important of the two terminal branches of the external carotid artery (superficial temporal and internal maxillary). It arises from the bifurcation of the external carotid artery located just inferior to the lobule of the ear where the internal maxillary artery immediately turns forward to be obscured by the ramus of the jaw. It supplies blood to the ear, teeth, muscles, nasopharynx, eye, and adjoining structures.

The middle meningeal artery is given off early in its course. The bleeding encountered during intracranial operation which is due to injury of the middle meningeal artery can, as a last resort, be controlled by ligating the external carotid artery.

An important branch for the nose and throat surgeon to remember is the sphenopalatine or nasopalatine artery. This branch enters the nose through the sphenopalatine foramen and may be injured during operations on the sphenoid sinus. Again, ligation of the external carotid artery will control an otherwise uncontrollable hemorrhage. Branches from the nasopalatine artery supply the nasal mucous membrane, and the trunk proceeds across the inferior surface of the body of the sphenoid. When the surgeon contemplates removal of the floor of the sphenoid sinus, the nasopalatine artery should be ligated as a precautionary measure.

The internal carotid artery is easily identified because it gives rise to no major arterial branches in the neck. The caroticotympanic

branch is given off in the carotid canal to supply blood for the middle ear. The injury of this branch by a myringotomy may cause profuse hemorrhage which is difficult to control. The destruction of this artery leaves an aperture in the wall of the middle ear which permits pus to gain access to the pericarotid region. This pathway to the cells of the petrous pyramid, cavernous sinus area and even the cranial fossa without the necessity of mastoid cell infection is well worth remembering.

A major branch of the internal carotid artery is the ophthalmic artery. It is of especial interest to the otolaryngologist because it gives rise to the anterior and posterior ethmoidal arteries. The posterior ethmoidal artery makes its exit from the orbit through the posterior orbital foramen. It supplies blood to the posterior superior part of the nasal cavity. The ethmoidal artery passes through the anterior ethmoidal foramen upon the lamina cribrosa and re-enters the nose through the lamina cribrosa to supply the anterior part of the nasal cavity.

The anterior ethmoidal artery serves as a useful surgical landmark. According to the personal statement of Dr. Robert E. Buckley, the anterior ethmoidal artery indicates the level of the lamina cribrosa. It is safe to do surgical procedures on the ethmoid cells below this level, but one must proceed with extreme caution above the artery. The safe way is to ligate the artery as soon as it is identified. At least a ligature might be so placed that the vessel would be under control. When the anterior ethmoidal artery is cut it is apt to retract within the orbital capsule, causing a hematoma or bleeding which is difficult to control. The flow of blood in this vessel is from the orbit into the nose. Ligating the internal carotid artery is the court of last resort.

The thyroid axis or thyrocervical is another main artery supplying blood to the pharynx, esophagus, and trachea. It gives off the inferior laryngeal artery. The thyroid axis being a branch of the subclavian artery makes the common carotid and the subclavian arteries the two major sanguiniferous ducts.

These few short paragraphs are broad maps that have served me well as a mental assurance in disturbing situations. Perhaps no physician in otolaryngology could say that he had never been disturbed by hemorrhage. Surgery of the head is especially susceptible to the complication of hemorrhage. Therefore, it behooves all of us to acquaint ourselves

HEMORRHAGE IN OTOLARYNGOLOGY

Methods of Control

MARVIN F. JONES, M D, New York City

HEMORRHAGE is the one outstanding occurrence in otolaryngology which practitioners in this specialty must learn to treat with a confidence that is the product of thorough knowledge. Spontaneous hemorrhage, a hemorrhage that occurs during operation, or a hemorrhage that occurs as a post-operative complication may be most disturbing or even end in the death of the patient. The best advice for any physician who must control hemorrhage is to remain calm. At the same time this advice is most difficult to follow. The best insurance of an unperturbed procedure is a complete knowledge of, and familiarity with, anatomy. The theme of this paper is an effort to show the reader how situations dealing with vascular accidents may be under the control of a physician who has an anatomic perspective.

Blood Supply of the Head

The main and practically the only arterial channels are the carotid and the vertebral arteries. The right common carotid artery is the mesial division of the right innominate artery. The peripheral division is the subclavian artery. The right innominate artery arises from the arch of the aorta. The left common carotid artery arises directly from the arch of the aorta between the left subclavian artery and the innominate artery.

The vertebral arteries are branches of the subclavian arteries and are of particular interest to the otologist. After they have joined to form the basilar artery, the two internal auditory arteries are formed from the common trunk. The internal auditory artery furnishes the only arterial blood supply for the inner ear. The fact that the same basilar artery that gives rise to the internal auditory arteries also furnishes the major portion of blood vessels supplying the vestibular nuclei is most significant.

This condensed survey leaves the thyroid axis artery (thyrocervical), also arising from the subclavian, as the sole remaining arterial channel for supplying the head and neck structures.

It seems necessary to carry the description of arterial channels a little further. The common carotid artery divides on both sides of the neck to form the internal and external carotid arteries.

The internal carotid artery proceeds directly into the cranial cavity. It gives off only a few small branches. The position of the internal carotid artery is lateral to the external carotid artery. In its course the internal carotid immediately proceeds to a deeper level in the neck. The external carotid artery lies mesial to the internal carotid artery, and this commonly used nomenclature may confuse identification. The external carotid artery does not depend alone upon its position for identification since it is easily recognized by the sizable arteries that arise from its trunk near the bifurcation of the common carotid artery.

The division of the common carotid artery into the internal and external carotid arteries occurs near the superior cornu of the thyroid cartilage. When the patient's head is turned away from the surgeon and then extended, the bifurcation of the common carotid artery lies behind and a little below the angle of the jaw.

The external carotid artery also has a bifurcation. The two trunks are the superficial temporal artery and the internal maxillary artery. Arising from the external carotid between the two bifurcations, i.e., that of the common carotid and of the external carotid, are several arterial branches. They are the superior thyroid, lingual, external maxillary, sternocleidomastoid, occipital, posterior auricular, and ascending pharyngeal arteries. The first two, i.e., the superior thyroid and lingual arteries, are easily located and ligated through the same surgical approach used for locating the bifurcation. While the third artery, the external maxillary, can be ligated, it is a little more difficult since it is higher and more deeply placed than the lingual and superior thyroid. The sole function of the sternocleidomastoid branch seems to be a blood supply to the muscle of the same name. It is relatively unimportant.

The occipital artery supplies blood to the muscles and other structures in and around the ear. The posterior auricular artery joins the occipital artery in supplying blood to the ear.

Presented as a part of the Fifth Annual Postgraduate Course of the Oregon Academy of Otolaryngology and Ophthalmology and the University of Oregon Medical School, Portland, Oregon, April 1 to 6, 1940.

Read before the Section on Otolaryngology of the Iowa State Medical Society, Des Moines, Iowa, May 3, 1940.

result in a thoroughly angry patient, antagonistic parents, and a complete loss of emotional control on my part. Under anesthesia, the hemostasis is accomplished painlessly and in an expeditious manner.

BLOOD SUPPLY OF THE TONGUE

Ascending palatine tonsillar	External maxillary	External carotid
Palatine	Ascending pharyngeal	
Descending palatine	Internal maxillary	
Dorsalis linguae	Lingual	

Adenoid Hemorrhage

These hemorrhages can be serious. Fortunately they occur more often as the result of tissue tags left hanging at the time of operation. These tags or remnants of tissue seem to act as wicks that cause a slow, unnoticed, prolonged loss of blood. Recurrent swallowing either before or after the patient's recovery from the anesthetic should be an important warning sign. The bleeding is easily controlled in most instances by briskly rubbing the nasopharynx with a gauze-covered finger. The Yanbauer direct vision speculum may be used to locate and tie any blood vessel that continues to bleed. The need to use tampons of any sort is rare. Attacks of acute otitis media following the use of such tampons have caused me to stop using them. I avoid the use of postnasal plugs, except in rare instances, for the same reason.

The area in which the adenoids are located represents a danger area for hemorrhage. Benign and malignant tumors, congenital cysts, or abscesses that have escaped observation may be discovered only because of a prolonged hemorrhage following adenoidectomy. This bleeding can be most difficult to control. The blood supply is from many sources and abundant. The naturally abundant blood supply may be augmented by additional vessels attendant on new growth or prolonged inflammatory processes. In using an electric nasopharyngoscope to view the posterior nasopharynx, numerous tortuous, dilated, superficial blood vessels will frequently be seen. The blood vessels that supply the area

include the external and internal maxillary branches of the external carotid artery and the pharyngeal branch of the subclavian artery, the two main arterial trunks furnishing the blood supply of the head. They are indeed a formidable array and hold a good reason for occasionally resorting to radiation therapy in preference to surgery when the decision rests in timid hands.

Dr John F. Erdman used a procedure and an expression in relation to malignant growths in the head which have common-sense appeal. The procedure deprived the growth of its blood supply or, as he expressed it, "starved" the growth. This starving process has three good features. One is the advantage gained when an operation becomes necessary. Second, radiation is more effective. Third, there is a practical elimination of any danger from a possibly fatal, spontaneous hemorrhage.

Because of the varied locations through which the arteries pass and the difference in their main source of supply, this starving process would be of less value in the nasopharynx than in other locations for malignancies of the head.

Hemorrhage from the Septum

The common "nose bleed" usually arises from the Hesselbach's area of the nasal septum. The point of bleeding is easily located and cauterized. Chemical or electrical cautery is effective. In elderly people it is always necessary to determine the blood pressure and the condition of the arteries. Chemical examination of the blood is advisable. Nasal hemorrhage in the aged may be difficult to control. Recurrences are frequent and portend trouble in other locations besides the nose. Nasal hemorrhages are a frequent accompanying feature of adolescence and the menstrual period in the woman. Local hemostasis must be followed by a correction of glandular maladjustment.

Traumatism of the nose causes septal bleeding, and, although this type is accompanied by an unbalanced emotional situation, the bleeding stops spontaneously. Nasal packs should be avoided, but they are sometimes

with all methods that may be used in the control of hemorrhage

The Tonsillar Fossa

The most common operation in otolaryngology is a tonsillectomy. The most common source of hemorrhage in otolaryngology is the tonsillar fossa. Under many circumstances hemorrhage from the tonsillar fossa represents a most difficult area in hemorrhage control.

Perhaps an illustration will help to accentuate the difficulty encountered in control of tonsil bleeding. A patient upon whom a tonsillectomy had previously been performed started bleeding from the tonsillar fossa. A special tendency toward bleeding had been claimed. Laboratory tests including a blood Wassermann test, bleeding time, coagulation time, and an examination of the blood platelets were reported as being normal. The operation was skillfully performed, and a complete removal of the tonsil had been accomplished. All the bleeding areas were ligated at the time of the operation. Some hours after the operation a secondary diffuse hemorrhage began. Repeated trips back to the operating room finally resulted in the control of the bleeding. All known methods had been tried without success. The patient was so exsanguinated that repeated transfusions were necessary. Medications were given without noticeable effect. Practically all hope for the patient's recovery had been abandoned when the bleeding ceased.

A peritonsillar abscess, when incised, may cause profuse bleeding both at the time of incision and as a postoperative complication. Packing with iodoform gauze is effective in most instances. When bleeding persists, the internal carotid artery or the ascending pharyngeal artery may have to be ligated. Do not make the mistake of waiting too long. A sloughing vessel can cause death quickly.

The methods used to control bleeding from the fossa following the surgical removal of a tonsil are varied. They are selected according to the experience of the individual surgeon. I have tried many methods and many medications designed to stop bleeding. A few simple facts remain. The most important fact is that "bleeding will not stop until enough time has passed following infliction of a surgical wound to allow the normal clotting functions of the blood to act." A gauze tampon, held in the fossa by means of a little pressure, controls bleeding until the normal coagulation process becomes effective. Changing the

tampon when it becomes soiled seems to help. Except when profuse pulsating hemorrhage occurs, I do not attempt to stop bleeding by other means than tamponage. If the bleeding continues after the waiting period (ten minutes) has elapsed, I grasp the bleeding vessel with a hemostat. A slip noose is made from a number 1 or number 0 catgut and a hemostat fastened on the nonsliding strand. This second hemostat guides the loop over the end of the first hemostat. When the free strand is pulled tight, both artery clamps are removed. The loose ends of catgut are cut at a little distance from the knot. A time-saving procedure is to leave the folded gauze in the first tonsillar fossa while the second tonsil is being removed. The first operative field is commonly dry by the time the operation on the second is completed.

The foregoing remarks apply to patients under general anesthesia. Local operations on the tonsils are seldom followed by any hemorrhage except from major blood vessels. These should be ligated at once.

Occasionally, an all-inclusive suture must be placed in the fossa "purse-string fashion" to control the bleeding. Another fact is that "the more manipulation, bruising, and laceration of tissue during the operation, the greater the postoperative discomfort, the longer the convalescence, and the more extensive the slough." Finally, "Never allow the patient to leave the operating room until both fossa are absolutely dry." Many a night's rest will be preserved by observing this dictum.

The thought of postoperative tonsil hemorrhage is a disquieting factor for ten days following tonsillectomy. We may consider any persistent bleeding after a patient has returned to his room as postoperative. If bleeding occurs after a tonsillectomy under local anesthesia, it usually starts about two to four hours after operation. An unusually effective method of controlling this bleeding is by injecting novocain and epinephrine solution in the area of the bleeding. If the bleeding is not controlled, at least the subsequent ligation or manipulation is rendered painless. The same procedure may be used in cases of hemorrhage following tonsillectomy under general anesthesia. Posttonsillectomy hemorrhage, especially in minors, is best handled in the operating room. A trial effort may be made to control bleeding, but if any difficulty is encountered return the patient to the operating room and tie off the offending vessel. I have tried many methods in order to avoid giving the second anesthetic. They usually

Two types of operation are performed on diseased ethmoid cells. One approach is intranasal and the other is external. The intranasal operation has the disadvantage of poor visualization with which to locate bleeding points. One must resort to frequent rest periods attendant on packs, moistened in hemostatic solutions, which diminish the obscuring blood. The surgeon seldom is forced to ligate major vessels, although logically it would seem to be a frequent necessity. The important arteries encountered in ethmoid surgery, i.e., the anterior and posterior ethmoid arteries, seem to escape injury when the surgeon knows his anatomic relations. Anomalies do occur, and their damage in this instance is excusable. If a surgeon finds he has injured the anterior ethmoidal artery, he should realize he is working in dangerous territory. This artery marks the level of the cribriform plate of the ethmoid.

External operations on the ethmoid sinus have the advantage of much better visualization. The anterior ethmoidal artery especially is easy of access and readily ligated. It is policy to preserve this artery as a landmark. Fortunately, intranasal operations are losing some of their popularity. More surgeons are favoring the external procedure. One important reason for this change is the improved cosmetic results obtained by skillful surgeons.

After the operation is finished, all bleeding is controlled before the patient leaves for his room. Packing is used only if absolutely necessary to control bleeding. If packing is used, it is removed as soon as possible. Some surgeons believe that packing increases the chances of complications.

Frontal Sinus Hemorrhage

This is a rare occurrence. Intranasal operations on the frontal sinus are not popular. This is largely because the end results have been less than satisfactory. The danger of operative or postoperative hemorrhage has, therefore, diminished. In the external operation the entire field is easily seen, and any bleeding area may be controlled. Since most surgeons who perform operations on the frontal sinuses include the ethmoids as part of their technic, the common blood supply will be stated.

BLOOD SUPPLY OF THE FRONTAL AND ETHMOID SINUSES

Sphenopalatine	Internal maxillary	External carotid	Common carotid
Anterior ethmoidal	Ophthalmic	Internal carotid	
Posterior ethmoidal			

General Nasal Hemorrhage

Blood dyscrasias may be the cause of nasal bleeding. A thorough examination of the blood is the diagnostic measure employed, and at the same time it indicates the proper treatment. Only one note will be mentioned regarding blood examinations. I have discontinued the routine tests for coagulation and bleeding time. If the patient or parent requests these tests, they are done for self-protection. Occasionally, a previous history of uncontrolled bleeding warrants the tests being done. My reason for this decision is purely the result of an impression. If my impression is correct, there is no relation between the patients who bleed and the ordinary tests used to predetermine their bleeding capacity. The one exception is that rare patient, a true hemophiliac. Tags or remnants of tissue, untied blood vessels or those whose ligatures have slipped, sloughing of tissue or overexertion most frequently cause bleeding.

Aural Hemorrhage

Bleeding from the ear may be spontaneous, may be the result of injuries to the head, or may be caused by operations. The proximity of the carotid artery anterior and the jugular vein posterior and inferior offers a real opportunity for critical consequences following surgery in this location. Dehiscences occur in the bony partitions separating the major vessels from the middle-ear cavity. These dehiscences may be caused by many types of bony defect. The openings for nerves, blood vessels, and cells are normal examples. A simple myringotomy may injure a blood vessel, and this will demand a major emergency procedure. It is most fortunate that tamponage will control most bleeding from this area. One word of caution: the ear should not be touched when the history of head injury leads the examiner to believe there is a fracture of the base of the skull. Secondary infection with a subsequent meningitis is a real danger.

The sigmoid sinus and its emissary vein are the only blood vessels that are apt to cause disturbing hemorrhage during mastoid surgery. Postoperative bleeding may also be due to a sloughing of the vessel walls. The worst part of an accidental injury to the vein wall during operation is the momentary shock for the surgeon. The quick rush of blood which follows an injury to the vein is quite alarming. Pressure effects complete control. Even the finger placed lightly on the vein will control bleeding if the opening in the vein wall is small. Muscle tissue, flat-folded iodoform

necessary to control prolonged nasal bleeding due to traumatism. Simple prolonged pressure is effective in most "nose bleeds." Septal bleeding may be severe, recurrent, and depleting. A submucous resection of the nasal septum, strangely enough, will prove effective in these cases. It is understood that the operative technic includes the removal of the incisor crest of the palatine process of the superior maxillary bone. This crest houses the incisive canals and the terminal branch of the nasopalatine artery. Also, during operation it may be necessary to deal with bleeding from this area. Two methods of control are effective. One is to place a blunt instrument over the bony opening and give the instrument a sharp tap with a hammer. Second, squeeze the crest with a Lutz forceps. Do not apply enough pressure to bite through the bone. The usual type of bone wax may be used, but it is difficult to manipulate.

Hemorrhage during operation may be annoying but it seldom reaches alarming proportions. Lacerated "flaps" probably cause most of the bleeding. Postoperative hemorrhage may be troublesome. Packing is the most efficient control. If a hematoma has formed between the flaps, it must be evacuated before either a good result or the cessation of bleeding can be expected. Many surgeons incise one flap along the floor in order to obtain proper drainage for any blood that might collect. This incision must be far enough anterior to miss the posterior septal branch of the sphenopalatine artery. Hematomas and septal abscesses are prevented by a drainage incision. The lacerated condition of the "flaps" following some submucous resections make further drainage superfluous.

Vaseline gauze still remains the dressing of choice to prevent postoperative bleeding. Many ingenious devices have been tried to obviate the use of gauze, but they have proved less desirable for me. Also, I have had more complications when no effort was made to hold the "flaps" in apposition.

BLOOD SUPPLY OF THE SEPTUM

Superior labial	External maxillary	External carotid	Common carotid
Sphenopalatine	Internal maxillary		
Posterior ethmoidal	Ophthalmic	Internal carotid	
Anterior ethmoidal			

crosses the nasopharynx in the mucous membrane covering the roof of the nasopharynx which forms the floor of the sphenoid sinus.

The internal carotid artery may be partially or completely exposed in its course past the sphenoid cavity. The bony canal of the internal carotid artery may encroach on the space of the normal sphenoid. Any major injury to the internal carotid artery can result in death from hemorrhage before control can be established. A sphenoid sinus filled with bleeding granulation tissue, in addition to an injured sphenopalatine or carotid artery, is a situation to cause a tremor in the legs of the most intrepid surgeon. A ligature around the common carotid artery is the only hope.

The Maxillary Sinus Hemorrhage

This type of hemorrhage may be the most difficult to discover and requires radical measures to control. Spontaneous bleeding may occur from granulation tissue or malignancy. Such a simple operative procedure as a "window opening" or antrotomy may cause injury to the palatine artery. The course of this artery varies, reaching a point so far forward that the usual removal of bony antral wall would include the artery. Packing with pressure, mutilation of the bony canal, pinching the bone with a strong forceps and local application of epinephrine may all be tried but sometimes without results.

Operations performed on the antrum are frequently accompanied by a profuse general bleeding. When the pathologic contents of the antrum have been removed, this bleeding stops. A Caldwell-Luc operation is the only procedure that will stop the spontaneous hemorrhage caused by granulation tissue in the antrum. There should always be a close scrutiny for malignancy of any patient who is subject to recurrent unlocalizable nasal hemorrhage.

BLOOD SUPPLY OF THE MAXILLARY SINUS

Posterior superior alveolar	Internal maxillary } External carotid
Infraorbital	
Sphenopalatine	

Hemorrhage from Ethmoid Sinuses

Spontaneous hemorrhages from the ethmoidal cells occur also from necrosing granulation tissue and malignancies. This statement does not eliminate the possibility of syphilis as a cause, but it is uncommon. Again, packing is the court of first resort with ligation the last.

Sphenoid Hemorrhage

The sphenoid sinus is rightly considered as being in a field potentially dangerous because of hemorrhage. The sphenopalatine artery

posure of the major blood vessels is less difficult. Fatal postoperative hemorrhage following laryngectomy may also be explained on the basis of this same inaccessible and diversified blood supply. Modern technic used

in laryngectomy makes these operations practically bloodless. Postoperative hemorrhage, however, occurs too frequently as a complication.

121 East 60th Street

I'M ALLERGIC

Some years ago I went to see

A doctor where I live

About some blotches on my skin

Says he, "You're sensitive"

Still later when my breath got short

Says Doctor B "You must

Completely segregate yourself

From any sort of dust"

My nose then gave secretions which

Was far beyond my needs,

"It's pollen does it," I was told.

"Allergic to some weeds"

My headache too, it seems, was due

To paint containing lead,

Just being sensitive to it

Made hives inside my head

So now I shy this way and that

Afraid to breathe or eat,

Since pains in joints and tummy too

Come from my love for meat

I wander up and down the world

In search of something new,

It seems I'm sensitive to starch

And fats and proteins too

I've lived for years on liquid food

But now I'm through I fear—

Today they say I'm sensitive

To whiskey, gun, and beer

—*Bulletin, Academy of Medicine of Cleveland*

WEEDING THEM OUT

"More than 5,000 cases of syphilis have already been found among Selective Service candidates," Assistant Surgeon General R. A. Vonderlehr of the United States Public Health Service said at a Regional Conference on Social Hygiene and National Defense in St. Louis. He presented the findings of a preliminary tabulation of 120,000 blood tests and physical examinations for syphilis performed on Selective Service candidates in twenty-three states during November and December, 1940.

Rates among the states range from 7 to 114 per 1,000 men examined, Dr. Vonderlehr reported. He divided the twenty-three states into four groups according to the extent of the syphilis problem they presented.

"It will be noticed," the Assistant Surgeon General pointed out, "that the two groups with the highest average rates are composed of southern states. Comparison shows that they also were among those states which had the highest syphilis rates for men drafted in the last World War." New York State is in group II, with an average rate of 19 per 1,000.

THE "YOUNG" PHYSICIANS

The young practitioner may be surprised to find that the alert and progressive physician in his community is not necessarily his classmate nor one who has been in practice four or five years. He may be the professor under whom he studied at medical school or the white-haired doctor around the corner, observes the editor of *Medical Annals of the District of Columbia*.

Mental youthfulness has little to do with years. It is a quality that some men have and others do not. A young man can be as intolerant, selfish, and conservative as a sixty-year-old. On the other hand, the mature individual may find each day a new adventure, giving zest and significance to life.

BRITISH "CURE" FOR NAZIS

British physicians are giving captured Nazis a dose of their own medicine, according to the English magazine *Aeroplane*. The "cure" originated, the periodical states, when an especially arrogant German pilot was brought into a base hospital. Although badly shot, he persisted in telling the staff what he thought of English medical science.

The doctors said nothing. They stitched and dressed his wounds, gave him a blood transfusion. Then, when he was comfortably settled in bed, they told him: "Now, my lad, you have two pints of good Jewish blood in you. We hope it will improve your manners." This time it was his turn to be silent.

gauze, or a Vaseline-covered, cotton "blowout patch" have all proved effective in controlling the hemorrhage from the smaller injuries. If necessary, the vein may be completely blocked off by an adequate pressure. Bleeding from the emissary vein is easily stopped by the bone wax.

Minor bleeding, which is annoying but not dangerous, may occur during operation. An artery in the floor of the middle fossa in the epitympanic or epiantral region may be troublesome. Removing the dural plate with the enclosed artery is effective in stopping the bleeding. Granulation tissue in the mastoid and middle ear may bleed rather profusely, but the bleeding ceases after the pathological tissue is removed.

Postoperative bleeding from granulations may be serious. On two occasions I have had to control serious postoperative bleeding from the mastoid wound when granulation tissue was the cause. On both of these occasions the bleeding was sufficiently profuse to demand transfusions. The bleeding was stopped by reopening the mastoid wound and wiping out the granulations. No bleeding vessel was tied or seen in either case. The bleeding ceased immediately and did not recur in either instance.

This type of hemorrhage must not be confused with the rapid and most dangerous bleeding that ensues after sloughing of the sigmoid sinus wall. Immediate, complete opening of the mastoid wound plus local pressure until the sinus can be obstructed at both ends is apt to prove a real lifesaving measure. Ligation of the jugular vein is not indicated because it will increase venous pressure.

Unless the patient is extremely exsanguinated, no transfusion should be given until the

surgeon is reasonably sure that the vascular channels will stand the increased pressure. Small transfusions should be given as soon as it is reasonably safe.

I have seen 2 cases of venous aneurysm in and around the ear. They are uncommon but offer a real danger to the patient. Many methods of curing these aneurysms have been tried without conspicuous success. Their tendency to recur circumvents surgery and radiation is not entirely satisfactory.

Laryngeal Hemorrhage

Hemoptysis has been almost synonymous with pulmonary tuberculosis. Since direct endoscopy has reached its present perfection, a thorough examination of the respiratory tract is possible. Now, any bleeding point accessible to the newer methods can be located exactly and treated. Bleeding frequently occurs from ruptured blood vessels, ulcerations, and growths in the larynx. Except for the major bleeding, these areas can be directly treated by cautery or coagulation. Aspirations on the structure of the larynx are no longer the formidable procedures they were before direct suction could be applied to keep the field clear of blood.

Spontaneous hemorrhages in the larynx have caused death through drowning or asphyxiation. Unfortunately, the blood supply of the larynx is from widely separated sources, and quick location of the responsible artery is difficult. Fortunately, the same incision used for a tracheotomy may be so revised that ex-

results of Murray⁵ and those from England^{3,4,6} The predominating organisms found in the throats of the nondiphtheritic cases included *Str. hemolyticus*, *Str. viridans*, *Staph. albus*, *Staph. aureus*, and Vincent's organisms. Staphylococci were isolated more often than in the diphtheritic group. There was no correlation between the bacteria found and the result of the tellurite test.

Comment and Summary

Reports from widely separated localities fail to confirm the accuracy of the tellurite test. Our results show a false negative error of 23 per cent in bacteriologically proved cases of diphtheria and a false positive error of 50 per cent in nondiphtheritic cases. Numerous organisms, including staphylococci and streptococci, reduce tellurite salts in culture mediums producing black or gray colonies. The presence of these bacteria in the throat probably interfere with the tellurite test as an aid in the diagnosis of diphtheria. It has been suggested that the type of *C. diphtheriae* found in different localities might account for some of the false results with the tellurite test. We did not subtype our cultures, but from the reports of the authors cited above^{3,4,6} it seems that the results do not depend upon the type of organism present. Murray⁵ pointed out that the incidence of the gravis strain varied between 10 and 93 per cent in the different series of diphtheria cases reported. Murray agreed with Tomlin that the type of *C. diphtheriae*

had no effect on the results of the tellurite test.

We concur with Tombleson and Campbell³ who state that "in view of these serious objections, reliance cannot be placed on the immediate tellurite test in confirming or excluding a clinical diagnosis of diphtheria and it cannot replace bacteriologic methods at present in use."

We wish to thank Dr. R. S. Muckenfuss, director of the Bureau of Laboratories of the New York City Department of Health, for his helpful cooperation. Miss Alice Mann of the Bureau of Laboratories prepared the tellurite solution and did much of our bacteriology.

IT'S A SMART COUNTRY, FOLKS

An Englishman was visiting Milwaukee, reports the *Milwaukee Medical Times*, and while driving along the highway, saw a large sign, "Drive slow. This means you!"

The Englishman stopped in surprise and exclaimed, "My word! How did they know I was here?"

THE BATHTUB PERIL

"Safe as at home" is an old saying, but more accidents happen in the home than in a factory. According to statistics quoted in the *Medical Record*, the home bathtub is a thousand times more dangerous than a railway train and 200 times more dangerous than a fight in a passenger plane.

THE TELLURITE TEST FOR THE DIAGNOSIS OF DIPHTHERIA

MORRIS S. STERN, M.D., San Fernando, California, and M. BERNARD BRAHDY, M.D., Mount Vernon, New York

IN 1938 Manzullo of the Bacteriologic Institute of the National Department of Hygiene at Buenos Aires reported a method for the diagnosis of pharyngeal diphtheria which required only ten minutes.¹ He observed that pieces of diphtheritic membrane that were incubated in a blood-tellurite medium turned black. Subsequently, he applied a 2 per cent solution of potassium tellurite directly to the diphtheritic membrane *in situ* and found that in almost all cases it turned black or gray in ten minutes. When the tellurite solution was applied to nondiphtheritic membranes no change in color occurred.

These important observations were confirmed in this country by Fox, Rhoades, and Lack.² However, several reports from England and Africa^{3,4,5} failed to substantiate Manzullo's contribution. They found that from 16 to 21 per cent of the diphtheria cases failed to give a positive test. On the other hand, the same authors, as well as Tomlin,⁶ found that from 36 to 55 per cent of their cases with nondiphtheritic membranes gave a positive test.

In a letter to the *British Medical Journal* Tynan,⁷ of Dublin, commented on his results in 75 cases. He obtained 13 per cent false negative tellurite tests in 54 cases of diphtheria and 52 per cent false positive tests in 21 control cases. Woodcock, of Leeds, England, studied 200 cases with a membrane or exudate and also reported his results in a letter to the same journal.⁸ He stated that one must conclude that the tellurite test is of no real help to the clinician.

Procedure

We tried the tellurite test at the Willard Parker Hospital during 1938 and 1939. The technic outlined by Manzullo was carefully followed. A fresh 2 per cent solution of potassium tellurite was prepared every thirty days. A cotton swab dipped in the solution was applied to the membrane, care being taken not to touch the tongue. No patient who had used a gargle or local application of peroxide,

tannic acid, or methylene blue was included in the series. The membrane was observed for change in color ten minutes and again thirty minutes after application of the tellurite solution.

Each case received careful bacteriologic investigation before and after the tellurite test was performed. Löffler cultures were sent to each of three laboratories, and virulence tests by the guinea-pig method were made in nearly all cases from which *Corynebacterium diphtheriae* was recovered. In addition, a report was made of the other organisms present in the culture. The results are tabulated in Tables 1 and 2.

Material and Results

Only patients who had an easily visualized membrane and who had not used a gargle or local application before admission were subjected to the tellurite test. All cases tabulated as diphtheritic had one or more cultures showing *C. diphtheriae*, and most of them had a positive virulence test. Cases tabulated as nondiphtheritic controls had a tonsillar membrane from which all cultures (repeated on successive days) were negative for *C. diphtheriae*. The percentage of bacteriologically missed cases of diphtheria was reduced to a minimum by taking repeated cultures. These strict criteria reduced considerably the number of cases used for statistical evaluation.

There were 30 cases of diphtheria in 7 of which the tellurite test was negative, giving a false negative error of 23 per cent. This agrees with the error found in the larger series (Table 3) reported by Tomblinson and Campbell (17 per cent), Cooper and his co-workers (23 per cent), and Murray (21 per cent). Other organisms isolated from the throat cultures in addition to *C. diphtheriae* were *Streptococcus viridans*, *Str. hemolyticus*, *Staphylococcus albus*. There was no correlation between the presence of these organisms and the result of the tellurite test.

Our nondiphtheritic control group included 17 cases of tonsillitis, 2 cases of infectious mononucleosis, and 1 of Vincent's angina. In these 20 cases, from which *C. diphtheriae* could not be isolated, the tellurite test was positive in 10, giving a false positive error of 50 per cent (Table 2). This agrees with the

Senior resident physician (formerly) and attending physician, respectively, Willard Parker Hospital.

chemical reducing agents The action of such reducing agents on the skin varies with the status of the epidermis—whether intact or ruptured Furthermore, with intact epidermis, the action varies with the concentration Briefly, on the intact epidermis, concentration of less than 6 per cent acts as a keratoplastic, higher than 6 per cent, reducing agents act as keratolytics, but they first increase the thickness of the corneum which ultimately lifts off by reason of granular layer cell irritation Discoloration and sensation of itching (pain in keratolytic concentration) accompany these activities The action on the exposed cutis does not depend upon the concentration but upon the anatomic structure, and there is an accompanying reaction due to induced inflammatory changes Parasites are destroyed both by the chemical action of removing needed oxygen and by the lifting of the epidermis and physical removal of implanted ova, etc.

Salicylic acid is an ingredient in so-called Whitfield Ointment The ointment has been included in the official compendium under this name. Few physicians who order it know that it was never offered by Whitfield for the treatment and cure of ringworm. Whitfield described the salicylic acid-benzoic acid combination in soft paraffin and coconut oil (the original formula) as a preliminary application to the thickened horny layer of tinea-infested skin. Whitfield applied chrysarobin in ether, chloroform, and acetone as the actual fungicide.

Phenol

The next series of prescriptions to consider includes phenol. Few prescribers made any distinction between crystal phenol and liquefied phenol.

The phenol crystals are not soluble in the calamine and zinc lotion, for example They float on top near the neck of the bottle and, despite directions for shaking, they reach the skin in the crystal form The experienced pharmacist disregards the prescriber's order and includes liquefied phenol A mixture of liquefied phenol and an equal amount of glycerin is miscible with water There is one part of distilled water to each nine parts of the melted phenol.

There is reason to believe that the mixture of a mercury compound and phenol is a bad one from the pharmacologic standpoint as well as from the effective or realistic one on the skin In theory, the phenol reduces the mercury salt to the metallic mercury In

clinical application, the mixture has led to the appearance of pigmentation

Menthol

The problems offered by phenol mixtures apply to those with the other most popular alcohol—namely, menthol

Mixtures of menthol and phenol are very popular The two ingredients are found in combinations listed for each in the two series immediately preceding Phenol and menthol form a liquid when triturated together The liquid is soluble in not less than 40 per cent alcohol If improperly or incompletely dissolved, combinations of menthol with its incompatibilities may be very irritating to the skin Since they are offered for their anesthetic effect on the specific nerve endings for pain, additional irritation is unsought. The sensation of coolness on application of menthol is due to the stimulating effect on the nerve endings for cold

Calamine

Brief comment is given on some other prescriptions We begin with calamine and zinc lotion

Calamine and zinc lotion is listed in the *National Formulary* Physicians ordinarily consider that there is some special virtue in prepared calamine Few know when writing for calamine and zinc oxide in this formula that they are repeating the zinc oxide because prepared calamine is zinc oxide tinted with ferric oxide. Once the books described calamine as calcined zinc carbonate, which meant in reality zinc oxide, for the calcine process drove off the carbonate in the form of gaseous carbon dioxide Some physicians (and not a few dermatologists) seek to disguise the pinkish color of prepared calamine They order the lotion with the addition of sulfonated bitumen First, they make the zinc oxide pink by ordering prepared calamine, and then the pink is changed to brown Another factor must be recalled few patients appear for care of the skin who have not already attempted to obtain relief by applications of the "pink lotion"

Sulfur

The next ingredient we consider in slightly more detail is sulfur Unless the doctor orders specifically, the pharmacist has the choice of (1) sulfur that has been washed free of ammonia water until it no longer imparts a blue color to red litmus paper (sulfur lotum or washed sulfur), (2) sulfur that added to water

THE PRESCRIPTION FOR THE SKIN

HERMAN GOODMAN, M D, New York City

SINCE 1898, in New York State, the examination for medical practice has not included tests on pharmacy or prescription writing. The medical colleges have, therefore, not stressed this important phase of medicine. An entire generation of physicians has not been trained to write any prescription in the old-fashioned sense. Then there is a steady increase in physical methods in treatment of skin ailments—the ultraviolet emanators, the x-ray, short wave, grenz ray, and whatnot have displaced the written prescription on the pharmacy. Third, the improvement in cosmetics and the encroachment of the field of medicine we call dermatology instead of dermatopathology by the beauticians, barbers, and purveyors of mis-called cosmetics has made the physician dermatologist conscious of his shortcomings in prescription preparations. He hesitates to compete with the finished product of the manufacturer which lies on the counter of the pharmacy. Fourth, the large-scale pharmacy agency impresses him with the value of its products which have trade names easy to remember, and still easier to write. Fifth, we list a growing tendency for dispensing under one or another guise, as coded prescriptions, products with pharmacy labels delivered at the specialist's office to the patient, one-pharmacy prescriptions, etc.

We have neither the time nor the inclination to offer remedies for the above conditions which are economic and beyond our immediate control. We do offer an analysis of 119 prescriptions for skin patients in drugstore files during the fall of 1939. They were not selected but taken in order. The physicians were general practitioners and skin specialists.

Five prescriptions were for internal administration: mixed treatment, twice, vitamins, once, and tin oxide tablets, twice.

External applications included eight powders, forty-three liquids, and sixty-three greases. The total number of ingredients was eighty-eight. They appeared thirty-five times in the powders, 156 times in the liquids, and 187 times in the grease prescriptions.

The ingredient that appeared most often was salicylic acid, found in twenty-five prescriptions. Phenol and menthol were noted

alone or together in forty-one prescriptions. Zinc oxide was ordered for twenty prescriptions. Boric acid was prescribed fourteen times, ammoniated mercury, twelve, resorcinol, eleven, and resorcinol monoacetate (euresol), eight times. Alcohol appeared in fifteen prescriptions, aquaphor, thirteen times, rose water, thirteen, lanolin, eleven, and petrolatum, eight times. Prepared calamine was ordered eleven times, usually with zinc oxide.

Prescription blanks signed by physicians called for proprietary remedies in six instances and could be regarded as reminders rather than as orders on the pharmacist.

Sulfur was named only four times in the 119 prescriptions. There were two additional orders for lotio alba, one for Vlemmick's solution, one each for proprietary solid lotio alba, and a proprietary Kummerfeld's lotion. Sodium thiosulfate was found twice.

There were thirty-five ingredients that appeared once in the analysis. The tendency is to name the entire formula instead of writing the individual ingredients and quantities with directions for compounding. Whitfield's ointment is given as an example. Many physicians left the arithmetic to the pharmacists by prescribing a number of ounces of a percentage concentration—as ammoniated mercury, 3 per cent in ointment to an ounce.

The study of the filed prescriptions gave no inkling as to the need for specialized vehicles or for the estimated quantitative need of the individual finished prescription. No adherence to the pharmaceutical divisions of epidermic, endodermic, and diadermic ointment vehicles is noted. The greases ordered apparently disregarded such divisions. The amount of similar prescriptions was not uniform. A prescription from one physician for scalp wash would call for 2 ounces, and another doctor would order $1\frac{1}{2}$ pint. The physicians did not restrict their prescriptions to available containers. Many ordered 100 parts which was too much for a 3-ounce and too little for a 4-ounce jar or bottle.

Salicylic Acid

Salicylic acid is a popular ingredient in prescriptions intended for the skin. We list nineteen. The action of salicylic acid is representative of the group that Unna described as

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 8, 1940

find cheaper and perhaps better for the purpose is not an emulsion in the chemical sense and offers a better medium for the electrolytes

A formula that does not include directions but is copied and given the patient to take to the pharmacist may sometimes bring results not anticipated by the original prescriber. A formula in the collection called for olive oil and lime water. Unless so directed some pharmacist would not take the time to form an emulsion. Modernization of this formula would result in forming a soap of the carbon tetrachloride ingredient with the synthetic emulsifiers, such as triethanolamine or mixed propionolamines.

The vehicle may be of greater importance than the ingredients that are included for their activity on the skin and its lesions. It is a theory that deserves further study that the skin should be regarded as an emulsion and that it may be either a water-in-oil or an oil-in-water emulsion. If the application ordered on prescription or bought over the counter as a

corrective or decorative cosmetic is in the same phase as the skin at the time of application, there is no damage done. But, if it should so happen—and trial and error is the only clue to date—that the application is in the opposite emulsion phase from the skin, we have further difficulties. One example alone must suffice. The patient who is ordered to stop applying soap and water is in effect ordered to stop the application of an oil-in-water emulsion. If, contrariwise, he is given a lanolin vehicle, he is told to apply what is, in effect, a water-in-oil emulsion. Patients who do not do well with soap and water are conventionally told to apply the grease. That is change of phase. Contrariwise, the patient who does not improve with our lanolin greases is directed to apply starch boiled in water which acts as an outer water phase.

Proprietary cosmetic and pharmaceutical preparations for the skin may be either one or the other phase if fat and fatlike ingredients are included in their manufacture.

NEW YORK PHYSICIANS ART CLUB

The fourteenth annual exhibition of the New York Physicians Art Club will open April 26, for one week, at 6 East 57th Street, under the auspices and for the benefit of the British War Relief Society, Medical Aid Department. This is the first time that the Physicians Art Club has given its exhibition as a benefit and it is expected that the worthy cause will be a factor in greater participation than ever by members and visitors. On the opening night there will be a reception with addresses by prominent speakers, Scottish pipers, collation, and a preview for the press and invited guests. Pictures and other exhibits marked for donation will be sold at auction on last nights of the exhibition for benefit of the British War Relief. Works previously exhibited may be submitted and the usual limitation to four has been waived.

PERCY FRIDENBERG, M.D., Secretary-Treasurer

CORPSE'S YELL HALTS STUDENT

When a medical student at the Anatomical Institute of the University of Mexico City touched the chest of a supposed dead man with the dissecting knife, the "corpse" sat up and yelled, "You fool, you are hurting me."

The student almost collapsed as his subject said that he was a farmer and that the last he remembered was drinking to celebrate a friend's birthday anniversary. He fell in the street and as he showed no life at a hospital he was taken to the morgue where he was left 72 hours. Still covered with a canvas he was taken to the Institute for dissecting. The revived "corpse" walked unsteadily to an adjoining hospital.

The student, suffering from a severe attack of nerves, had to be carried to the hospital on a stretcher.

—Canadian Doctor

CANTO

The melancholy days have come,
The dizzy, busy season,
With meetings scheduled every night
"Till we're bereft of reason."
"The perineum's bulging now,"
The nurse keeps on repeating
"I'll try to get the doctor, but
I fear he's at a meeting."
The patient writhes in agony,
But soon she'll suffer less, sir,
For Doc is learning what to do
From hearing a professor!—

Exchange, quoted in *Westchester Medical Bulletin*

BY THE LATE RETURNS

Seen by G. S. E. in the Sunbury (Pa.) Medical Society News

The famous trio of Draft Board examiners, Drs. Wilkerson, Wentzel, and Solomon, carefully inspected 28 men recently in Sunbury. The clerk reported that 12 draftees had enuresis. This seemed terribly high so they asked about it. The printed question was "Did you wet the bed since childhood?"—When asked the reason for answering "Yes," they answered, "We are Pennsylvania Dutch. We thought you said, 'Did you WENT to bed since childhood?'"

J.A.M.A.

and filtered has a filtrate neutral to acid or alkali litmus (sulfur praecipitatum or praecipitated sulfur), and (3) sulfur with sulfuric acid which reddens litmus and may be present in such quantities as to cake (sulfur sublimatum, sublimed sulfur, or flowers of sulfur)

The physicians in many instances merely wrote the short or popular name for the sulfur preparation he thought he ordered for his patient. We find *lotio alba*, *Vlemminckx's solution*, and *Kummerfeld's lotion*. The conventional white lotion (*alba lotion*) has been studied quantitatively, and according to these studies the active ingredient is released hydrogen sulfide. The directions in the *National Formulary* call for shaking the mixture of solutions of zinc sulfate and potassa sulfurata before corking. The active ingredient is released in the face of the pharmacist who prepares it freshly according to official directions. But the transfer of the final product from a store jar to a patient's bottle is attended with practically complete loss of the active ingredient.

A commercial variant of white lotion is a solid prepared by mixing 100 per cent solutions of zinc sulfate and potassa sulfurata. The precipitate catches and holds in physical union a small quantity of the liberated hydrogen sulfide gas evolved by the interaction.

Formula for *Vlemminckx's solution* is found in the *National Formulary*—*liquor calcis sulfuratae*. Neither the *United States Pharmacopoeia*, the *National Formulary*, nor the *Dispensatory* carries any formula for *Kummerfeld's lotion*. The pharmacist has his choice of no less than three formulas calling for combinations of camphor, sulfur, in tragacanth or acacia suspensions. A blank calling for *unguentum sulfur*, 40 per cent, is in the collection. It is difficult to understand what the physician wished the patient to secure. There is no ointment of this nature in the official *Dispensatory*. The pharmacist either must call the prescriber or use his own judgment. In either instance it appears to us that the order is far from good prescription writing from the standpoint of the pharmacology or dermatopathology.

A few prescriptions called for sodium thiosulfate for external application. The chemistry of sodium thiosulfate in relation to skin therapy is complex. The activity depends upon the chemical reaction of the part to which it is applied. The acidity or alkalinity of the mediums is of utmost importance. The salt requires solution for its ionization. Prescribed in a powder would defeat this, unless

the part to which it was applied was moist. The presence of other agents add to the difficulties of analysis of reaction. Furthermore, the concentration—2 per cent—is low for measurable effect. By and large, sodium thiosulfate is best prescribed alone.

The influence of a pharmaceutical house with a good product and an educational director is evident. Six of the eight in the series of prescriptions no doubt inspired call for the active product by its trade name.

Resorcinol monoacetate available under that name is considered by many not to be the exact counterpart of the euresol and certainly not the equivalent of the perfumed euresol. There is a great difference in price, and some, not overethical pharmacists have been said to substitute the nontrade-marked variety upon calls for the euresol.

Grease Vehicles

It is not impossible from the text of any prescription intended for skin application to learn or guess what vehicle should have been ordered. Examination of the prescriptions did not help. One prescriber asked for "bland base." Did he seek action on the surface of the cutaneous covering—a form of epidermic vehicle—hence, mineral fat and fatlike products? Did he seek action in the skin—a form of endodermic vehicle—hence, some form of animal fat or fatlike product? We assume that he did not seek action through the skin for which he would have required a form of diadermic vehicle. But the pharmacist has no means of knowing—the prescription should not give him a choice. Bland base might mean anything in the realm of greases. The one selected by the pharmacist might not be the one that gives the patient the result desired. The wrong choice of vehicle might make matters worse instead of better. An order for one mixture of lanolin and white petrolatum indicated that the prescriber recognized one difficulty of lanolin greases—they do not spread easily. *Aquaphor* which was ordered in thirteen prescriptions, has the ability to take up many times its weight of water.

The practicability of a prescription including rose-water ointment depends entirely upon the type the pharmacist places into the product. It is entirely possible that an official *Unguentum Aqua Rosae*, U S P—a perfect emulsion—will be quite unsuitable with electrolytes, particularly on agitation, since the emulsion will break. A rose-water ointment that is not official but that many pharmacists

throughout the year Obviously, many of the exposures are of short duration, at infrequent intervals, and involve only 1 individual On the other hand, 1 individual may be exposed to many compounds in a relatively short period of time, complicating the situation, especially with regard to determining the responsible agent in a dermatitis

In our experience, dermatitis has been numerically the most important disability Here, obviously, the problem involves not the detection of the toxic effect, the dermatitis, but the identification of the offending agent and its mode of action so that suitable preventive measures may be adopted Many of these substances that can cause dermatitis may be classified as to the type of effect, whether mechanical, desiccating, hydrolytic, lipid solvent, detergent, protein precipitant, etc An increasing and considerable number of these organic compounds act as cutaneous sensitizers or allergens Over 90 per cent of our cases of dermatitis due to organic chemicals fall in this category of sensitization dermatitis, and the compounds responsible are extremely varied as to structure and chemical activity This concept of cutaneous sensitization or allergy is an extremely important one and is a difficult subject to explain to the layman We feel that a partial understanding of the nature of sensitization by the individuals exposed is essential if their intelligent cooperation is to be had They must appreciate that the greater the contact with certain substances the more likely the sensitization and, subsequently, the dermatitis, and since the sensitizing process usually occurs without obvious pathologic signs it is necessary to have as complete limitation of contact as possible in order to minimize it

The patch test has been an invaluable aid in indicating the responsible agents in many cases of dermatitis With new compounds there is always the difficulty of determining a proper concentration of the test material which is not a primary irritant, and for this purpose the guinea pig, with a fairly comparable skin reaction to that of the human, has been a quite satisfactory test animal Caution must be observed in choosing the proper concentration, for it is possible to sensitize an individual to the test material even when no previous sensitivity existed Patch testing to determine whether or not there is a pre-existing sensitivity before exposure and to eliminate sensitive individuals is, in our experience, of little value Where the exposure is to a particular substance peculiar to a special trade

such a procedure might be justified, but where the exposure is to a number of substances, of varied allergenic potency, the variables in the problem and the relative ease with which sensitization can occur to some compounds minimize the value of pre-exposure testing We know of no method for determining the tendency of the skin of a particular individual to become sensitized Neither do we place a great deal of emphasis on the complexion type While it is agreed that in general the skin of brunettes is more resistant to primary irritants than that of blonde and red-haired persons, we have not been able to correlate any complexion characteristic with increased susceptibility to sensitization

A slightly different attack on the problem has shown promise of being useful It is based on the principle that all substances vary with respect to their tendency to cause sensitization and that these quantitative differences can be determined, at least roughly Frequently, in a manufacturing process where dermatitis has been a problem, the offending agent can be substituted The change may involve considerable expense, and the new compounds may be untried as to their effect on skin. A technic has been developed for determining the relative allergenic potencies of organic compounds, using guinea pigs as test animals The method, applied to substances with which a considerable human experience has been acquired, gave a remarkably good correlation between the incident human and guinea-pig dermatitis The results of these experimental studies, begun with the collaboration of Dr Henry Shaw of the University of Rochester Medical School, are now being used by us to aid in the choice of chemicals for certain manufacturing processes

The detection of early toxic effects other than dermatoses to an absorbed chemical compound presents many complex and varied aspects In some instances amounts of material too small to cause any functional change for long periods of time may later cause profound disturbances Because these delayed effects are unpredictable and may occasionally be serious, we have adopted the attitude that all such accidental absorptions be kept at an absolute minimum. Frequently, it is possible to demonstrate the absorbed material in excretory products, and, unless it has been clearly demonstrated that the excess is harmless, we have insisted that the exposure be materially lessened The demonstration of these absorbed materials or of products identifying them has been of considerable

A PROGRAM FOR DETECTING POSSIBLE TOXIC RESPONSES TO A VARIED ORGANIC CHEMICAL EXPOSURE

JAMES H. STERNER, M.D., Rochester, New York

THE variety and quantity of organic chemicals in industrial applications are expanding at an amazing rate. Many compounds that were laboratory curiosities a few years ago are now available and used in car-load lots. There is little evidence that our friends, the chemists, will declare a moratorium on new chemicals, and we can only hope that the rapid advance will not too far outdistance an adequate medical control of exposures.

The problem of preventing absorption and of detecting incipient functional and anatomic impairment in individuals exposed to many chemical substances presents difficulties. While there has been a constant improvement of our medical tests in the direction of greater accuracy and finer definition, we are well aware that there are relatively few means of indicating with certainty the earlier functional changes and slight anatomic injuries which are the precursors of the more serious and often irreversible pathologic states. Ideally, all exposures would be so controlled that there would be no absorption of harmful substances, but practically this is an impossible goal and fortunately not an essential one for the well-being of the individuals exposed. The human organism is equipped with a variety of mechanisms for detoxifying harmful substances, and there is a level at which these processes can function without evidence of serious disturbance to the body. Many of them are constantly handling "toxic" products of normal metabolism, and in this sense "detoxication" is a normal physiologic function—not a pathologic one. If the limits of these processes could be determined and correlated with the factors of exposure, the maximal exposure consistent with health, at least for most substances, could be defined. Both conditions present many variables that greatly complicate the problem, but with many chemical compounds information is available that makes possible and practical the safe control of exposures.

The methods of attack are necessarily varied. The most unfortunate and costly approach is through the sequence of definite

injury, first defining the levels of exposure which are harmful with the subsequent decrease of exposure to a level consistent with health. However, through these inadvertent instances much valuable information has been gained, suggesting methods for detecting earlier signs of injurious absorption. These methods include the determination of slight and reversible changes in some physiologic function, such as variations in the size and hemoglobin content of the erythrocyte or the number and type of leukocytes or the change in a detoxication mechanism such as the urine sulfate partition. In other instances the level of excretion of the absorbed substance, such as lead or mercury, may indicate impending danger. Still other warning signs may be found in small amounts of pathologic pigments, such as methemoglobin or carbon monoxyhemoglobin, and in the excretion of porphyrins or urobilinogen.

In the case of the absorption of certain substances, the sequence of events beginning with the identification of the substance in the urine in excess amount or of slight functional changes and progressing to severe and irreversible anatomic injury has been quite clearly described. The finding of these earlier signs following the absorption of other substances does not permit the unequivocal conclusion that the more severe later effects will necessarily follow, but the proving of the point may be most unfortunate. A wiser course is to accept these early signs as friendly warnings and to reduce the degree of absorption. Animal experimentation is a valuable, but not infallible, guide in indicating these relationships and merits an increasing application to the study of new chemicals.

The following instances based on an experience with a program to control exposures to a variety of organic compounds illustrate some of the problems of detecting absorption and early toxic responses. The number of organic chemicals involved is some ten to twelve thousand—including the intermediates encountered in the syntheses. The amounts vary from a few milligrams to many thousands of pounds, the number of individuals exposed to a particular compound varies from one to several hundred, the time varies from a few seconds to continuous eight hours a day.

lower leukocyte values. Counts below 5,000 are frequently found in individuals with no appreciable exposure and no evidence of pathology. Similarly, lymphocyte percentages above 35 are a common finding and, we believe, well within the normal limits. Other examples might be cited as showing the need of revising our concepts of what constitutes the range of "normal" values, or at least the values found in a cross section of the employed population.

At first the sedimentation rate appeared to be a useful test for detecting certain absorptions. Subsequent studies revealed a variability with age which we had not appreciated and which, it seems to us, requires a compensating factor for age whenever the results of this test are considered. When we had divided our controls into ten-year age groups, beginning with the class through age 24 and ending with the class 55 to 64, we noted a consistent and appreciable increase in the higher rates with an increase in age. While this might be expected, the degree of the change was surprising. The percentage of cases (of the total in that particular age group) with an uncorrected sedimentation rate of 10 mm or less at one hour (Wintrobe tube, heparinized blood) is shown by age groups in Table 1. Obviously, if this test is applied to groups of mixed ages, suitable adjustment must be made for age or for some factor varying with age.

A variety of special tests are finding increasing application in the control of absorption in industrial exposures. Some depend upon the determination of the absorbed substance in excretory products, especially the urine. A well-known example is the determination of lead in the urine following exposures to that compound. In the case of organometallic compounds, the excretion level of the metal fraction (as the lead in tetraethyl lead absorption) may be the only or the most easily identifiable product to indicate the absorption. It does not follow that the level of excretion of the metal following the absorption of the organometallic compound has the same significance as that following the absorption of the metal as an inorganic form. Recent experience with the absorption of an organic selenium compound and the determination of the selenium fraction in the urine as a measure of the absorption has clearly demonstrated the value of this type of test. Had we merely been content with controlling the amount of selenium in the air, we would have missed a considerable absorption through the skin. In fact the particular compound penetrated

readily through rubber gloves and boots with which we thought we were protecting the individual. By means of serial samples of urine we can tell almost to the exact hour the time of a contact resulting in absorption. The cumulative graphed data on the excretion shown to the individual exposed, and to supervision, have been of considerable value in securing their cooperation in eliminating the sources of the absorption.

A useful control procedure in the case of exposure to certain dyes or intermediate compounds that can be converted into colored substances is illustrated by the method for the detection in urine of absorbed benzidine reported by Kuchenbecker.⁴ Here the urine suspected of containing the benzidine is diazotized and then coupled with another organic chemical to give a characteristic dye, which in turn will dye bits of suitable fabric added to the solution. The test can be made roughly quantitative. Many modifications are possible in identifying other similar chemicals, such as extraction and concentration of the material from dilute state in the urine and the addition of a diazotized compound to a urine containing an absorbed chemical which will couple to give a colored solution. There are many tricks that we can borrow from the dye chemists to aid in identifying these substances in the urine. With the demonstration of the absorption of compounds of this type, we have insisted on more efficient preventive measures. The delayed carcinogenic action on the mucosa of the bladder of certain substances has dictated such a rigid control.

The method in which a quantitative change in a detoxication mechanism follows increasing absorption of certain substances is illustrated by the urinary inorganic-total sulfate ratio change following the absorption of benzene. While the limitations of this test as a measure for controlling exposures to benzene are still controversial, we have found it to give useful information, especially where the concentrations of vapors are quite variable. In organic syntheses benzene is a useful

value in impressing upon supervision and the individuals exposed the desirability of more exacting control of exposures. If the presence of these absorbed compounds coincides with early evidence of toxicity, the control procedures then become imperative. A few of the specific methods that have been found useful will later be mentioned in some detail.

Several years ago we began to apply a broader base of common laboratory procedures in our studies of individuals exposed to potentially toxic materials primarily in the hope that we would be able to "screen out" certain evidences of toxicity if they existed and which, because they were not predictable, we might otherwise miss. Each individual had the following tests: hemoglobin, erythrocyte count, hematocrit, leukocyte count, Schilling index, filament-nonfilament ratios, reticulocyte count, icteric index, and sedimentation rate. From this data were calculated the mean corpuscular hemoglobin, mean corpuscular volume, and mean corpuscular hemoglobin concentration. Many additional studies were done on individuals without any significant exposure to build up a large reference control group. Physical examinations, histories, and stereograms of the chest were also completed. In many instances special tests were performed as indicated by the specific exposure, and all data were correlated with environmental studies, such as air analyses, and examination of protective equipment, such as gloves and boots, for evidence of exposure. Animal studies in certain cases were a valuable adjunct. The results obtained from the application of the more common laboratory tests have, in many respects, been quite illuminating. They have shown the necessity of obtaining the norms for these procedures from the same class of individuals as those being studied for the effects of special exposures. Particularly have they emphasized the variability of values—first, in the methods themselves and, second, as obtained in samples of representative workmen. Our data have not attempted to define the absolute limits of "normal" in the sense that "normal" means an optimum of health, but rather represent a cross section of employees who exhibit variable degrees of foci of infection in teeth, tonsils, and prostate, and other minor nondisabling conditions expected in such a group. We intend to present in the near future the complete studies on some 500 men but wish to point out here one or two of the more interesting observations.

The application of statistical methods in

dealing with the data from groups larger than 20 has been very useful. Recently, Greenburg and his co-workers¹ have shown that an increase in the mean corpuscular volume (and judging from their data, the mean corpuscular hemoglobin, although they did not stress this factor) is one of the most significant early hematologic changes resulting from exposure to benzene (benzol). It is interesting that we have found similar significant increases in these indices in certain exposures to butyl alcohol and gasoline, suggesting that this finding may have even wider application. No other abnormal laboratory findings were observed in these groups with the increased MCV and MCH, except a slightly elevated reticulocyte count. Most of the hemoglobin and erythrocyte counts were within the limits that we have come to accept as "normal." The significance of this change in the amount of hemoglobin per erythrocyte and the volume of the individual erythrocyte is not certain. We have taken the conservative (though perhaps needlessly stringent) attitude that these findings, even in the absence of any other sign, predicate a more rigid control of the exposure. Caution must be observed in placing too much value on a single or few isolated variations of these values. The considerable variability of such common laboratory tests as the hemoglobin determination and cell counts is not generally recognized, and the careful standardization of methods must be scrupulously done. We feel that the range of "normals" reported by Wintrobe² and usually cited in textbooks is not broad enough for industrial groups such as ours. The range of values (white men, aged 18 to 65) including 95 per cent of all cases (excluding groups that varied significantly) are mean corpuscular hemoglobin, 25 to 33 (Wintrobe—27 to 32), mean corpuscular volume, 76 to 101 (Wintrobe—80 to 94). There is no appreciable variation with age (from 18 to 65) of these indices.

There is considerable controversy concerning the significance of leukocyte counts and differential counts. There is a much greater variability in the method than is generally appreciated. Thus, Berkson, *et al.*,³ have shown that with the usual technic of counting 4 sq mm (one pipet, one side of the counting chamber), even though the equipment is all carefully standardized and the test accurately performed, such a count is determined significantly only within ± 21 per cent. As larger groups of individuals without special exposures are reported, the limits of "normal" are extended, especially has this been true of

out, it is a difficult problem to detect impairment before the development of advanced degrees of pathologic change

For a long time the use of threshold values has been employed by engineers and others interested in the control of toxic substances in industry, and, as Dr Sterner points out, such levels do not preclude the possibility of poisoning in susceptible individuals

The conjugation of substances in the body and their excretion in the urine are protective measures that may be utilized for the purpose of detection and prevention, and the patch test is of

tremendous value in the field of dermatitis prevention. A still more valuable indication is the slight but consistent changes in the blood which may be detected in workers exposed to small amounts of toxic materials. It may very well be that some time in the future we will have a still more sensitive index.

There still remains a real need for a sensitive index of early physiologic changes prior to the advent of disease.

Dr Sterner's paper has presented a clear and lucid discussion of this important problem.

ALUMNI DAY—NEW YORK UNIVERSITY COLLEGE OF MEDICINE

Alumni Day is Saturday, March 22. The dinner will be Friday night, March 21, at the Roosevelt Hotel. Speakers include Chancellor Chase, Dr James R. Angell, and Somerset Maugham. Send your reservation to 100 Washington Square East, New York City.

The program for the Sixth Annual Alumni Day—March 22—is as follows:

- 10 00 A.M. Greetings to the Alumni
Luther B. MacKenzie, '04, President, Alumni Association
- 10 10 Today's Program
Arthur M. Wright, Chairman, Committee on Science and Education
- 10 15 The Relation of the School and the Hospital to the Development of Clinical Teaching
Claude E. Heaton, '21, Assistant Clinical Professor of Obstetrics and Gynecology
- 10 35 Is There a Surgical Solution for Hypersensitivity of the Carotid Sinus?
John H. Mulholland, '25, Assistant Clinical Professor of Surgery
- 10 55 An Approach to the Problem of Management Presented by the Patient in Coma
Emery A. Rovenstine, Professor of Anesthesia
- 11 15 What Is the Present Status of the Shock Treatment in Schizophrenia?
Karl M. Bowman, Professor of Psychiatry
- 11 35 The Diet of the Infant in the Early Months
Charles Hendee Smith, Professor of Pediatrics

- 11 55 Surgical Personalities of the Past
Arthur M. Wright, the George David Stewart Professor of Surgery

Luncheon will be served at 12 30 P.M. in the Wyckoff Memorial Lounge, 338 East 26th Street at First Avenue—Luncheon Tickets, \$1.00 per person. Speakers will be Dean Emeritus Samuel A. Brown, '94, Dean Currier McEwen, '26, and Nathan B. Van Etten, '90, President, American Medical Association.

The afternoon program is as follows:

- 3 00 P.M. The Development of the Pre-Clinical Departments at the Medical College
George B. Wallace, Professor of Pharmacology
- 3 20 The Rehabilitation of the Patient Subsequent to Myocardial Infarction
Clarence E. de la Chapelle, '22, Professor of Clinical Medicine
- 3 40 The Preparation of Human Hemoglobin as a Possible Blood Substitute
R. Keith Cannan, Professor of Chemistry
- 4 00 The Role of Specific Antipneumococcus Immunity in Patients with Pneumonia Treated with Sulfonamide Compounds
William S. Tillett, Professor of Medicine
- 4 20 What Is the Basis for Rational Endocrine Therapy in Gynecological Conditions?
Howard C. Taylor, Jr., Associate Professor of Obstetrics and Gynecology
- 5 00 Social Hour with Dean McEwen—Dean's Office

There will be demonstrations and exhibits during the morning and afternoon.

SHAKE!

Patient (in operating room) "Doctor, I am very nervous. This is my second operation."
Doctor "What have you got to be nervous about? This is my first."—*Medical Record*

A CRASH OR A CRUSH

Some have said, 'The fellows who drive with one hand are generally headed for the aisle of a church. Some of them will walk down it and some will be carried.'

solvent, and the variations of handling it make difficult a uniform control method. Changes in sulfate ratios have aided materially in pointing to unsuspected breaks in protection against absorption of benzene.

We have been quite interested in the excretion of porphyrins as a means of determining the toxic effects of certain substances. The apparent complexity of the whole problem involving the chemistry and the metabolism of these pigments is sufficient to discourage most people who might have an interest in them. However, the accumulating data indicating an abnormal porphyrin excretion after administration of lead, arsenic, mercury, and sulfanilamide and, more recently, the finding of excessive amounts in the urines of chemical workers⁵ suggest that there may be considerable value in studying the excretion of these substances. The excellent article by Watson⁶ is to be recommended highly to those interested in the problem. He points out that a ready method for distinguishing type III porphyrins (found in quantity in the urine chiefly in certain toxic syndromes) from type I (normally present in small amounts in urine) will add greatly to the usefulness of the procedure. Most of the studies reported have been done on twenty-four-hour or larger samples. We have noted considerable variation in the porphyrin content, both on a per hour and a per sample basis, in individual samples of urine before and after moderate exposures to organic amines but the cases are too few to be more than suggestive. Much work must be done on determining the limits of normal excretion under varying conditions of diet, exercise, etc. The correlation of the porphyrin data with that of the hemoglobin, erythrocyte, and reticulocyte values and the excretion rates of urobilinogen in urine and feces will permit a much more accurate picture of the hematologic state and the factors affecting it. While a great deal must be done to make the methods available for clinical application, we feel that the future importance of this approach is of sufficient promise to warrant stressing.

Other special technics that have been of value under certain conditions will not be discussed here. However, there is a fertile field in industrial toxicology for the development of these technics. They are far from being of mere academic interest, and we have found them of great value in indicating accidental absorptions and in helping to persuade both workmen and supervision of the necessity for better protective measures.

In approaching the problem of controlling exposures involving new and untried chemical compounds, one must consider the absorption of the substances as harmful until there is abundant evidence to prove otherwise. The role of the skin as a portal of entry deserves more attention than is generally given it. Since in many instances we cannot surely anticipate evidences of absorption and early toxicity, we have included in our physical control a variety of common laboratory tests, hoping to "screen out" any early abnormalities. Signs of injury to liver, blood, and kidney can be detected at fairly early stages, and we believe that where the statistical analysis can be applied abnormal changes can be detected in a group before any of the individual values have appreciably exceeded the "normal" limits.

Summary

Some of the experiences gained in the study of exposures to some ten to twelve thousand different organic chemicals are related.

1. Dermatitis, chiefly of the sensitization type, has been numerically the most important disability. The patch test and pre-exposure testing are discussed.

2. Methods for detecting absorbed compounds in excretory products and for determining early evidences of toxic effects are considered. The necessity of preventing such absorption is stressed.

3. A "screening" application of a number of common laboratory procedures when the exact type of toxic effect cannot be anticipated is discussed, and some facts are presented as to variations of these values in certain exposures and as to ranges of normal values.

Discussion

Dr Leonard Greenburg, *New York City*—Dr Sterner has presented a very interesting and succinct discussion of the important approaches leading up to the detection of incipient functional impairment in animals exposed to the absorption of toxic agents. As he so well points

Most of these will take care of themselves, but all are potentially dangerous. Whenever there is any question of a foreign body—metal, wood, or dirt—these wounds should be incised, explored, cleaned out, and left open. The giving of tetanus antitoxin is a decision for the individual doctor. Unfortunately, its use has become almost a ritual which, however, is losing its importance as are most rituals. Personally, my faith in it has steadily diminished over the years, and I practically never use it. I believe I have seen more harm from the use of tetanus antitoxin than good.

Lacerations of the skin and less important soft parts call for cleansing of various degrees. Restraint of our perfectionist attitude is the most important factor in their management, it is difficult to control our desire to attain a nice looking wound. Sutures add trauma, and a perfect closure may be the determining factor in allowing the development of infection in a wound that would have remained clean if left open or, at most, only approximated by a suture or two. Closure can be made with impunity after a few days—if anything is to be gained by it. The removal of known devitalized tissue is good surgery, but the carrying of this procedure to the degree deemed necessary for use of the term "debridement and closure" may be bad surgery. Our human perceptions are rarely fine enough to keep us from adding insult to injury.

Wounds involving injury to tendons and/or nerves must be carefully judged as to their fitness for care in the office. Extensive search for a retracted proximal tendon usually requires more of an operative setup than is available. In general, if these injuries are seen at once, or within a few hours, and are capably cleansed, suture may be done—preferably with fine silk and certainly with meticulous gentleness. Infection here is particularly the black beast to be avoided. When in doubt I prefer to leave these wounds open, bathing them in normal saline or Ringer's solution for several days and closing them only when I am sure there is no infection. If more than several hours have elapsed and the wound is badly soiled, I believe it is safer to avoid the additional trauma of repair until the question of infection is settled.

Wounds in which there has been removal of areas of skin should be cleaned, and skin grafts should be applied at once—as soon as feasible if infected. The grafts are covered with gauze saturated in saline solution. Dressing is done after three or four days. The grafts will have taken in forty-eight hours if they are

going to take. When grafts are to be applied to an infected or granulating surface, they are cut into pieces about $\frac{1}{4}$ by $\frac{1}{4}$ inch. I prefer grafts cut in strips, practically full thickness in the middle and thin as Thiersch grafts at the edges; these are easily cut along the raised surface of the novocain infiltrated skin with a sharp scalpel. The areas left are treated with tannic acid and silver nitrate.

Most dislocations may be successfully reduced in the office. A dose of morphine—adapted to the size of the individual—followed, after time for action, by slow careful manipulation will usually accomplish the desired reduction. Fractures of the bones of the hands or feet are usually amenable to treatment. The relaxation obtained by the action of novocain in these cases makes reduction easier. Maintenance of reduction is the same problem in the office as in the hospital. In general, avoid the use of casts or splints wherever possible. To apply a cast over an undisplaced fracture of the fibula or metatarsals is unnecessary. The mere presence of a crack in the bone, as shown by x-ray, is too often interpreted as an indication for prolonged fixation. Patients with fractured metatarsals properly reduced will get about surprisingly soon if not prevented by a cast.

The injection with novocain of so-called sprains gives immediate comfort to patients. This may tempt them to too great activity and much pain several hours later. It does not allow the return to active work. It cannot take the place of time and rest in the repair of trauma.

I hesitate to take up the subject of back strain. In my opinion there is no other subject in such a mess with regard to diagnosis and treatment. A given case of low back pain can go the rounds and be labeled with as many different diagnoses and suggestions for treatment as representatives of groups of thought and training. In the experience of the insurance companies none of these conclusions is much more accurate than a diagnosis arrived at by shaking dice. The representatives of each group are as sure of themselves—to hear them tell it—as an economist, whether old or New Deal. I believe that most back cases represent muscle strain or tear and that the most important factor in treatment is rest until such time as objective symptoms disappear. Whether or not a patient can be satisfactorily rested at home depends upon the intelligence of the patient as well as his economic situation. If there is no improvement after a week's rest, either the patient is not resting or he is exag-

THE OFFICE TREATMENT OF INDUSTRIAL ACCIDENTS

HOWARD L. PRINCE, M D , Rochester, New York

THE office treatment of industrial trauma must be influenced by the facilities at hand and the amount of dislocation of office routine a given case may produce. Any discussion of office treatment must consider, first, the benefit to the patient and, second, the benefit to the doctor.

The more immediate the care of trauma the more certain it is to be successful. The chances of cleaning up an infected wound or preventing infection in a contaminated wound fade with the minutes. Office hours usually cannot be interrupted to rush to a hospital and, anyway, why rush to a hospital? In any busy hospital there is a lag of about one hour under the best of circumstances, and usually the operating facilities are tied up for several hours—not to be interfered with except for emergencies. A soiled, lacerated wound is seldom considered an emergency. Delay in cleaning up a wound may cost the use of a hand or it may be of vastly greater importance than delay in removing the appendix or gall-bladder already booked. In an office the condition can be cared for in less than the time required to get well under way in a hospital and without too much interference with office routine.

To accomplish this the office must have sufficient space and enough help so that the case in question will not tie up the facilities for the care of nonindustrial patients. I am considering the problem from the point of view of the doctor in whose practice industrial trauma does not play a major part. We do a good many operative procedures in our office because it saves our time and saves expense for the patient.

We have sterilized syringes and various-sized sterilized needles. A sterile $1\frac{1}{2}$ per cent solution of novocain in 1-100,000 epinephrine is kept in rubber-topped bottles ready for use. Sterile dressings are on hand. Knives and scissors are kept in sterile solutions after careful washing between uses. Instruments are boiled as needed.

The patient is examined to decide whether or not the condition can be taken care of in the office and what should be done. A small area outside the wound is cleaned and prepared for injection of novocain, from this or additional

areas the injections necessary to anesthetize the traumatized parts are made. We then get on about our business for fifteen or twenty minutes. By this time anesthesia is complete and attention to the toilet of the traumatized part is in order. Whether soap and water scrubbing or chemical sterilization is the method of choice is immaterial—either can be done leisurely and with due consideration for the tissue involved. In general, no antiseptic alone is as certain as soap and water scrubbing. In a deeply lacerated wound with extremely dirty skin around it, it may be advantageous to pack the wound with vaseline gauze while the surrounding skin is being scrubbed. Dry, sterilized gloves are put on for the cleansing and for the reparative procedure. When finished and dressed, the patient is given several tablets of codeine or morphine for use for pain, and he is instructed about resting the injured part. We are too prone to forget that rest of a wounded part is a most important assistance in the avoidance or overcoming of infection. Many severe hand infections result from too early use. The use of practical splinting to protect wounded parts from motion is of great importance.

If infection is feared, the patient is asked to return the next day, if not, the patient reports as to his feelings at the end of twenty-four hours, and, if the report sounds all right, the return may be postponed for as long as seems desirable. Most wounds are dressed too often. The main reason back of many dressings is the doctor's curiosity. Wounds in which infection is developing give symptoms of which pain is the chief one. Dressing of the symptomless wound before healing time has elapsed accomplishes nothing except pain for the patient, and every dressing done before healing adds a chance for infection. Assiduous pulling down of dressings is less a mark of a careful doctor than of an uncertain doctor who lacks a proper conception of the healing processes. A comfortable trauma—whether of bone or soft parts—is seldom aided by the glance of the medical eye. On the other hand, any complaint of pain increasing or developing after a period of comfort calls for thoughtful consideration.

Among the commonest industrial traumas coming to the office are puncture wounds

office equipment, reduction of many fractures under local anesthesia may be added to the list, thereby overcoming a delay of several hours.

I am at variance with the speaker on the point of tetanus antitoxin, I feel it is our duty to give them tetanus antitoxin. A test should be given as to sensitiveness.

I believe that patients presenting soiled, open wounds, deep puncture wounds, and particularly wounds that have been sustained out-of-doors should, whether they have been debrided or not, receive tetanus antitoxin.

It is undoubtedly true that the use of tetanus antitoxin has become almost a ritual, but I have seen tetanus develop in one of my own patients who sustained a lacerated finger in the gears of a machine inside a factory. It had been a routine procedure at that time to administer tetanus antitoxin, and I believed that this patient had received it. On the ninth day following the injury he developed abdominal and neck rigidity and the characteristic facial muscle contractions. It was only when going through the records in the accident room of the hospital that I ascertained that the patient had not been given the prophylactic injection. Only the delayed onset and the employment of several hundred thousand units of antitoxin administered intravenously, intraspinaly, and intramuscularly saved the life of this patient.

Pyogenic infection superimposed in a wound is another factor that adds to the period of disability.

Dr Prince has emphasized the importance of thorough debridement and avoidance of tight closure of the wound. I think we are all in agreement with that procedure.

There are no doubt some physicians who have unnecessarily hospitalized patients for the aforementioned minor injuries, thereby delaying their treatment. It was undoubtedly early observation of this needless delay that influenced Dr Prince to carry out the practice and arrive at the conclusions he has so ably presented.

Dr James M. Hitzrot, *New York City*—I know office treatment in traumatic surgery can be done by the men who will take the trouble to do it.

Living in New York City, I feel that tetanus antitoxin has a place in the treatment of wounds. I agree with Dr Prince that every wound that comes in should not receive tetanus antitoxin. The question requires some thought. I personally have a strange fear in giving tetanus

antitoxin to every patient. However, I do not feel that it should not be given at all.

Where a physician is doing a great deal of industrial work, he probably has the necessary office equipment and certainly can save time for the patient and the doctor.

Dr Prince has brought to our notice a rather important subject, and it would be difficult to disagree with him.

I am particularly happy to hear him say that the treatment of an injury should be immediate, that soap and water are the best cleansing agents, and that local rest is an essential adjunct of wound treatment. General lassitude and rest are on the preferred payment list of our government agencies, perhaps we can get them interested in local rest.

He has raised so many essential points that I would have to write a paper to cover all the points he has raised, but may I congratulate him on one form of treatment he has used which is very valuable—namely, the use of brains.

To do office treatment properly requires proper office equipment, assistants, and the requisite training of the doctor. Without any one of the above three, office treatment, in fact any treatment, will be inadequate.

There is no reason why any properly managed hospital should not have an emergency operating room equipped to serve accident cases without any delay. Also any large industrial plant with work that has a probable hazard should, I believe, have an equipped emergency room to provide facilities for the doctor. Where neither of these are available Dr Prince's suggestion is worthy of earnest consideration.

To discuss the inadequacy of medical fees and some of the ridiculous medical schedules would carry me too far afield. Our province as I see it is to render to the patient the best that is in us and, having done that, hope, vainly perhaps, that somehow manna will fall upon us.

Dr Prince (*Concluding Remarks*)—My idea of tetanus antitoxin probably goes back to the days when I was a boy. My father was the doctor in our town. We had farm yards where everything happens to the feet, for a period of many years there was no tetanus antitoxin.

When the doctor himself will give tetanus antitoxin in all cases to his own family, then perhaps I will have more faith in it. Until someone can say tetanus antitoxin has more effect than it seems to have in recent studies, I cannot see using it.

GIVE HIM ONE MORE CHANCE

Doctor (after examination)—"I must tell you frankly, I don't like the looks of your husband."

Patient's wife—"Well, I admit he never was a handsome man, Doctor, but he's so good to the children."

generating his complaints and hospital care may be indicated.

A hard bed is most effective for back rest. In severely painful cases I believe in the use of some derivative of opium to the point of relaxation for the first three or four days. The application of local heat is comforting, and adhesive strapping, properly located, is helpful. Having the patient become ambulatory to go to the office every day or two for treatment is no part of rest, and I know of no modalities at our command which justify this procedure. The case should be judged by the clinical findings rather than by x-ray study. I have an idea that office-treated back cases would do better with less x-rays and more sense. Considering the fact that the majority of laboring people over 40 show more or less so-called hypertrophic or osteoarthritic changes in the spine, why should the x-ray film assume the overwhelming importance that it has? The clinical side is the important side. A backache severe enough to produce disability should show objective signs, there should be limitation in motion and muscular spasm. Muscular spasm should be present in any position which puts strain on the injured part. When muscular spasm disappears, the individual is approaching the end of his disability regardless of how much pathology the x-ray films may show. Most of the pathology shown in x-ray films has been there for some time.

At this time an injured workman should be treated with as much consideration as would be extended his employer under similar circumstances. The desire of the employee drawing accident insurance to prolong his period of actual disability is quite generally noticeable. A certain degree of this very human reaction must be condoned in the laborer who is usually going back to much harder physical work. The getting of something for nothing is a deep-seated trait in us humans. On the other hand, we should always remain keenly aware that this trait may lead to exaggeration of discomfort and, many times, to malingerer. Also, we should not forget that many a man works at the expense of some discomfort and handicap.

I am thankful that bone and spinal canal operations are not included in office treatment. The tremendous difference in their evaluation by the advocates on one hand and the insurance companies who pay the shot on the other should arouse a suspicion that we operators are inclined to view the results prematurely or through rose-colored glasses.

From a practical standpoint the office treatment of industrial accidents carries little advantage to the doctor other than the knowledge that he has done the right thing by the patient. The use of local anesthesia is of paramount importance in handling these cases, and the anesthetists have seen to it that, while their fees are proportionately high, the use of local anesthesia by the doctor carries no reward. A comminuted fracture of a finger, calling for skeletal traction and the application of a rather complicated dressing to achieve this, usually consumes an hour of the doctor's time. An anesthetist would receive \$15 for this hour while the responsible attendant would be allowed \$20 for his hour and the ensuing three weeks of care. Care of the simplest injury in an office entails a certain amount of disorder and interference with office routine. In the more complicated cases the resultant disorder may consume considerable time. It is probably easier to send the case to the hospital and take care of it when convenient, employing a general anesthetic and the operating room. This will, of course, cost the insurance companies from \$25 up, depending upon the locality. They seem perfectly agreeable to this expenditure, and the doctor, is, perhaps, of more importance in the operating room than in his office.

277 Alexander Street

Discussion

Dr. Ralph F. Harloe, Brooklyn.—The title of Dr. Prince's paper is a popular one.

The speaker has emphasized the importance of adequate space, experienced office help, and the proper equipment for the office treatment of many patients suffering from industrial accidents.

Not only is this important in its relation to industrial accidents, but an office so arranged may save many nonindustrial patients the inconvenience and expense of hospital confinement be it one day or several days.

The number of patients admitted to hospitals for a day or more for minor operations, including such ailments as chronic paronychia, anterior-closed space infections as felons, small fibroadenomas, lipomas, cysts, etc., are numbered in the thousands. The reason may be one of several improperly equipped offices, a neurotic patient, or it may be that in some localities of our great state where privately owned institutions are located hospitalization and administration of a general anesthetic has as its reward, a larger fee.

As Dr. Prince has emphasized, local anesthesia intelligently administered in selected cases offers advantages that we might well avail ourselves of.

If an x-ray or fluoroscopic unit is part of the

mary of a survey of the medical conditions presented by over 6,000 patients treated at the Saratoga Spa in 1936 (see Table 1) *

Now just what does a spa offer for these convalescent cases? Florence Nightingale in 1863⁷ said "The first necessity of a convalescent hospital is that it should not be like a hospital at all, and the very best kind of convalescent hospital would be a string of cottages. The reasons for this are (1) to get rid of the idea of being in a hospital altogether from the minds of the inmates, and to substitute for it that of a home, (2) to secure a more free and bracing atmosphere than can ever be secured in any building containing a larger number of inmates." While Florence Nightingale was not speaking of a spa for convalescent care, many of her suggestions are possible of attainment at a well-organized spa.

Many patients dislike going away for a period of convalescence because they fear that the new physician will be unfamiliar with their past history. It is of major importance that a close relationship be established between the regular attending physician and the physician at the convalescent resort. The benefit to the patient of this close relationship cannot be overestimated. A complete report from the family physician is greatly appreciated by the physician at the spa. It not only saves considerable time for the patient but also the money that might be spent for examinations duplicating those made at home. The prescribing physician at the spa should have a thorough knowledge of the patient's condition before attempting to direct his convalescent program.

The first consideration of the patient coming to the spa for convalescent care is a selection of his medical advisor. The importance of this cannot be overemphasized, since there is much misinformation among the laity in Saratoga Springs concerning the use of the treatments and the waters. Careful study of the analyses of the waters shows them to be the most important of their class to be found in any spa in the world. They should always, either at the springs or in the home, be administered on the advice of a competent physician who is familiar with the patient's condition. A satisfactory arrangement from the day of arrival at the spa is possibly half the battle in getting well. It is well to select a medical advisor even before a boarding place has been chosen. Under the prevailing conditions many of the proprietors of hotels and boardinghouses aim to please the new patient with a great abundance and variety of foods that are not at all

TABLE 1

	Primary Condition	No of Patients	Per-centage
1	Heart and circulatory disorders including variations of blood pressure	1,947	30.8
2	Rheumatic conditions including arthritis, myositis, fibrositis, and neuritis	1,493	23.7
3	Gastrointestinal ailments, including liver and gallbladder	1,114	17.6
4	Nervous conditions including both functional and organic disorders	533	8.4
5	Metabolic diseases including diabetes, obesity, and glandular disorders	257	4.1
6	Skin diseases (noninfectious)	133	2.1
7	Miscellaneous	199	3.2
8	No disease, including general debility	639	10.1
	Total	6,315	100.0

suitable for the average patient who comes here for convalescent care. So, the importance of being guided in the selection of a boardinghouse or hotel that will accurately follow a dietary scheme and routinization with the spa waters for the particular individual being treated is of major importance.

The mineral waters that are available at the spa are indicated internally in a wide range of convalescent cases. They may be divided into three major groups:

- 1 The alkaline, effervescent, noncathartic waters, represented by Geyser, are indicated in chronic gastric diseases and where the effect of a general tonic water would be of value.
- 2 The alkaline, mildly saline group, such as Coesa water because of its mild laxative action, is safely used in catarrhal diseases of the gallbladder and in the milder forms of irritated colons.
- 3 The alkaline, strongly saline waters, of which the Hathorn Nos 2 and 3 are the best representatives, are used primarily for the relief of constipation.

In addition there is a pure, noncarbonated, mineral-free water, the State Seal, which is indicated in acute gastric diseases and in the various forms of kidney diseases.

The mineral baths and other forms of hydrotherapy may well be considered the *pièce de résistance* in the care of practically all of those convalescent patients, and the routine to be followed is quite variable, depending entirely on the type of individual and the nature of the ailment from which he is convalescing. The balneotherapeutic procedures available include

- 1 The use of the mineral-water baths alone, either in the form of full gas

CONVALESCENT CARE AT THE SARATOGA SPA

EDWARD J. CALLAHAN, M D, Saratoga Springs, New York

CONVALESCENT care is an important subject in the practice of medicine, and today it is attracting more and more attention on the part of the general practitioner. The importance of convalescent care and the necessity of bringing it to the minds of general practitioners are so important that the Public Health Committee of The New York Academy of Medicine formulated and published in 1925 a set of standards for convalescent care.¹ A recent review of these standards emphasized the lack of general knowledge regarding the whole subject and the necessity for further study.

At The New York Academy of Medicine on November 9 and 10, 1939, a two-day symposium on the problem of convalescent care was held and about twenty papers were presented.² An excellent paper by Woodruff³ reviews in detail these reports and it is well worth reading. Diseases given special consideration at this symposium included cardiac diseases, renal disorders and infections of the urinary tract, gastrointestinal and respiratory ailments, cancer, postoperative hyperthyroid states, psychiatric disturbances, various neurologic diseases, surgical operations, and orthopedic conditions, as well as the recently delivered mother.

In this symposium the outstanding fact disclosed was that none of the facilities available meet the medical problems involved with the exception of the provision of convalescent care for patients with heart disease. The fact remains that the disease rather than the patient is still the primary interest of most physicians. One of the points emphasized and re-emphasized in the symposium was that unsatisfactory results in convalescent care will continue until it is generally accepted as a fundamental principle that in convalescent care attention must be directed toward the patient as one who has been ill and is recovering and has particular and individual problems to be considered in his course to recovery. The new thought, then, in convalescent care seeks to satisfy the special requirements of the individual who is trying to get well rather

than the convalescent care of pneumonia, rheumatic fever, or duodenal ulcer.

I wonder if we all think along the same line when we use the term convalescent care. One of the best definitions of convalescent care I have ever seen is the following taken from an article by E H L Corwin: "The present-day idea of convalescent care is that of a creative dynamic force, applied to persons recovering from either acute diseases, or operations, or from the exacerbations of chronic maladies, a force which brings into play all the resources of mind and body, of medicine and psychology, to offset the baneful somatic and mental effects of illness. It comprises play as well as rest, it invokes religious emotion and an appeal to reason, it calls for the exercise of mind as well as muscle, it furnishes comforts and stimulates purposeful effort, it provides dressings for surgical wounds and installs sound health habits, it aids the natural recuperative processes and develops social discipline, it expedites recovery and strengthens character. Its aim is restoration of the adult to a state of health, mental poise, and usefulness and of the child to the usual activities of childhood. Convalescent care saves, or should save, the patients the anguish of relapse and of a repeated malady, it saves, or should save, the communities the cost of preventable illness."⁴

Woodruff³ in reviewing the paper by Pepper¹ at the symposium agrees that no two diseases or two patients ill with the same disease can possibly have the same state of bodily and psychologic conditions after the illness subsides and convalescence begins. He adds: "Certainly, at any rate, if in convalescence there are persistent deviations from normal metabolism, nutrition, body chemistry and physiology, restoration to health may well be expedited if attention is directed to correcting these abnormalities, and, again in this connection, stressing the importance of the individual, not until we learn to recognize in each convalescent the actual abnormalities which persist from the preceding illness and which differentiate that individual in convalescence from his condition in health can we meet properly the therapeutic indications in his particular case."

In comparison with the list of diseases taken up at this conference I am including the sum-

¹ Read at a meeting of the Fourth District Branch of the Medical Society of the State of New York held at Schenectady, New York on October 1 and 2, 1940 and at a meeting of the Medical Society of the County of Schoharie held at Cobleskill, New York on October 8, 1940.

THE MANAGEMENT OF CLINICAL PROBLEMS INVOLVING THE LARYNX IN INFANCY AND CHILDHOOD

CLYDE A. HEATLY, M D, Rochester, New York

IN ANY discussion of the management of clinical problems involving the larynx in infancy and childhood, attention must be directed immediately to the anatomic peculiarities of the larynx in early life, for herein lies the explanation not only for the frequently stormy manifestations of otherwise mild infections but also for the unceasing vigilance on the part of the physician which a successful outcome commonly demands. The relative smallness of the larynx in infancy, its great irritability, and the ease with which obstructive edema may be produced are indelibly impressed upon all who engage in bronchoscopic work. The structures bounding the upper aperture of the infantile larynx are soft and readily collapsible. The epiglottis is narrow and folded longitudinally, presenting a deep gutter-like posterior aspect. In consequence, the soft yielding aryepiglottic folds are drawn together so as to effect a relative narrowing of the upper laryngeal aperture. The infantile glottis is also proportionally smaller. According to Tucker¹ the anteroposterior measurements vary from 7 to 9 mm., with the subglottic larynx 1 or 2 mm. smaller in diameter in the same subject. The latter measurement is of great importance because the subglottic area is completely surrounded by the cricoid ring and, therefore, is not capable of instrumental dilatation. The cartilages of the larynx of the infant are much softer and more liable to collapse in the case of a laryngeal condition associated with stenosis. The mucous membranes are more vascular as well as more loosely attached, especially in the normally narrow subglottic area. Dangerous obstructions complicating acute infections or instrumental manipulation are, therefore, especially common and may result in asphyxia unless promptly recognized and relieved.

The Acute Larynx

The management of the acute larynx in infancy frequently presents problems in diagnosis and treatment of unusual difficulty. There can be no question that the facilities of a well-equipped hospital are indispensable in these

instances. The importance of a careful history must be emphasized. Particular inquiry should be directed here to previous attacks of hoarseness or croupiness, to concomitant acute infections in other members of the household, and to any recent episode of choking or gagging suggestive of a foreign body. The literature contains many reports of acute laryngeal disturbances caused by an unsuspected foreign body, and yet it is not commonly appreciated how closely these cases may simulate laryngitis of infectious origin. The following record illustrates this conclusion.

A W., aged 17 months, was admitted to Strong Memorial Hospital on November 17, 1928. Two weeks before admission, slight hoarseness developed, but the child did not appear ill or feverish. The following day, however, she seemed decidedly worse, and the family physician was called. Diphtheria was suspected and antitoxin was administered. Cultures, however, were later reported negative. Nevertheless, some apparent improvement was observed for several days although the hoarseness continued unchanged. Twenty-four hours before admission, signs of laryngeal obstruction appeared. These increased rapidly, so that when the child was finally brought to the hospital an immediate tracheotomy was necessary. Following this she improved rapidly, and on the fifth postoperative day direct laryngoscopy was performed. The larynx appeared markedly edematous, and in the glottic chink was found a large fragment of eggshell. This was removed. The laryngeal edema rapidly subsided and decannulation was possible on the tenth postoperative day. No subsequent difficulty ensued. In reviewing the history with the mother in the light of these findings, she recalled that a choking attack had occurred while feeding the child a hard-boiled egg the day before the onset of hoarseness.

Accurate diagnosis is of particular importance in these acute disturbances. For many years this depended on inferential rather than differential methods. The perfection of the technic of direct laryngoscopy now permits not only careful inspection of the larynx and its adnexae but the removal of secretions or membranes for bacterologic study. The recent spectacular advances in chemotherapy have given a tremendously increased importance to securing careful cultures from the throat and larynx in these cases. Implan-

strength baths and full position in the tub or modified mineral baths in which the strength of the carbon dioxide gas or the position of the patient in the tub is varied

- 2 The mineral bath may be followed either by a general body massage or by the use of hot mineral packs to local affected areas either with or without local massage and movement. The frequency of this combination of bath and massage depends again on the ailment from which the patient has been suffering
- 3 The eliminating treatment consists of variable combinations of heat, underwater massage, and douches, using plain water. Either the hot room or the electric cabinet may be used, associated with the various forms of underwater messages, water rubs, and salt and soap rubs and followed by the alternate hot and cold sprays
- 4 The combination of either the mineral bath plus the body massages, local or general, or the mineral baths plus the body massage plus the many varieties of the eliminating routine may be used

In addition to the actual bathing procedures, there are available at the Saratoga Spa many associated treatments, such as colonic irrigations and mechanotherapy (Zander department) in which, through the use of these various mechanical appliances, restoration of damaged joints, muscles, and tendons is accomplished. Also ultraviolet treatments, diathermy, and local mud packs are available. One of the newer departments, which has become active, is the department for treatment by inhalation. Here various forms of oils and medicaments as indicated are used in con-

junction with the inhalation of the mineral waters

The attending physician with a little effort can plan spa activities such as tennis, golf on a therapeutic golf course, archery, swimming in an outdoor swimming pool, and horseback riding. Walking on paths that are graduated as to distance and elevations, which take the patient through some lovely woods and grounds surrounding the various bathhouses, is beneficial. Considerable time should be spent with each of the patients to determine what mode of supplementary spa therapy is best fitted to each case. Unless the patients are fully occupied they frequently become restless and complain of lack of activity.

To summarize briefly, it is important that (1) the patient's care at the spa be supervised by a physician who is thoroughly conversant not only with the physical condition of the patient to be treated but also with the principles of external and internal hydrotherapy and adjunct treatments as practised here, (2) that he select a hotel or boardinghouse whose proprietor will try to follow the dietary regimen that is outlined by his medical advisor, (3) that he avoid indiscriminate and unlimited use of the waters while at the spa

DOCTORS' WIVES BACK HUSBANDS

In a mass protest against the National Federation of Woman's Clubs' endorsement of the Wagner Bill, New Jersey doctors' wives have walked out of the organization. The action was taken through the New Jersey State Medical Society women's auxiliary, which severed its affiliation with the federation.

Explained Mrs G E McDonnell, of Mt. Holly, auxiliary president: "The medical society does not agree with the health policy of the bill. As we are part of the society, we could not approve anything contrary to the society."

MORE ATROCITIES

From the Scranton (Pa.) Times

London, Dec 11 (UP)—Police and air-raid wardens warned Londoners yesterday against a new, deadly German bomb which resembles a gas mask container and explodes in the hands of anyone who picks it up.

Bombs of this type were scattered about London during the ferocious all-night German raid Sunday night and Monday morning.

The bomb consists of a metal cylinder, which contains a small bomb and from which dangles about five inches of wire.

—J.A.M.A.

tory stridor with intermittent cough was noted. Generalized coarse rales and some decrease in breath sounds at the left base were reported. Fluoroscopic examination was entirely negative and gave no suggestion of a nonopaque foreign body. Bronchoscopy showed mild hyperemia and swelling of the larynx, especially in the subglottic area. These same changes extended into the tracheobronchial tree. Secretions were scanty. A culture obtained at this time subsequently showed *Streptococcus viridans* and diphtheroids. There was no evidence of a foreign body. The following morning signs of obstructive laryngeal dyspnea appeared, and by late afternoon they had increased to a point where tracheotomy was necessary. The child did well for the next eighteen hours but then began to develop spells of cyanosis with labored respirations. The trachea was kept as clean as possible by the frequent use of suction aided by the instillation of small amounts of normal saline. It was noted that the secretions had become almost glue-like in character. Fluids were forced by infusions and an oxygen tent was employed. Sulfapyridine in full doses was begun soon after admission and continued. In the early morning of December 22 the child suddenly stopped breathing, and all known means of resuscitation failed. Postmortem examination showed the lower trachea and the entire bronchial tree completely occluded by a thick, mucopurulent, greenish, extremely tenacious secretion which also occluded even the smaller bronchioles. The clinical and postmortem diagnosis was acute laryngotracheobronchitis.

J. P., aged 4 years, was admitted to Strong Memorial Hospital on March 11, 1940. Two days prior to admission this child developed an acute infection of the upper part of the respiratory tract accompanied by hoarseness and croupy cough. The following day he seemed definitely worse and had four attacks of difficult breathing. During these attacks he became blue. On admission to the hospital he appeared extremely ill, with marked inspiratory stridor and signs of advanced obstructive laryngeal dyspnea. The temperature was 104.9 F. Tracheotomy was performed shortly after admission. The child was placed in a croup tent, the foot of the bed was elevated, and 2.5 Gm. of sulfapyridine in 400 cc. of sixth normal sodium lactate administered subcutaneously. Six hours later 500 cc. of a similar solution containing 2 Gm. were given. It was specifically ordered that no sedation was to be given. The trachea was frequently cleaned by suction through the tracheotomy cannula. Twelve hours after tracheotomy respirations again became labored in spite of suction cleansing. A 4-mm. bronchoscope was inserted through the tracheotomy wound. Both main bronchi were seen to be filled with thick, dark brown secretion. Fifteen cubic centimeters of normal saline solution with

ephedrine ($\frac{1}{4}$ per cent) were directly irrigated into each bronchus and removed by suction. This loosened and liquefied the viscid, gumlike secretions that were responsible for the continued dyspnea and permitted thorough removal. The immediate improvement in breathing was amazing. This same procedure was necessary twice on the following day and once on the third postoperative day. Otherwise, frequent suction treatment through the cannula proved sufficient. Sulfapyridine was continued by mouth in doses of 2.5 Gm. daily for seven days, maintaining a blood level of 7.4 mg. per hundred cubic centimeters and then gradually reduced. The high fever came down nicely over this period. *Pneumococcus* type IV was cultured from the secretions. Decannulation was possible on the seventeenth postoperative day, and the subsequent recovery was uneventful. This child owes his recovery to the unceasing vigilance of my resident, Dr. Tipple.

C. H., aged 3 years, was admitted on March 19, 1938. The child was extremely ill and drowsy, with a temperature of 104 F. Breathing was stridulous and labored. Marked retraction of the soft tissues about the thoracic cage was present. The white blood count was 10,000. The child was put in a croup tent but showed no improvement. Tracheotomy was, therefore, promptly performed. Cultures showed *Streptococcus viridans*, *Haemophilus influenzae*, and a few *Bacillus coli*. Sulfanilamide was begun in full doses, fluids were forced, and a transfusion of 175 cc. was given. Thick tenacious secretions continued from the tracheobronchial tree for three days and necessitated repeated careful removal by suction. After this period they decreased rapidly. Decannulation was possible on the seventh postoperative day, and the child was discharged from the hospital on the tenth day.

Comment—These cases illustrate clearly the gravity of nondiphtheritic infections in infancy. Reports vary widely concerning the organism most commonly encountered in acute laryngotracheobronchitis. The majority of cases are caused by the hemolytic streptococcus, and in these instances sulfanilamide should prove a most helpful adjunct. It is of interest, however, to call attention to the bacterologic studies of Bradford and Leahy² made in this hospital which showed the green, producing streptococcus to be the predominating organism in a series of 28 cases of nondiphtheritic laryngitis. It is, in my experience, hazardous to rely too strongly on chemotherapy alone. Early tracheotomy with frequent suction cleansing of the viscid secretions is of paramount importance. Small amounts of normal saline or dilute sodium bicarbonate solution instilled directly through

tion on Löffler's mediums and blood-agar plates, as well as mouse inoculation, will often give vital information within twenty-four hours and should be routinely carried out. The clinical manifestations of nondiphtheritic and diphtheritic infections are so strikingly similar that a final diagnosis often depends on the results of direct laryngoscopy as well as bacteriologic studies.

Careful exclusion of extra laryngeal diseases is important. It has often been said that the retropharyngeal abscess is one of the most frequently overlooked conditions in infancy, and particular attention should be directed to the laryngeal disturbances that it not uncommonly produces in the form of stridor, hoarseness, and increasing obstructive dyspnea. Failure to recognize such an abscess is usually caused by failure to consider it in the differential diagnosis, because close inspection and gentle digital palpation, as well as lateral roentgenograms of the neck, will readily reveal its presence in most instances. The following case presented a confusing picture of obstructive laryngitis until examination revealed its true character.

C. R., aged 12 weeks, admitted to Strong Memorial Hospital on March 16, 1939, was acutely ill with the clinical picture of marked obstructive laryngeal dyspnea. The child had had an infection of the upper part of the respiratory tract about three weeks previously. For the three days preceding admission he had appeared acutely ill with fever, hoarseness, rasping stridor, and increasing dyspnea. Feedings had been taken poorly and finally refused entirely. The child was sent into the hospital for tracheotomy. Examination showed an extremely sick infant exhibiting the classical signs of severe obstructive laryngeal dyspnea. Edema of the posterior faucial pillar on the left side was noted. Careful digital palpation disclosed a fluctuant swelling about the size of a small hen's egg on the left side of the hypopharynx just above the laryngeal level. Surprisingly little cervical adenitis was present but was more marked on the left side. The swelling was incised and a large quantity of pus was evacuated. Postoperative recovery was rapid and uneventful. Cultures showed *Streptococcus hemolyticus*.

Acute infections of the larynx in infancy are so frequently complicated by varying degrees of obstruction that special consideration should be given to their clinical manifestations. The picture of obstructive laryngeal dyspnea should be completely familiar to every physician, for, while the increase of dyspnea may be gradual, the transition to terminal asphyxia and collapse in infancy may be

alarmingly sudden. Respirations are rapid, labored, and accompanied by a harsh inspiratory stridor. Pallor is more common than cyanosis. The child is restless and anxious. The progress of the obstruction can best be followed by observing the degree of retraction about the thoracic cage, for with increasing dyspnea increasing retraction is noted in the suprasternal notch, the supraclavicular fossae, the intercostal spaces, and the epigastrium. Cyanosis and apathy usually denote terminal exhaustion. During the stage of restlessness sedation must be carefully avoided. In the presence of definite evidence of increasing obstruction it is sheer folly to continue watchful waiting. Tracheotomy is indicated and should be carried out promptly in the interest of safety.

The importance of prompt tracheotomy in these cases of nondiphtheritic obstructive laryngitis is, in my opinion, thoroughly established. Not only does it insure a proper airway and put the inflamed larynx at rest but it permits repeated drainage of the profuse tracheal secretions that frequently complicate many of these cases and thereby constitute a continued source of danger from low obstruction for several days. This is particularly true in severe cases of acute laryngotracheobronchitis in which an accumulation of thick tenacious jelly-like secretions in the tracheobronchial tree inevitably proves fatal unless repeated efforts at removal by suction or even bronchoscopic methods succeed in preventing asphyxia. Certain of these cases are especially fulminating, and, in spite of prompt tracheotomy, repeated suction cleaning of the tracheobronchial tree, and supportive measures—such as oxygen, transfusions, and infusions—they rapidly progress to a fatal termination. It is hoped that chemotherapy may, if instituted promptly, help in this desperate situation. The following case reports illustrate first, a typical fulminating infection ending fatally in spite of all efforts, and, second, 2 severe infections with successful outcome.

R. R., aged 1½ years, was admitted to Strong Memorial Hospital on December 19, 1939. The patient was well until two days before admission, at which time hoarseness was noted and he was thought to be developing a simple cold. Hoarseness and irritative cough continued in spite of inhalations. The possibility of a foreign body was considered, and, although an x-ray examination was entirely negative, he was sent to the hospital for study. Examination showed a mildly ill infant with slight fever. The pharynx was moderately hyperemic. A wheezy inspira-

take the form of a congenital hyperplastic redundancy of the subglottic tissues, a subglottic diaphragm, or actual tumor formation. The following case history illustrates such an instance.

R. C., a boy aged $2\frac{1}{2}$ months, was admitted to the hospital with a diagnosis of probable thymic enlargement. Stridor was noted shortly after birth, and there had been periods of actual dyspnea. About two weeks before admission breathing became increasingly labored, and for the preceding twenty-four hours the dyspnea had become alarming, with periods of marked cyanosis.

Examination showed a fairly well-developed infant in marked respiratory distress, with both inspiratory and expiratory stridor. The chest was clear clinically, and neither fluoroscopic nor roentgen study showed any abnormality in the chest, neck, or mediastinum. The child was placed in a croup tent, but the evident progression of signs of obstruction necessitated tracheotomy a few hours later. This promptly relieved the dyspnea. After a few days of rest direct laryngoscopic examination was performed. The epiglottis and laryngeal structures were normal. About 1 cm. below the left vocal cord, however, a large mass was discovered protruding from the posterior wall of the subglottic tissues. The mass was firm on probing and was large enough to prevent the passage of a 3-mm. bronchoscope. It was removed by biting forceps, the work being done through a 5-mm. tracheoscope in order to separate and protect the vocal cords. A second inspection five days later showed that a small remnant persisted, and this was satisfactorily removed. Decannulation was possible ten days later, and the child was discharged from the hospital shortly afterward. No subsequent respiratory difficulty has been noted. The biopsy report was as follows: "Section reveals a polyp-like structure formed of dense fibrous tissue covered with pseudostratified columnar epithelium and containing many small glands."

Conclusion

The management of both acute and chronic disorders of the larynx in infancy and childhood presents many problems of unusual difficulty. It is hoped that this report will emphasize the necessity for careful direct examination of the larynx so that differential rather than inferential methods of diagnosis may be more generally employed.

Discussion

Dr. Marvin F. Jones, *New York City*—The ear, nose, and throat conditions of children consist of a specialty within a specialty. Until comparatively recently the study of those conditions peculiar to children has been somewhat neglected. Dr. Heatly's paper again accentuates the importance of a study that will result in more intelligent means of treating a child before he has reached the cooperative age.

The problems concerned are not only the various diseases to which these children are exposed but also the attitude of the parents. Sometimes it is most difficult to obtain the whole-hearted cooperation that makes effective therapy possible. Our attitude toward croupy manifestations in children has been principally directed toward the justly alarmed parents. It is most difficult in this situation to advise the procedures that are necessary for eventual cures. The attitude of the attending pediatrician can be of great help. Perhaps the surest approach to a solution of the problem is first to convince the pediatrician of the rationale of the procedures we propose to use.

In more recent years and, specifically, the last two years, I have had more unusual laryngeal manifestations in children called to my attention than ever before. The first, I believe, was about a year ago, when Dr. Brancato, of Paterson, told me of an apparent epidemic of alarming laryngeal stridors. More recently, Dr. Reynolds has called to my attention the frequency of occurrence of the *Staphylococcus hemolyticus* as an upper respiratory infection in children and has also mentioned the peculiar chest pathology that accompanies or follows these attacks. It seems to be a *staphylococcus* of more virulence than we have been accustomed to see. The laryngotracheobronchitis, which we have always considered a serious situation, apparently is now of more frequent occurrence. This seems to be not only the case in New York but has also been observed in at least one state in the Middle West. Bronchology has offered a lifesaving aid for some of these patients, and chemotherapy has evidently aided to some degree—as yet unknown.

The common error is mistaking a laryngeal diphtheria for these less specific cases. Diphtheria antitoxin has been used in some cases without result.

It is fortunate that a paper such as Dr. Heatly's should be read before the society, since this phase of his subject is, in my opinion, increasing rather than diminishing at the present time.

Dr. Thomas G. Tickle, *New York City*—Dr. Heatly has covered his subject so well that I can merely emphasize some of the points that he has brought out.

the tracheotomy tube stimulate the cough reflex and aid materially in the effectiveness of the suction treatments. The value of postural irrigation of the tracheobronchial tree, as suggested by Galloway,³ is fully corroborated in the second case reported and should, in my opinion be tried in the more severe cases.

The Chronic Larynx

The larynx in infancy may be the seat of a variety of disorders of chronic nature which manifest themselves by varying degrees of stridor, hoarseness, or obstructive dyspnea. Inferential methods of diagnosis are here, unfortunately, common, usually erroneous, and always deplorable. The safety of the patient requires a complete physical examination, fluoroscopic and roentgen studies of the neck, chest, and mediastinum, and above all a careful direct study of the larynx without anesthesia. There is still a common tendency to attribute many of these disorders to thymic origin because of an enlarged shadow reported in the fluoroscopic or roentgen examination without direct inspection to exclude a laryngeal cause. In a series of 20 cases encountered by me over an eleven-year period, such a diagnosis had previously been made in 11 patients, and only the failure of roentgen therapy to influence the symptoms was responsible for further study. In a series of 15 cases of chronic stridor reported by Kennedy and New⁴ in 1931, a diagnosis of enlarged thymus had previously been made in 9, and in only 1 instance was a thymic origin finally established and thus a tumor rather than a simple hypertrophy. It is an important clinical fact that in the hands of many roentgenologists the roentgenogram does not give a true picture of the size of the thymus gland. Hasley and De Tomasi,⁵ by cinex camera studies, have demonstrated that the size of the thymic shadow varies not only with the phase of respiration but also with the phase of the cardiac cycle. Careful fluoroscopic studies from both the anteroposterior and the lateral positions are necessary to the recognition of these variations. It is imperative in the presence of persistent stridor, hoarseness, or dyspnea in infancy that the final diagnosis be withheld until careful direct inspection of the larynx has been completed. Such an examination is particularly indicated whenever roentgen treatment of an apparent enlargement in the superior mediastinum has not resulted in prompt relief of symptoms.

In the series of 20 cases that I have encountered,⁶ the final diagnosis was as follows

congenital laryngeal stridor, 12 cases, paralysis of the vocal cord, 2, tumor of the larynx, 1, congenital web, 1, subglottic tumor, 1, subglottic stenosis, 1, tumor of the mediastinum, 1, congenital anomaly of the ligamentous attachments of the sternum, 1, total, 20.

As will be observed from this study, the commonest cause of chronic stridor in infancy is the soft, flabby type of larynx with an elongated or broadened epiglottis and flaccid aryepiglottic folds. This condition of exaggerated infantile characteristics is clinically known as congenital laryngeal stridor and, except for occasional fatality from acute intercurrent infections of the respiratory tract, regularly improves during the second year with the normal growth of the larynx. Paralysis of one or both vocal cords in infancy is a frequently overlooked cause of stridor or hoarseness. Gradual improvement usually occurs. Many cases of fatal asphyxia neonatorum undoubtedly result from an unrecognized bilateral cord palsy. Prolonged, difficult labor with accompanying instrumentation may injure not only the recurrent nerves but also the cricoarytenoid joints with resulting fixation or dislocation of the arytenoid cartilages. Laryngeal paralysis of central origin has also been reported, resulting from intracranial hemorrhage incident to difficult labor. One of the cases in my own series was of this variety. The commonest tumor encountered in infancy is the papilloma that may be congenital and is characteristically multiple and recurrent. Angiomas and cysts have also been observed. Congenital webs are occasionally encountered in the form of a membrane uniting the vocal cords at the anterior commissure and extending backward for a variable distance to a crescentic margin. These webs are caused by an arrested separation of the fusion which normally obliterates the primitive glottis during the middle of the second month of fetal life. Structurally they consist of a wedge-shaped mass of tissue and may contain connective tissue, muscle fibers, rudimentary glands, and occasionally cartilage. Simple incision or excision is usually followed by prompt recurrence with troublesome adhesions so that special procedures have been evolved to facilitate the management of this interesting condition. The congenital web must be carefully differentiated from an acquired diaphragm or false web resulting from injury or ulceration of the laryngeal mucosa. Chronic stridor and dyspnea in infancy may occasionally result from an obstruction in the subglottic area. This may

Case Report

PRIMARY LYMPHOSARCOMA OF THE TONSIL

N P Cosco, M D, and H F POHLMANN, M D, F A C S, Middletown, New York

THE importance of taking biopsies in every suspicious lesion is well exemplified by the following case in which the initial symptom was not particularly severe and the physical findings are not too unusual.

Case Report

J H W, a white man, aged 54, fire-truck driver, weight 159, was seen on February 21, 1939, because of "rawness in throat," of forty-eight hours' duration, following fighting an all-night fire. Temperature, pulse, and respiration were normal. The physical examination was essentially negative, except for small, shotty, cervical glands, a diffusely reddened throat, and a moderately enlarged right tonsil. He was given a gargle and some lozenges and told to return if the symptoms persisted. On February 24, 1939, he returned with the same symptoms and the same signs, without the diffuse redness previously noted. At that time, under local anesthesia, a biopsy was taken from the right tonsil with a scalpel diathermy in the office. This was reported by the State Institute for the Study of Malignant Disease at Buffalo, as "lymphosarcoma of the tonsil" (Fig 1). Wassermann was negative. Blood and urine were not unusual.

On March 1, 1939, three radon seeds were implanted at the base of the tonsil in the form of a triangle. This was done under local anesthesia in the office. X-ray therapy was instituted by Dr J Walton at the Horton Memorial Hospital, Middletown, New York, on March 4, 1939. The seeds were removed on March 10, 1939. Therapy, in all, consisted of 1,000 millicurie hours gamma radiation and 3,220 r distributed over four fields with one field directed from the opposite side. He was last seen on February 19, 1941. He feels fine and weighs 153 pounds. The tonsil is practically obliterated, and no cervical glands can be felt.

Discussion

This case when first seen appeared to be one of those ordinary run-of-the-mill cases often seen in office practice. Nothing about its appearance would lead one to suspect malignancy. Yet, somehow it did not seem "quite right," and, for that reason only, a biopsy was done. Both procedures—biopsy and implantation of radium—were done without difficulty under local anesthesia in the office. The end results were exceedingly gratifying. The case serves to stress the fact that malignancy must always be suspected, however trivial the initial complaint.

Once suspected, there should be no hesitancy in taking a biopsy.

Summary

1 A case of primary lymphosarcoma of the tonsil is presented.

2 The initial complaint was "rawness in the throat."

3 All the necessary diagnostic work and radium implantation was done in the office without difficulty and without additional expense to the patient.

4. The importance of suspecting malignancy of the tonsil and of taking tonsillar biopsies is stressed.

Acknowledgment is made to the State Institute for the Study of Malignant Disease, Buffalo, to Dr David Satenstein of the New York Skin and Cancer Unit, and to the Photographic Department of the New York Post-Graduate Hospital for kind cooperation in making the photomicrograph possible.

29 Railroad Avenue

FIG 1 Photomicrograph of biopsy reported by State Institute as lymphosarcoma of tonsil

Organized medicine in Meeker County, Minnesota, has started a campaign to eliminate all tuberculosis in the county.

In the University of Minnesota Student Health Service every new student is given a comprehensive medical examination.

Because of the soft structures and the normally small larynges, only those doing endoscopic work can realize the difficulties one encounters and how easily one can cause an edema of the larynx.

I agree with Dr Heatly that when called to see an infant with an acute involvement of the larynx it is most important to obtain a complete history—when the symptoms began—always bearing in mind the possibility of a foreign body in the larynx

Persistent questioning helps parents to recall a possible instance of choking and gagging while the child had food or some unknown substance in its mouth.

A routine examination should be followed in these cases, including x-rays—anteroposterior and lateral—from the ears to the hips

G P, aged 3, was playing on the floor. She started to cry and appeared to have some difficulty in swallowing. She was taken to a hospital where the roentgenologist took films of the chest and abdomen and from the chin up. When read, nothing unusual was observed, so the parents were told that their child "had swallowed nothing." However, the symptoms continued, and, five days later when films were taken from the ears to the hips, an open safety pin was observed in the larynx. After its removal, the baby recovered.

A retropharyngeal abscess in an infant requires skillful care, especially when inserting a tongue depressor for examination, as in some cases the pressure of the tongue has closed the epiglottis, thus causing death.

A method of evacuating the pus which has proved successful is that of attaching an antrum cannula to a tube connected with a suction bottle, inserting the cannula into the abscess, and aspirating the contents, after which the abscess can be incised and drained, thereby preventing the apration of pus into the lungs.

In infants with a laryngeal obstruction—the symptoms of which are retraction of the supraclavicular, infraclavicular, and intercostal spaces, restlessness, choking, and ashen color of face—a paralysis of the respiratory center will result, and one should never wait for a cyanosis before doing a tracheotomy.

Recently, a greater number of infants and children have been seen with laryngotracheitis, and in these cases an early tracheotomy is indicated.

One should remember that these younger patients breathe better in a sitting position, often when placed in a reclining position for a tracheotomy they cease to breathe. Consequently, if there is marked dyspnea, a tracheotomy should be performed with the patient in a sitting position.

A frequently-asked question is: When is it safe to remove the tracheotomy tube?

Not until the tube has been plugged one-half of the way, then three-quarters of the way, and, lastly, after it has been plugged for forty-eight hours. (Never use an ordinary cork for plugging, it becomes friable and is liable to crumble and become inhaled into the lung. Use an orangewood stick or a rubber cork for plugging.)

I agree with Dr Heatly that no sedative such as opium should be given to children. I would hesitate to irrigate the lungs, much preferring to place the child in a steam bath and give it soda bicarbonate by mouth to liquefy the secretions.

Many cases of chronic larynx have been attributed to an enlarged thymus. After having been connected with a hospital where a large number of adenoid and tonsil operations have been performed, I believe that this condition is difficult to diagnose, the diagnosis depending largely on the roentgenologist.

Few cases of congenital webs are seen, and the known treatment is unsatisfactory.

MANKIND'S DEBT TO MEDICINE

There is not an area of human life or interest to which medicine has not made its contribution. Into literature and representative and plastic art, into music and mathematics, physical and biologic science, psychology and social science, and philosophy and theology, into our daily living, into our homes and business, and into our leisure and recreations, medicine has entered, not as an interloper but as an interpreter, not as a servant but as a teacher. From the moment of our first rising in the morning until the moment of our last conscious thought in the evening, medicine has in some way modified and sculptured our lives. Our diet and our dress, our work and our play, our thought and our prayer even, our rest and our travel have been influenced in the world in which we live today, whether it is amidst the thundering tanks of an attack or amidst the peace of Angelus-time in the countryside, whether it is amidst the stench of exploding bombs or among the sweetly floating perfumes of the summer flowers. In all of

these, medicine has had its part in molding the daily régime that brings peace or turmoil, worry or joy, to the last and least of us.

It would not be in place to review here the recent findings of anatomy and physiology, of pharmacology and pathology, of clinical medicine and surgery, and of the constantly increasing number of specialties to prove my point. Suffice it to say that from the moment of conception, and even before, until the grave we are with each breath through which our life is prolonged increasing the debt which we owe to the science and art which the first of the encyclopedists, Isador of Seville, pronounced to be the "synthesis of all the sciences and all the arts," because it concerned itself with that most valuable creature in God's creation, the human being.—Alphonse M. Schwittalla, S.J., Dean, St. Louis University School of Medicine, address before the eighteenth annual meeting of the Woman's Auxiliary to the American Medical Association held at New York, June 10-14, 1940.

lapsed into coma. The dressing was again soaked with thin brownish material. A profuse involuntary fecal discharge from the wound occurred and was liquid in nature and brownish black in color. The patient expired the same day.

To summarize we can say that the patient was admitted for treatment of painless jaundice of three weeks' duration. A cholecystogastrostomy was performed in the presence of an enlarged cystic and common bile duct on the second day of hospitalization. Vitamin K and bile salt therapy had been given over a period of five days before operation. Although there was no increase in temperature, pulse, and respiratory rates, the postoperative course was complicated by the following: (1) failure of the jaundice to clear, (2) hemorrhage from the incision, and (3) profuse drainage of bile from the wound. The patient slowly weakened and, despite supportive measures, died on the fifteenth postoperative day.

Discussion

DR. ROBERT B. LOBBAN: The most significant points are the painless jaundice of three weeks' duration and the palpable gallbladder. The rest of the history was essentially negative. I felt we were dealing with an obstruction somewhere between the opening of the cystic duct and the duodenum. This is often due to carcinoma of the head of the pancreas and was the first possibility entertained. The second was carcinoma involving the ampulla of Vater. A third possibility was a silent stone in the common duct. Inasmuch as this patient was afebrile and the white and differential counts were normal, we did not expect to find a stone in the common duct. The fourth possibility was obstruction due to extrinsic pressure on the common duct. At operation it was established that the mass palpated in the right upper quadrant was the gallbladder. It was found to be tremendously distended, as were the cystic and common ducts. We could not feel a stone in the common duct. Palpation of the common duct down to and including the ampulla of Vater and the duodenum failed to reveal a mass. Four or five edematous glands were found in the gastrohepatic ligament. These were soft and mushy, did not obstruct the common duct, and gave no appearance of malignancy. The head of the pancreas was enlarged and felt somewhat constricted and shotty. It was, however, considered to be normal at this time. This reduced the possibilities to something in the

duct itself. At times a common duct is opened without finding anything, except "mud," which can give jaundice and pain.

Therefore, in this case the common duct was opened. Through this opening a probe was easily passed through the ampulla of Vater, and the end of it could be felt in the duodenum. The bile in the common duct was perfectly clear. We still did not know what caused the jaundice in this individual. The head of the pancreas was not characteristic of carcinoma, and when the probe was in place I palpated for the possibility of carcinoma in the duct itself. Even though no obstruction was found to account for the jaundice, a T tube was placed in the common duct for temporary drainage. A biopsy of one of the glands in the gastrohepatic ligament was taken. The patient had a slight temperature elevation on the second and third day after operation, but from then on it was approximately 100 F (37.8 C) during the entire postoperative course.

Drainage of bile through the T tube was adequate for nine days. At that time she started to leak bile around the T tube, and apparently there was a breakdown of the cholecystogastrostomy. From this time on the course was progressively downhill.

DR. WRIGHT: Dr. Carter has come to discuss this problem from the standpoint of differential diagnosis and clinical course. There are two questions that I would like to have discussed. First, is it not rather unusual for diarrhea to be a symptom associated with retention of bile? Second, why was there no decrease in the jaundice despite adequate drainage of bile from the tube?

DR. R. FRANKLIN CARTER: My answer to Dr. Wright is that diarrhea is not a common symptom associated with obstructive jaundice. It is possible that the pancreatic juice was being sidetracked back into the biliary system by whatever obstruction existed, and this insufficiency of pancreatic juice may have caused the diarrhea in this case. We do not understand why the course of the jaundice is not occasionally influenced by external drainage. We have had several patients who have acted the same way as this one. We followed 1 case for two and one-half months, and the striking thing was that the bilirubin of the bile was normal though there were no bile salts, cholesterol, or pancreatic ferments present. A possible explanation for the failure of the jaundice to clear after external drainage would be the presence of hepatic insufficiency due to cirrhosis or hepatitis.

Diagnosis

THIS new JOURNAL section carries case reports that have been made the subject of discussion from the point of view of the diagnostic process needed and the post-mortem evidence. All the cases are selected because of some unusual interest. Two hospitals in this city supply this material, each six times a year. Reports from the New York Post-Graduate Hospital alternate with reports from Bellevue Hospital, Fourth Medical Division.

CLINICOPATHOLOGICAL CONFERENCES

NEW YORK POST-GRADUATE MEDICAL SCHOOL AND HOSPITAL, COLUMBIA UNIVERSITY DEPARTMENTS OF MEDICINE AND PATHOLOGY

Date December 17, 1940

Presiding Dr Irving S. Wright

History

DR MAURICE BRUGER This patient was a white American woman, 61 years of age, who was admitted to the New York Post-Graduate Hospital complaining of generalized pruritus and painless jaundice of three weeks' duration. There had been a loss of 20 pounds in weight in the last six months. Nausea, vomiting, and related symptoms were absent. Three to four loose, light yellow stools had occurred daily for the past six months. No blood or mucus was seen. The patient denied contact with any hepatotoxic agents.

There was no history of preceding serious illnesses or operative procedures. She had two normal pregnancies and one miscarriage. Menopause occurred at 51 years of age.

On physical examination the patient appeared to be comfortable but markedly icteric. Examination of the head, neck, chest, and heart was normal. A nontender mass was felt in the right upper quadrant, the outline of which resembled the gallbladder. The spleen and liver were not felt.

Urinalysis showed a 2 plus protein and 2 plus foam test for bile. Bleeding and coagulation times were within the normal range. The serum Van den Bergh was 7.6 mg of bilirubin per hundred cubic centimeters with a strong direct positive reaction. The icteric index was 7.14. Blood glucose and urea nitrogen studies were normal.

Two days after admission a cholecystogastrostomy was performed. The operative note read as follows:

"The gallbladder was found to be dilated and under tension. The cystic duct and the common duct also appeared to be moderately dilated. Several enlarged lymph glands were found about the common duct, and one was removed for microscopic study. There were

no nodular obstructions demonstrable at the head of the pancreas. A probe was easily passed through the ampulla into the duodenum. A T tube was inserted into the common bile duct for decompression, and a cholecystogastrostomy was performed in the usual manner for permanent drainage."

The portion of the gallbladder wall which was removed to form the stoma of the cholecystogastrostomy was examined histologically and revealed papillary hyperplasia. Four pieces of black bilirubin "gravel," each about 5 mm in diameter, were found in this portion of gallbladder wall. Microscopic examination of the lymph node showed chronic lymphadenitis but no evidence of malignancy.

The patient received a transfusion of 500 cc of citrated whole blood immediately after the operation. The postoperative course remained satisfactory for eight days. On the ninth postoperative day the patient complained for the first time of severe pain and cramplike sensations in the abdomen. Vomiting occurred on one occasion. A large amount of drainage occurred about the T tube. Temperature was 100 F (37.8 C), pulse rate, 104, and the respiratory rate, 18. The clinical impressions at this time were (1) that a slough of the cholecystogastrostomy had occurred with the formation of a fistula and (2) that peritonitis had set in.

On the following day the dressing was found to be saturated with brownish material characteristic of high intestinal or stomach contents. The abdomen, however, appeared soft. On the tenth postoperative day the skin about the tube appeared irritated but the secretion on the dressing was now less marked. Temperature, pulse, and respiratory rates were normal. On the thirteenth postoperative day a considerable amount of drainage which appeared bloody was found oozing around the T tube. On the fifteenth postoperative day the patient complained of epigastric pain and

tumor The distal end being turned in, the proximal end is either anastomosed to the jejunum or is also turned in and a gastroenterostomy performed

I personally feel that the first stage of the operation carries with it a great risk and that a simpler procedure should be performed—such as a simple cholecystostomy with only enough exploration to rule out stones in the common duct and to determine the extent of malignancy Then, after the jaundice is completely clear a one-stage operation may be carried out, implanting the common duct into the jejunum, excising the tumor area, and then doing a gastrojejunostomy

DR. WRIGHT What is the mortality rate in this type of procedure? Is carcinoma of the ampulla of Vater particularly malignant?

DR. LOBBAN Without operation the prognosis is nil and the patients usually die within six months Palliative operation, consisting of anastomosis of the gallbladder with the stomach, duodenum, or jejunum, will probably prolong the patient's life, and there have been cases reported in which the patients have lived three or four years The mortality of this procedure is probably 20 per cent The mortality of the radical operation consisting of two stages will run approximately 40 per cent The complications in the unoperated cases are usually either massive hemorrhage from the ulcerated area in the duodenum, general bleeding due to the extreme jaundice, or ascending suppurative cholangitis with associated hepatic insufficiency Complications in the operative group may be peritonitis or hepatic insufficiency Most observers report that carcinomas of the ampulla of Vater are relatively slow to grow and to metastasize

Pathology

DR. MAURICE N. RICHTER The principal lesion in this case was not particularly easy to demonstrate at the time of the autopsy The only thing observed at the site of the ampulla was that it seemed a little more prominent than usual It projected into the lumen of the duodenum When we sectioned the ampulla, the tissues themselves were a little firmer and a little grayer than usual The liver was enlarged and jaundiced In the region of the operation there was a small amount of brown material and pus Terminal infection in the peritoneal cavity was present I do not understand the bleeding, because no blood was found in the gallbladder or in the ducts and the feces were light brown

rather than black or bloody The pancreas showed no changes of interest, and the pancreatic duct opened separately from the common bile duct Histologic examination of the ampulla showed an atypical epithelial growth infiltrating the tissues. There was a strong tendency for it to form glandlike areas, and thus it should be called an adenocarcinoma There was no infiltration in the duodenum itself No metastases were observed The liver showed changes merely of biliary obstruction, and there was a considerable amount of liver degeneration Some of the small bile canaliculi had bile in their lumens

This case illustrates the type of carcinoma that causes marked interference with function, not because it is histologically malignant but because of its position As far as tumors of the ampulla of Vater are concerned, six possibilities regarding the site of their origin are mentioned in the literature In the great majority of cases it is impossible to differentiate between the six different types The main difference is in their form, some being papillary and others being more solid and ulcerative

Recent authors have brought out the fact that blood in the stools is the only factor that will differentiate a carcinoma of the ampulla of Vater from other types of obstruction to the common duct¹ The tumor in this case was not the type that would produce bleeding, and so the finding of blood would not have helped us much There was no fibrosis in the pancreas or evidence of obstruction in the pancreatic duct I do not believe we can blame the diarrhea on pancreatic obstruction

Pathologic Diagnosis

Adenocarcinoma of the ampulla of Vater

DR. BENJAMIN SILBERG What was the cause of death?

DR. RICHTER There was localized peritonitis with pus under the right dome of the diaphragm

DR. FERDINAND G. KOJIS Can you explain the fecal discharge?

DR. RICHTER No

DR. WRIGHT How did the fecal material get into the peritoneal cavity?

DR. RICHTER We could not demonstrate a fistula The exact point of leakage was not seen

DR. CARTER I would like to ask if it is possible to diagnose these cases before op-

¹ Cooper, W. A. *Ann. Surg.* 106: 1009 (Dec.) 1937

I think it is difficult to show obstruction of the common duct with a probe at operation as well as at autopsy. We have recently seen a patient on whom a cholecystectomy was performed, and at operation no evidence of common duct obstruction was found. However, when hippuran was introduced into the duct under a pressure of 10 cm of water, none entered the duodenum. The present case may have had enough of an obstruction to prevent the flow of bile under physiologic conditions but not sufficient to be discovered at operation. When surgeons examine for common duct obstruction at operation, they tend to use much greater pressure than is exerted by bile under normal conditions.

DR WRIGHT: The administration of bile salts and vitamin K to jaundiced patients should be discussed.

DR BRUGER: Bile salts must be administered routinely when vitamin K is given, since, in the absence of bile, absorption of vitamin K from the gastrointestinal tract is questionable. Bile salts are given by mouth in doses of 0.5 to 1 Gm three times a day. Vitamin K may be administered by the same route in its natural form or as the synthetic compound 2-methyl-1,4 naphthoquinone in doses of 2 to 4 mg daily. A prothrombin time should be done prior to surgery, and operation should be performed only when this is within normal limits.

DR WRIGHT: I think we should consider whether anything would have been gained by more complete preoperative work-up.

DR LOBBAN: With the T tube in place we planned to inject some hippuran and find out what was causing the obstruction in the ampulla of Vater. The patient's progress was good, and this was to be done at the end of the first week. However, at that time there was evidence of sloughing of the cholecystogastrostomy, and thus the possibility of getting a good picture was poor. We might have attempted a duodenal drainage preoperatively, but, because the patient's icteric index rose rapidly to 71.4 and since her stools were acholic, this was not done. Diarrhea had been present for six months prior to her jaundice. The stools were watery or semi-formed, averaging three to four a day. No blood, pus, or protozoa were found on repeated examinations. For these reasons no gastrointestinal x-rays were taken.

DR RICHTER: Dr Lobban mentioned several possibilities for clinical diagnoses, then, at operation proceeded to rule them out. That leaves us without a clinical diagno-

sis. It might be interesting to know what might have been done further if the patient had lived longer.

DR WRIGHT: Dr Lobban, what was your diagnosis after the operation?

DR LOBBAN: Carcinoma of the ampulla of Vater. This was my impression despite the fact that I could not palpate it and that the probe went through the sphincter without meeting any resistance. I was under the impression that I was pushing the carcinoma forward with the probe. I know of a patient who went to his physician because of gastric pain and was told to have gastrointestinal x-rays taken. These were negative for an alimentary neoplasm. Following the x-ray studies his physician noted the development of icterus which lasted about five weeks before disappearing. Jaundice recurred in four weeks, and the icteric index rose to 180. I saw him at that time and admitted him to the hospital. At operation I found a small tumor of the ampulla of Vater which was freely movable with the duodenum at that point. Inasmuch as the probe went through the sphincter in the present case, I thought there might be a movable carcinoma at the head of the probe and did a cholecystogastrostomy to give her permanent drainage.

DR WRIGHT: In carcinoma of the ampulla of Vater do you expect to find anything in the gastrointestinal x-rays?

DR LOBBAN: Not necessarily.

DR WRIGHT: Is there a satisfactory surgical procedure for removal of carcinoma of the ampulla of Vater?

DR LOBBAN: The operation is usually divided into two stages. The first stage consists of short-circuiting the bile by way of the gallbladder to the stomach, duodenum, or jejunum. Some go further and perform a gastroenterostomy with ligation of the common duct below the junction of the cystic duct. The procedure that I have used consists of an anastomosis between the gallbladder and the jejunum using a relatively long loop. An enteroenterostomy is also performed to short-circuit the jejunal contents below the anastomosis in the gallbladder. It was demonstrated in this case that regurgitation of gastric contents can proceed through the gallbladder down into the common duct if the occlusion of the duct is not complete. Ascending cholangitis is a definite factor in any anastomosis between the gallbladder and the intestinal tract. The second stage consists of division of the duodenum both above and below the tumor area with resection of the

Medical Relief

Joint Statement

*From the New York State Department of Social Welfare
and the Medical Society of the State of New York*

ON the following pages the outline of "Principles and Discussion" represents the position taken by the State Department of Social Welfare (under the Public Welfare Law) in regard to the various medical welfare policies adopted by the House of Delegates of the Medical Society of the State of New York during the past several years. Also included is an outline of Basic Principles of a New Medical Plan, approved by the State Department of Social Welfare, which is now being put into effect by the State Department in various localities. This is the Medical Plan referred to in the discussion below.

The reader is requested to study thoroughly all this material and preserve these pages for future reference.

For the purpose of maintaining orderly, practical, and logical thinking on the subject of medical welfare policies, the following points must be kept in mind. Under the Public Welfare Law, local welfare officials are empowered to provide medical care on a salary basis or on a fee-for-service basis, consequently the indigent patient may not have or may have the right of free choice of physician according to the procedure adopted in any given locality. In addition, if they are to receive reimbursement from the state, their local welfare departments must be operated under the Rules and Regulations promulgated by the State Department of Social Welfare. At present there is no relation between the Workmen's Compensation panel and the care of indigent patients except in a few localities where such a relation has been mutually agreed upon on a trial basis. Any platform adopted by the State Medical Society, or by local medical groups, has no force whatever in effecting the conduct of medical relief work unless agreement can be reached with the state and local departments of welfare concerning this platform. Such agreements, if reached, are essentially mutual understandings and in no sense abrogate any portion of the Public Welfare Law. It should be noted further that the local welfare official is legally responsible, to his community and to the state, for the entire conduct of his department and he can neither delegate nor share this responsibility. He can seek and accept advice or suggestions concerning medical problems

and procedures, but in the final analysis responsibility for all decisions rests solely on him.

In studying the "Principles and Discussion" it will be noted that there is already a considerable amount of agreement on Principles 1, 2, 3, 4, and 7, some of the details of which have to be further worked out from the standpoint of statewide policies. The following portions of the discussion of these principles might well be emphasized. The State Department of Social Welfare agrees that there are advantages in the establishment of a medical advisory committee in each public welfare district and agrees to advocate the use of these committees and to assist in a general determination of their functions. Under the Public Welfare Law, these committees can advise and suggest, and can recommend policies for supervision and administration, but the responsibility for all acts and decisions must remain—and we feel should remain—in the hands of the local welfare official. State reimbursement on a local fee schedule is conditioned upon the State Department's approval of this schedule as being reasonable for the particular community rather than on the basis of a statewide fee schedule. Abolition of the system wherein medical questions are submitted to the State Department for decision is brought about automatically through the introduction of the new medical plan and the "prior authorization" system is transferred to the local agency under local professional control. Considerable study is now being given to the question of medicines and drugs—a few localities having reached a fairly satisfactory solution of this problem—and it can be expected that with local assistance much of the difficulty and criticism will be eventually eliminated. The State Department points out that under the law it cannot guarantee free choice of physician but draws attention to the fact that while in some localities it has been long-standing practice to employ salaried doctors, introduction of the new medical plan has had a tendency to increase consideration of the use of the fee-for-service basis, since provision is made for local medical controls.

Although on the surface there appears to be a wide divergence of opinion concerning

eration or at operation Would a cholangiogram be of help in making a diagnosis?

DR RICHTER I think that is a question for the roentgenologist I do not think it would have been possible in this case A number of cases have been reported with a diagnosis made preoperatively In these other cases the duodenum was dilated The duodenum was not dilated in this case

DR CARTER Would I be justified in curetting the tissue of the ampulla through the common duct for frozen section study?

DR RICHTER In this case and in most of the others we are dealing with an adenocarcinoma, and I think that if the proper specimen could be obtained a diagnosis could be made How much difference is there between this procedure and a resection?

DR CARTER There is quite a difference

between using a curet and doing a resection

DR LOBBAN What was the diagnosis at the autopsy table?

DR RICHTER The true diagnosis was not made at the autopsy table It was made in the laboratory when the sections were examined

DR LOBBAN If I had looked at the ampulla could I have made a diagnosis?

DR RICHTER The ampulla would have been unusually prominent and you would have been suspicious

BETTER HEALTH TO REWARD THE DRAFTEES

Improvement in the health of the young men called to military service should result from their period of training, avers Dr Benjamin W Black, president of the American Hospital Association in the *Kiwanis Magazine* For example, a majority of the young men will be better nourished than they were before their military service, because their food will have contained more nearly proper proportions and will be adequate in other vital respects The appetite will improve as the men experience, possibly for the first time in their lives, active physical work and exercise This combined with healthy recreation will prove of great benefit For the first time in the lives of many, regular living habits will replace a much different manner of living and the results will be substantially an indirect benefit to their health

Vaccination against smallpox is generally practiced in the military services, and because of the practice there is no smallpox in the service For those men who have not before been vaccinated or who come from areas where there had been effective agitation against it, vaccination will prove of value from the immediate protection given, but the influence of those men who are protected will prove of value in many home communities as their influence extends, even to their families and the neighborhood After the World War the death rate from typhoid fever in this country dropped very sharply and

was largely attributed to the inoculation against this disease which the men in the army were given It was almost a miracle that practically no typhoid was prevalent in the army even though it occupied a highly infested territory in Europe where typhoid would have been very prevalent had inoculation not been universal as a method of protecting the men from the disease.

Pneumonia complicated many minor communicable diseases such as measles and chicken pox, from which many of the men suffered Its severe effects resulted in a rather high death rate, but now it will be expected to lose many of its severe effects, as there have been more recently developed new methods of combating this terror The mortality from pneumonia has been greatly reduced by the use of sulfanilamide, sulfapyridine, and other allied chemicals, and by the use of serums in selected cases. The mortality from epidemic cerebrospinal meningitis in the new army will be much lower because of the discovery of these new drugs which have proved most effective against this devastating disease

In the event that blood transfusions are required to treat men ill or wounded, better results, or as good, are accomplished by the use of blood plasma It is strange but war is making its contribution to better medicine and war has been responsible for the development of new lifesaving technic

PUBLIC NOT MADLY ENTHUSIASTIC

Discussing programs for providing medical care which are being tried out by various state medical societies, the *Journal of the American Medical Association* for February 1 says that "One difficulty seems to be common to all these

plans The public is not particularly enthusiastic about prepayment for medical service There is no evidence that the citizens of this country are yearning for any universal compulsory system "

Welfare Law and the regulations of the State Department of Social Welfare make it possible for the indigent patient to choose his own physician and the physician to treat his own patients with payment for his services supplied from public funds. Although the local public welfare official is responsible for providing necessary medical care for indigent persons, the determination as to the medical needs is now

by law "made with the advice of a physician"

JACKSON DAVIS, M D

Chief Medical Officer,
State Department of Social Welfare

CHRISTOPHER WOOD, M D

Chairman,
Subcommittee on Medical Relief
Medical Society of the State of New York

Local Medical Care Plan

BASIC POLICIES

1 Recognition by public officials, physicians, hospital administrators, and all other professional personnel, of the Public Welfare Commissioner's legal responsibility and authority, within existing appropriations, to provide medical care for all persons, under its care, and for such persons otherwise able to maintain themselves, who are unable to secure necessary medical care

2 Acceptance of principle that the local Medical Program of the Department of Public Welfare should be supplementary to, and involve proper, full utilization of all existing medical facilities, federal and state, as well as local tax-supported and voluntary institutions

3 The establishment of a central unit, with administrative responsibility for the authorization and issuance of medical care, and directed by a full-time or part-time physician, who, in the discretion of public welfare official, may be supported by a Medical Advisory Committee, follows recognition of the fact that sound medical program administration requires

- a Professional medical judgment and controls such as can be given only by a physician
- b Simplified and smoothly operating procedures to effect the referral of patients to physicians for treatment
- c A clearly defined plan for keeping the social service staff informed of health, medical, and medical social treatment needs of their clients
- d An accounting system.

4 Recognition by public welfare officials and physicians, nurses, hospitals, druggists, and other professional personnel participating in the medical care program, of the value and essential need of detailed written agreements wherever practicable, stating clearly the re-

sponsibilities to be undertaken by each, as well as procedures and financial payments involved

5 Acceptance of responsibility to establish and maintain continuous medical records showing

- a Total treatment costs according to type of service, such as physician's treatment, nursing care, drugs, hospital care, appliances, etc
- b Treatment costs of individual patients
- c Diagnostic and treatment records of each individual patient
- d Administrative costs

Without such recording, no sound analysis of the value and cost of the total medical program can be made, nor can the total medical needs of the individual patients be reviewed and adequately or economically met

6 Acceptance of responsibility for joint planning and periodic case conference between the Medical Unit and the Social Service staff for utilization of physicians to determine medical need and social service to determine financial need for those patients applying to the Public Welfare Department for medical care only

7 Acceptance by the Public Welfare Official of responsibility for preparation of written statement of all medical policies and procedures, contracts, price schedules, etc, copies of which should be available to all participating professional personnel or vendors, to the social service staff, and to all cooperating agencies or institutions in any way involved in the local medical program

8 Whenever feasible, the same plan for providing medical care shall be used for all categories of public assistance in order to obviate confusion to the recipient and medical attendant, and to aid in the simplification of administrative and accounting procedures

Principles and Discussion

1 THE MEDICAL ASPECTS OF MEDICAL RELIEF SHOULD BE SUPERVISED BY THE MEDICAL PROFESSION

"Medical aspects" include

Limitation of scope of practice for individual doctors

Decision as to when specialist or consultant is necessary

Decision as to use of special clinics

Evaluation of services in terms of fees and charges

Principles 5 and 6, it can be said that the State Department now has a fairly accurate conception of the medical profession's viewpoint regarding these principles. It can be said further that the State Department is not unsympathetic toward these principles but feels that much additional thought and study are necessary, especially with reference to local conditions, before a common ground can be reached. It is entirely possible that, wherever local medical advisory committees really work and function, salaried practice and the overuse of clinics may be found to be increasingly less desirable medically, socially, and economically. This is not to say that the solution of these problems will be merely a matter of simple evolution but rather to emphasize that their solution directly depends upon the amount of thought and consideration given them.

As enumerated below, there are several methods of providing physicians' services. These methods, their costs, and the results obtained vary with the locality, to a considerable extent dependent upon the judgment and experience of the local welfare official and upon the local conditions and need with which he is confronted. However, nowhere in New York State is there a formal, functioning mechanism which integrates and correlates all the services which are provided in a community at public expense. Only by having the complete picture, especially regarding total individual costs, can the appropriating bodies, the welfare officials, and the medical care professions cooperate to the end that the medical needs of the individual and the community are met efficiently as well as economically.

To provide the services of a physician, one or more of the following methods are commonly used:

- 1 Employment of physicians on a fee-for-service basis, either giving the patient free choice of physician or limiting the choice to a selected panel of physicians
- 2 Use of public or private clinics
- 3 Employment of salaried staff physicians to treat patients in their offices and in the patient's home, with specialists' services on a fee-for-service basis
- 4 Employment of salaried staff physicians to treat patients in the patient's home, or in a clinic
- 5 Employment of salaried physicians by a city department of health for services in the home or in clinics, with or without supplementation of this service by

employment of general physicians and specialists on a fee-for-service basis when needed

- 6 By any combination of the above methods

Concerning the appointment of a physician as a medical director or medical consultant and concerning the formation of local medical advisory committees, the State Department of Social Welfare makes the following recommendations to local welfare officials:

"The attention of the local public welfare official is called to the value of securing the full cooperation of his county medical society in the development of an approved local medical program and in the selection of a competent physician to act as Medical Director or Medical Consultant on his staff. The State Department recommends that he request the medical society covering his public welfare district to submit a list of physicians recommended by the society as suitable for such appointment and meeting the requirements established by the State Board of Social Welfare, or request the medical society to comment upon the qualifications and professional standing of a licensed physician selected by him as a candidate for appointment as Medical Director or Medical Consultant. Attention is called to the value of an active professional advisory committee in providing the local public welfare official with professional advice in the development and revision of the policies included in the approved local medical program, in the arbitration and discipline of professional problems and the operation of survey boards to review and plan proper medical care for persons suffering from prolonged or disabling illnesses or presenting special or unusual medical needs. The medical advisory committee should be appointed from a list nominated for the purpose by the county medical society. Where deemed advisable this committee may be expanded in the same way to include representatives of other professions, institutions, and laymen."

In conclusion, it should again be emphasized that under the law, the welfare patient is not guaranteed the right to choose his own physician, and the physician is not guaranteed the right to treat his own patient with a commitment of payment for his services. But, if the physicians of a given locality can agree among themselves to formulate and to participate seriously in a plan adapted to the medical needs and medical and economic resources of their community, the Public

the conditions established by themselves in their own plan.

As to drugs the State Department is not as yet ready to change its regulations, especially concerning the use of proprietary drugs. The Department feels that any change in this connection can only be made after a sufficient number of medical plans have been submitted, therein indicating the opinions of the local welfare agencies and local medical groups as to what constitutes a reasonable policy in connection with special drugs and special modes of therapy. It is not likely that this determination can be made for at least another six months.

4. FREE CHOICE OF PHYSICIAN SHOULD BE GUARANTEED SUBJECT TO PROTECTIVE LIMITATIONS

As in Workmen's Compensation practice, panels of participating physicians should be established. Each physician will be bound by the scope of practice for which he has applied, subject to the approval of local authorizing boards.

Any client needing care will go to, or call, his own physician who will care for the patient under the usual conditions of private practice, except that (1) If the patient suffers from a condition outside the physician's scope of practice, he will refer the patient elsewhere, and (2) If the patient fails to qualify for medical aid through the Welfare Office, the physician will continue to treat the patient as a private patient.

Discussion

It was pointed out by the Department that in the majority of communities a system of free choice of physician on a fee-for-service basis is used by the local welfare agency. Wherever this system is used, each of the articles of this principle should be met.

However, the Department pointed out that it has neither the power under the Public Welfare Law, nor does its experience to date indicate the need, to mandate communities to the extent that they must use the fee-for-service system rather than salary or contract. It is the major responsibility of the Department to see that the scope of the program provides adequate service, of high quality at reasonable cost to the taxpayers. Wherever the local program fails to meet these requirements, the Department will insist that necessary changes be made regardless of whether the fee or salary basis is used. It is felt that for the Department to mandate one way or the other would introduce "State Medicine" to the fullest extent. It was explained that while it has been a long-standing practice in some localities to use salaried doctors, introduction of the new medical plan has had a tendency to swing communities over to the fee-for-service basis.

5. CONTRACT PRACTICE FOR MEDICAL RELIEF SHOULD BE DISAPPROVED

Contract practice is disapproved because

- 1 From the standpoint of public policy it establishes a political control over medical practice.

Establishes a type of service radically different and divorced from the private service available to the general population.

Adulterates the direct legal liability of doctor to patient, the main protection of the individual against incompetence and negligence.

Promotes pauperization of the people by its natural tendency to perpetuate political jobs and extend "free" services.

2. Medical Policy

Choice of physician, if properly controlled for protection of patient, has definite therapeutic value.

Most competent physicians will not participate in contract plan.

Tendency is to give as little care as possible because of lack of usual incentives.

Inevitable overhospitalization under contract plan makes economy an illusion.

Cheapens medical service, viewing it as a commodity.

Gives free rein to malingering, and produces growing demand for attention to trivial conditions, at the expense of adequate attention to serious conditions.

3. Ethical Policy

Directly contrary to and incompatible with the primary ethical principles that have maintained the professional status of the physician, improved the effectiveness of his service, and protected the patient against charlatanism, incompetence, and negligence.

Participation by a member of the profession compels him to violate some of these ethical provisions.

Discussion

The Department cannot agree to this principle for the reasons stated under Principle No. 4. It is quite obvious that if the Department finds the quality of care in a local community effected by and to the extent enumerated in Items 1, 2, and 3, under Principle No. 5 and these conditions traceable to the use of salary or contract doctors, the Department would in its normal supervisory role insist upon a change in the system.

6. CLINICS SHOULD NOT BE EXPLOITED TO AVOID PAYMENT OF FEES FOR SERVICE. THEY SHOULD BE USED WHEN MEDICALLY DESIRABLE

Clinics are largely staffed by private physicians receiving no remuneration for clinic services.

When ambulatory cases are sent to hospital clinics for care that could equally well, or better, be given by a private general practitioner in his office,

- (1) The clinic is unnecessarily burdened, cutting down the time available for attention to each case.
- (2) The clinic physician is unnecessarily exploited for service to public charges.
- (3) The patient is deprived of the right to be attended by his own physician.

Decision as to whether medical care is needed, or when it should cease

Decision as to drugs and appliances

"Supervision" defined

Above matters should be under *effective* control of the medical profession by

- 1 Medical society committees
- 2 Full-time medical supervisors, nominated by or approved by medical societies
- 3 County and State medical advisory boards

Actual ruling should be made by local, county or state Welfare Commissioner, but no ruling on a medical question should be made in absence of a definite recommendation by the medical board or supervising physician

Discussion

"Medical Aspects"

It was agreed that under the new medical plan the determinations as to limitation of scope of practice and use of special clinics should be made jointly by the local welfare agency and the local professional committee. It was agreed that the other decisions included in "Medical Aspects" would be made by the medical director or consultant of the local agency with or without the advice of a professional committee

"Supervision"

It was agreed that in taking cognizance of the responsibilities of a public welfare commissioner as outlined in the Public Welfare Law, the departmental medical program must be "supervised" by the commissioner and his medical director. A local medical committee should not have any supervisory or administrative *responsibility* for the program. It was agreed, however, that an "advisory medical committee" should be established in each public welfare district and that this committee should act in an advisory capacity only. It was agreed also that no ruling on a medical question should be made by a local welfare commissioner in the absence of a definite recommendation by the medical director or the medical advisory committee. The State Department of Social Welfare agrees further to advocate the use of these committees, and the exact manner in which they should function will be outlined in a document to be prepared jointly by the Department and the State Medical Society

2 ALL PHYSICIANS SHOULD BE ENCOURAGED TO PARTICIPATE IN THE SERVICE

By abolition of statewide fee schedule and substitution of local schedules, established by mutual consent of local county medical societies and local welfare officers, within limits prescribed by State Department of Social Welfare

By more liberal, but definite, provision for engagement of specialists, and consultants, when needed, in the opinion of the attending physician

By reduction of red-tape and reporting and billing mechanisms to the minimum

By complete elimination of lay interference or dictation in medical matters

Discussion

Under the new medical plan, local fee schedules are prepared by the Welfare Commissioner with the aid and cooperation of his medical director and professional advisory committee. State reimbursement is conditioned upon the State Department's approval of a local fee schedule as being reasonable for a particular community rather than on the basis of a statewide fee schedule

The exact manner and circumstances, in which specialists and consultants are to be engaged, are incorporated as part of the local medical plan. As this plan is developed jointly by the local department, the State Department and the local medical groups, it is to be expected that in each instance this policy can be handled to the satisfaction of all

Reduction of red tape has already been accomplished through the introduction of a new form which abolishes the former system of a separate bill for each patient and now permits billing on one form for all patients treated in one month

It was agreed that the State Department's requirement, that a medical director or consultant be engaged wherever the plan is put in operation, would reduce lay interference in "medical determination" to a minimum. It was pointed out, however, that the welfare commissioner is a layman who has sworn responsibilities which he may not renounce—including the authorization of welfare commitments—and that, while it is agreed that in medical matters he should have the advice and guidance of a medical director and/or committee of professional men medically competent, the responsibilities for decision must remain squarely on the shoulders of the commissioner and may in no sense be eliminated or considered as "lay interference"

3 UTMOST DECENTRALIZATION OF CONTROL IN MEDICAL MATTERS

Local supervising physicians or society boards should be able to rule on use of special drugs, use of consultants and specialists or any other special treatment, without reference of these questions to State Department of Social Welfare

Local welfare officers should have full authority to order special drugs and authorize special modes of therapy, with assurance of reimbursement to themselves, if approved by local supervising physician or society board

Discussion

Abolition of the system wherein medical questions are submitted to the State Department for decision is brought about automatically through introduction of the medical plan. It was pointed out that wherever the plan is installed and approved by the State Department the "prior authorization" system is transferred to the local agency under local professional control. Under the new system professional members of the State Department staff will periodically examine the records of local agencies to determine whether or not the agency is adhering to

Maternal Welfare

From time to time under this heading articles will appear on obstetric subjects which are deemed of importance as aids to improvement of maternal welfare in New York State. The members of the committee are Charles A. Gordon, M D, chairman, James A. Quigley, M D, and Ferdinand J. Schoeneck, M D

Infected Abortion

There can be no question that the conservative methods of handling frankly or potentially infected abortions give better results than any method that calls for active invasion of the generative tract. A few recent reports have advocated evacuation of the contents of the uterus in these cases—this practice must be condemned, since such procedure may convert a localized infection into a generalized one.

The treatment of infected abortion should include two phases—namely, supportive and medical. The recent advances in chemotherapy have greatly enhanced the handling of such cases, but we cannot depend entirely on this type of therapy to the exclusion of supportive treatment.

Patients with infected abortion should be put at absolute rest, and the head of the bed must be elevated to facilitate drainage. If the uterine contents have been passed or there is evidence that the abortion is incomplete or in progress, an ice bag should be placed over the lower abdomen and ergotrate given. It is essential that a vaginal swab culture should be taken to determine the offending organisms, and, likewise, a blood culture should be taken.

If the patient is bleeding, it is permissible to insert a vaginal speculum under strictly aseptic conditions. If the products of conception are extruding from the external os of the cervix, they may be removed with an ovum or sponge forceps and a culture taken from the cervix. However, the uterine cavity should not be invaded. If the bleeding is such as to actually endanger the patient's life, it may be necessary to insert a tight vaginal pack. This pack should be removed in twelve hours, at which time any retained products will usually be passed spontaneously.

It is advisable to start adequate sulfanilamide therapy immediately. Most of the severe infections will be found to have the beta hemolytic streptococcus as the organism involved. Sulfanilamide therapy should be continued until the culture reports are obtained. Consequent therapy will depend on the type of bacteria isolated.

If the blood, vaginal, or cervical cultures show beta hemolytic streptococci, the sulfanilamide therapy should be continued. The aim should be to keep the blood concentration of the drug as near 10 mg per hundred cubic centimeters of blood as possible. In view of the many reported complications following this type of therapy, the patient must be observed most carefully. Daily concentration determination, complete blood counts, and urinalyses are necessary during the initial active treatment. Any signs of untoward effect of the medication must be given due consideration.

If staphylococci or gonococci are isolated, sulfathiazole is indicated. Little is known as to the effect of these drugs on anaerobic organisms. If this type of bacteria or some other aerobic bacteria is found, it is probably advisable to give sulfanilamide a therapeutic trial.

The patient should receive the best possible nursing care. Proper fluid intake must be obtained by means of hypodermoclysis or the intravenous route if necessary. Unquestionably, the most important phase of the supportive treatment is repeated small blood transfusions. Every second day 250 to 300 cc of blood should be given. If the patient shows signs of definite blood loss, the initial blood transfusion should be at least 500 cc.

A word should be said about the legal aspect of these cases. If there is any question whatsoever about the abortion having been induced, the physician is obligated to report the case to the District Attorney's office. This is sometimes a rather perplexing problem, since the very character of these cases often makes such procedures embarrassing. Certainly, if the condition of the patient is such that her exodus is anticipated, the District Attorney must be notified at once, since a death-bed statement is of paramount importance in prosecuting the criminal abortionist.

Conservative handling of infected abortion, combined with proper chemotherapy and repeated small blood transfusions, will give excellent results in most of these cases.

Postgraduate Obstetric Education

Several postgraduate obstetric courses have been announced in conjunction with the statewide program of the Maternal Welfare Committee.

April 3, 1941, Syracuse, College of Medicine, Obstetric Teaching Day, District 8, Onondaga,

Oswego, Oneida, Madison, Cortland, and Cayuga counties, Dr E C Hughes, regional chairman.—At the afternoon session the speakers will be Drs. Elliott Bishop and Jesse Wallace, of Brooklyn, Dr S B Blakely, of Binghamton, and Dr M C Hatch, of Syracuse. Dr Charles Gordon,

- (4) The clinic physician or his colleague in the community is deprived of a nominal office fee which would help him pay his taxes

General cases should be sent to general practitioners in the community, especially where the patient expresses preference for a certain physician.

There is no need for a general medical clinic in the relief program

Special clinics should be used wherever a private physician wishes to refer a patient for diagnostic examination or specialized treatment

The hospital outpatient department should be used as a diagnostic center and treatment auxiliary, by the private physicians, not as a catch-all for every sort of case

Discussion

The program of the State Department of Social Welfare supplements and does not duplicate or substitute for existing facilities. The establishment, expansion, and scope of service of local clinics are determined solely by local government officials. The Department feels that where such services infringe upon or exploit the local medical group, this is a matter for arbitration between local officials and professional groups, and not subject to state interference

With the establishment of the local medical plan, the Department has no choice but to insist that existing clinics and other medical resources be used to the fullest, *reasonable* extent. The department does not, however, insist upon the use of such resources where they fail to meet the purpose for which they were established. In determining jointly with the local welfare agency the extent to which clinics

and other resources shall be used, the Department takes into consideration the quality of service, the scope of service, the physical facilities, and the ability of the clinic to handle qualitatively, as well as quantitatively, the number of cases to be referred by the local welfare agency

7 PROVISIONS SHOULD BE MADE TO ENABLE NEEDED MEDICAL CARE TO BE FURNISHED FOR INDIGENT AND NEAR INDIGENT FAMILIES NOT OTHERWISE ELIGIBLE FOR RELIEF

"Medical indigency" should be defined.

Discussion

Provision for near indigent families is made through the Public Welfare Law, Section No 85, Responsibility for Providing Medical Care. "The public welfare district shall be responsible for providing necessary medical care for all persons under its care, and for such persons, otherwise able to maintain themselves, who are unable to secure necessary medical care." L 1940, Chapter 682 modified this section by adding, "The determination as to medical care necessary for any person shall be made with the advice of a physician"

It was pointed out that in actual practice and in conformity with this section of the law, local welfare agencies make available to persons not on public assistance such medical care as is required. The medical director and medical advisory committee under the new plan can be of great assistance to the commissioner of public welfare in the interpretation of the medical needs of persons not on public assistance. Under the procedure of the State Department, reimbursement on all such medical care is granted by the department

THE LOCAL MEDICAL SOCIETY

The function of a medical society, as I see it, is to furnish a common meeting place for the discussion and interchange of knowledge and ideas among the members of our profession which should ultimately lead to the betterment of conditions of health and medical practice, through the increase in interest in and understanding of each other's problems and perplexities. This concept applies whether the gathering be a small local county group, or a national or sectional assembly such as this. When any of us attends such a meeting, our presence implies a dual role. We come to exchange ideas, to discuss problems, to give and to take, to teach and to learn. In so doing we not only stimulate our own interest and increase our own store of knowledge and effi-

ciency, but also, by our active participation, we become a teacher insofar as we stimulate our colleagues in like manner. The experience gained in preparing and presenting a paper, however simple, may stand us in good stead at some future time, and its content may furnish just the help that some professional brother was seeking to solve some problem of his own. Your local medical society can become an active, useful postgraduate school, and you a valued member of its faculty, if you will but grasp the opportunity that offers for the taking.—J M F Finney, Jr, M D, Chairman's Address, Section on Surgery, Southern Medical Association, Thirty-Fourth Annual Meeting, Louisville, November 12-16, 1940

THE GREATER AGONY

"I understand," said a friend once to a doctor, "that Green is a martyr to chronic indigestion"

"No," replied the doctor, "he has indigestion all right, but it is his wife who is the martyr"

—*Southern Medicine and Surgery*

LIMBERING UP THE ELBOW

A banker friend of a friend of ours is a victim of occasional rheumatic attacks. He was saying to an acquaintance he wished he knew how to avoid getting stiff in the joints. "Stay out of them," the other advised

—*Ill Med J*

Medical News

Albany County

Dr Clay Ray Murray, of Physicians and Surgeons, New York City, spoke on "Problem Fractures About the Elbow Joint" before the county society on February 26. Dr Foster Kennedy is scheduled to address the society in March and Dr Cary Eggleston in April.

Bronx County

The program of the county society on February 19 was as follows: (I) Executive Session, (II) "The Hospital and the Community," by Dr Frederick MacCurdy, president, New York State Hospital Association, with discussion by Mr William B Seltzer, superintendent, Bronx Hospital, and Dr Jack Masur, superintendent, Lebanon Hospital, (III) "The Present and Future Status of Private Medical Practice," by Dr Harry Projector, with discussion by Dr Milton J Goodfriend.

The topics and speakers at the meeting of the Bronx Pathological Society on February 18 were: (A) Case Presentations—(1) "Cystosarcoma Phylloides of the Breast," by Dr Herman Scholnick, and (2) "Metastatic Malignant Melanoma of the Breast (2 Cases)," by Dr Bernard Lapan, (B) Paper of the Evening—"The Pathology and Etiology of Mammary Cancer," by Dr Charles F Geschickter.

The North Bronx Medical Society met on March 6 at Elmsmere Hall and listened to the following addresses: (1) "Lymphoblastoma," by Dr Samuel Feldman, (2) "Jaundice Following Sulfanilamide Therapy," by Dr Benjamin Diamond, (3) "Toxic Adenoma of Thyroid and Prostatic Hypertrophy Treated with Radium and X-Ray," by Dr Solomon Ginsburg, (4) "(a) 'Winged' Scapula with Unusual Complications and (b) Subdeltoid Bursts," by Dr Howard Gordon, and (5) "Carotid Sinus Sensibility," by Dr Nathan Savitsky.

Chautauqua County

Medical and surgical supplies, valued at about \$3,000 and donated by members of the Jamestown Medical Society, were packed and shipped to Britain on February 13.

Approximately forty-five members of the society, as well as the Jamestown General and W C A. hospitals, joined in making contributions. All were collected within a week, Dr James M. Steele, chairman, said.

Erie County

A change in the health program of the United States is necessary for a better defense, Dr Samuel J Kopetzky, of New York, chairman of the medical preparedness committee and president-elect of the State Society, told the county society on February 17 in Hotel Statler, Buffalo, as reported in the *Buffalo Evening News*.

"The medical profession," he said, "holds key positions all over the country in determining the deficiencies of the draftees. There is a change needed for the health of the people and this doesn't mean muscularization. They aren't any good in the Army or Navy if they can't see or chew. It is up to us to reason out a health-

education program, and this must start in the primary grades.

"There is no greater concern for any government than the health and environment of its people. In such a program we need the cooperation of the associations of dentists, nutritionists, optometrists, and education."

Commending the local group's efforts in behalf of military training for Medical Reserve officers and other cooperation with Selective Service training, Dr Kopetzky said that the national Medical Association decentralized its medical preparedness committee "after sensing the trend of the legislative acts in Washington." The national group, he said, asked each state society to set up its own such committee, and this in turn was turned over to the county groups.

Upon recommendation of the medical preparedness committee of the local group, the Comitua Minora will sponsor a course of military instruction for Medical Reserve officers of this district in Alumni Hall of the University of Buffalo School of Medicine, Dr Nelson W Strohm, president, announced. Sessions will be held weekly under Lieut Col Sherlock A. Herick, executive of the Buffalo Military District, and Major Austin P Higgins. Dr Strohm said that 1,276 letters have been sent to doctors in the Buffalo area relative to the course.

Because of a disagreement between the Erie County Welfare Department and the Buffalo City Health Board on an interpretation of the State Public Welfare Law, the health board has referred the dispute to the county medical society.

Three local hospitals, Children's, General, and Meyer Memorial, are seeking payment of bills for the hospitalization of indigent persons suffering from communicable diseases. The county department contends the city is responsible for payment of the bills, and the health board, in turn, contends the responsibility for payment rests with the welfare department.

Dr Herbert H. Bauckus, health board chairman, declared the welfare department was seeking to evade its responsibility. His motion recommending the aid of the medical society was approved.

The section of pathology of the Buffalo Academy of Medicine held a joint meeting on February 26 with the Western New York branch of the National Gastroenterological Association and heard a paper on "Pathologic and Clinical Aspects of Cholecystitis," by Dr Anthony Bassler, president, National Gastroenterological Association.

On March 5 the section of surgery listened to an address on "The Importance of Restoration of Function Following Fractures of the Humerus," by Dr J Paul North, Philadelphia. On March 12 the section heard an address on "The Management of Bronchial Asthma," by Dr Harry Wilmer, Philadelphia.

Herkimer County

Dr Charles Peckham, Bassett Hospital, Cooperstown, addressed the county society on February 11, in the Mohawk Valley Country

chairman of the Maternal Welfare Committee, will give a demonstration of the functioning of the Obstetric Conference. Exhibits of colored moving pictures, the conduct of a follow-up clinic for toxic patients, and a home delivery service are planned. There will be a dinner at the Hotel Onondaga at which the speaker will be Dr W E Studdiford, New York City. A showing of a colored motion picture will follow.

April 9, 1941, Rochester, University of Rochester Medical School and Rochester Academy of Medicine, Obstetric Teaching Day, District 10, Monroe, Orleans, Wayne, Livingston, Ontario, Yates, and Seneca counties, Dr W L Ekas, regional chairman.—The program, at 3 00 P M, will be as follows: "Blood Plasma, Transfusion, etc.," Dr Earle B Mahoney, "Analgesia," Dr James K Quigley, "Manikin, Treatment of Posterior Positions," Dr R. N Ritchie, "Episiotomy," Dr Shirley Snow, Jr., "Emergencies of the Third Stage," Dr Karl M Wilson, and "Breech Delivery," Dr J B Loder, with a demonstration of the functioning of the Obstetric Conference. A dinner will be at the University Club at 6 30 P M, and at 8 45 P M Dr F J Schoenck will talk on "Normal Labor, Sepsis, Intercurrent Disease."

April 10, 1941, Watertown, meeting of county representatives and postgraduate education program, District 7, Jefferson, Lewis, Herkimer, and Hamilton counties, Dr James L Crossley,

regional chairman.—Demonstration of functioning of Obstetric Conference will be given. Plans for the remainder of the programs have not been completed.

Plans are also under way for a meeting of District 4. This district includes Schenectady, Fulton, Montgomery, Schoharie, Greene, and Ulster counties, with Dr W M Mallis as regional chairman. The date is tentatively set for late March. Dr Charles Gordon will arrange the program, which will include a demonstration of the functioning of the Obstetric Conference.

Invitations to these teaching days will be sent to all physicians in the counties included in the districts. However, any one interested in these programs is cordially invited to attend. Additional information may be obtained by communication with the regional chairman of the district.

A course of obstetric lectures will be presented to the Tioga County Medical Society under the sponsorship of the Council Committee on Public Health and Education. These lectures will be presented Wednesday evenings starting March 26, 1941, and will continue weekly until April 23, 1941. Meetings will be held alternately at Waverly and Owego. The course will be given by members of the obstetric department of the College of Medicine, Syracuse University.

Public Health News

Distribution of Sulfathiazole by New York State Department of Health

SULFATHIAZOLE has been accepted by the Council on Pharmacy and Chemistry of the American Medical Association and, in addition to sulfapyridine, is now available through the New York State Department of Health to registered doctors of medicine and hospitals for the treatment of pneumococcal infections in patients for whom the purchase of the drug would be a hardship.

The drug is supplied in packages of 60 tablets (0.5 Gm. each) and may be obtained from the same laboratory supply stations and in the same manner as sulfapyridine (See page 302, NEW YORK STATE JOURNAL OF MEDICINE, February 1, 1941).

MEDICAL RACKETS

Medical rackets, ranging from the one wherein persons representing themselves as Federal agents seek to obtain "excess supplies" or other supplies of narcotics from doctors and particularly the relatives of deceased doctors to the familiar ones pertaining to the collection of doctors' accounts, are heard of from time to time. Word has come from Colorado that a medical racketeer is presently working in that state.

The person represents himself as a buyer of second-hand medical and dental equipment, reports the *Journal of the Kansas Medical Society*. He proceeds to obtain the confidence of physicians and offers to buy obsolete and unused equipment. He then explains that check in payment will be issued by his company and leaves with the instruments and is not heard from again.

Oneida County

Dr Albert D Kaiser of Rochester University addressed the Utica Academy of Medicine on February 20 on "Relation of Tonsils to Infection in Children," and Dr Charles Hutchings of Marcy Hospital spoke on "Rabillon in Therapeutics."

Dr T P McGill of Cornell Medical School will be guest speaker before the Academy on March 20. His subject will be "Influenza."

Ontario County

Members of the Canandaigua Medical Society were entertained at the residence of Dr Malcolm R. Blakeslee on February 13. The speaker was Dr Ovid Pearson, of Canandaigua.

Queens County

Members of the county society on February 25 listened to a paper on "Endometriosis," by Dr Robert D Mussey of the Mayo Clinic.

The Friday Afternoon Talks on March 7 and 21, at 4.30, are "Surgical Conditions in Infancy and Childhood," by Dr Carl H. Laws, pediatrician, Long Island College Hospital, consultant pediatrician to Mary Immaculate, Lutheran, and Coney Island hospitals, "Diagnostic and Therapeutic Aspects of Sterility," by Dr Samuel L. Siegler, gynecologist, Brooklyn Hospital, obstetrician and gynecologist, Brooklyn Women's Hospital. The latter lecture will include an interesting exhibit of the essential apparatus, instruments, prepared microscopic slides, and animals used in the investigation of sterility.

Dr August W F Westhoff, of Richmond Hill, marked his fiftieth anniversary in medicine on February 20 at a testimonial dinner given by 200 of his colleagues and other friends, held in the Essex House, Manhattan. It was a tribute to Dr Westhoff's thirty years of service with the Wyckoff Heights and Bethany Deaconess hospitals.

Richmond County

The common cold, pneumonia, and other respiratory ailments were discussed at an open

meeting on February 25 in the auditorium of the Richmond Health Center, St George.

Dr Herbert A. Cochrane, president of the county society and attending physician at St Vincent's Hospital, spoke. A film illustrating discoveries by medical science in the study of these diseases was shown by the Health Department.

St. Lawrence County

Dr Orton E White was elected president of the Massena Physicians' Association at a meeting on February 9. Dr Philip Mardon was elected secretary, Dr R. F. McAloon, treasurer.

The physicians met to organize a club and to discuss the drive for raising funds for the Massena Memorial Hospital Association. They went on record as unanimously favoring the hospital and approved the Romeo property as the site selected.

Saratoga County

Members of the county society spent an interesting day in Saratoga Springs on February 12, beginning with inspection of the research department of The G F Harvey Company, manufacturing chemists, and concluding with a visit to the new drink hall of Saratoga Reservation.

After leaving the laboratory the business meeting of the society was held at the Saratoga Hospital, with Dr Gilberto S. Pesquera, recently elected president, in the chair.

In the scientific program, arranged by Dr T J Goodfellow, members of the hospital staff presented a pneumonia series treated by chemotherapy.

Treatment of lymphogranuloma was discussed by Dr F J Ressegue.

The health motion picture, "Bobby Goes to School," also was shown.

Members were dinner guests of the hospital staff at the Nurses Home.

Schenectady County

The county society met on March 4 at Ellis Hospital and heard a paper by Dr Ellis Kellert on "Disease Patterns in Dermatology."

Club, on "The Prophylaxis and After Treatment of the Toxemias of Pregnancy"

The unjust criticism, which, it is felt, has been made of the doctors who are serving as examining physicians under the selective service act, was the subject of lively discussion at the meeting, as reported in the local press

In discussing the situation, most of the medical men felt that the members of their profession who are performing the gratis, patriotic service are being unjustly subjected to criticism on the part of the general public because of the number of men who are passed locally and then rejected at the induction centers. As previously pointed out, it is through the use of x-rays and similar costly equipment that defects, not discernible here, are detected at Albany. The society also proposed that examining physicians be paid

Jefferson County

The county society met at the Black River Valley Club on February 13 with dinner at 6 30. Dr Paul H. Garvey, chief neurologist at the Strong Memorial Hospital, Rochester, spoke on "Diseases of the Nervous System"

Kings County

"Our Need for a New Building" was discussed at the executive session of the county society on February 18. At the scientific session the members heard an address on "The Management of Injuries of the Hand," by Dr Henry C Marble, of Boston.

The speakers and subjects of the coming Friday Afternoon Lectures at the MacNaughton Auditorium at 4 30 are as follows: March 21—Dr Charles Mazer, Philadelphia, "Menstrual Disorders and Sterility" (motion pictures will be presented with this lecture), March 28—Dr Priscilla White, Boston, "The Diabetic Child", April 4—Dr Frank Bethel Cross, Brooklyn (subject to be announced next month), April 11—(Good Friday—no lecture), April 18—Dr Benjamin Kramer, Brooklyn, "The Uses and Abuses of Vitamin D Therapy", April 25—Dr James S. Greene, New York City, "Speech and Voice Disorders, a Medical Problem."

The Round-Table Therapeutic Reviews, held at the MacNaughton Auditorium on Mondays at 4 30, will have the following speakers and topics: March 17—Dr Edwin P. Maynard, "Treatment of Angina Pectoris and Coronary Thrombosis", March 24—Dr John H. Crawford, "Treatment of Congestive Heart Failure", March 31—Dr Joseph C. G. Regan, "Sera and Vaccines in the Prevention and Treatment of Contagious and Infectious Diseases", April 7—Dr Matthew Walzer, "Treatment of Hay Fever and Asthma", April 14—Dr Fedor L. Senger, "Treatment of Infections of the Urinary Tract", April 21—Dr Marion B. Sulzberger, "Treatment of the More Common Skin Diseases", April 28—Dr Charles Solomon, "The Use and Abuse of Hypnotics and Sedatives."

Dr Joseph Glamkowski has been chosen president of the North Brooklyn Medical Society

The Williamsburg Medical Society met on March 10 and heard a paper on "Jaundice" by Dr Reginald Fitz, of Boston

The Doctors' Club of Brooklyn held its annual dinner-dance at Pierre's, New York, January 11, 1941. Among the guests was the English Consul who was presented with an emergency kit as a gift from the Doctors' Club to the English Army. The occasion of the dinner-dance was the installation of the new officers of the club—president, Dr Ira Mensher, vice-president, Dr Karl Kaplan, secretary, Dr Siegfried Block, and treasurer, Dr Elias Reed. Chairman of the Dinner Committee was Dr Reed. There was dancing and entertainment. About 250 people were present.—Reported by Siegfried Block, Secretary

Monroe County

The county society, as reported in the Rochester papers, has refused to accept the responsibility for the sending of unfit draft selectees to Army induction stations, although some of the selectees rejected by Army medical officers claim they were sent home facing embarrassment and financial sacrifices

In a resolution adopted at a meeting of the society's governing board, the group declared that it is "not assuming the responsibilities for any of the details of administering the Selective Service Act unless specifically requested to do so by proper authority"

Further, the board sidetracked a proposal that the society take the initiative and call a conference of local board examining physicians and Army medical officers to clarify the civilian doctors' views of Army physical regulations.

To replace Dr John J. Rooney, treasurer, who has left the city, the board elected Dr Willard H. Veeder

"Painful Feet and Aching Back" was the subject of the fourth of a series of illustrated public lectures on February 23 at the Rochester Academy of Medicine. Dr R. Plato Schwartz and Dr Carl T. Harris were the speakers

The series is being held under sponsorship of the Academy of Medicine, the county society, and the University of Rochester School of Medicine. Dr Sol C. Davidson heads the committee in charge

Nassau County

The county society held a dinner-dance to celebrate its twentieth anniversary on February 21 at the Garden City Hotel. The net proceeds were given to the society's benevolent fund

New York County

The following scientific program was presented at the meeting of the county society on February 24: (1) "Some of the Medical Problems of the Chemical Warfare Service," by Lt.-Col. M. E. Barker, Chemical Warfare Service, Washington, D. C., by invitation, (2) "The Doctor's Relation to Aviation," by Dr Samuel M. Strong, Flushing, New York, by invitation, (3) "Mental Hygiene Aspect of the Deferred Draftee," by Dr Lowell S. Selling, director, Psychopathic Clinic, Recorder's Court, Detroit, by invitation.

Dr Bret Ratner was a guest speaker at the fifty-sixth Annual Session of the Mid-South Postgraduate Medical Assembly, Memphis, Tennessee, February 13. His subject was "The Asthmatic Child"

Albany and Washington was brought before an interested audience by Mrs Albert Vander Veer II, state chairman of legislation. A tea was given in her honor at the home of Mrs W F Smith, president. This meeting afforded the members an opportunity which has long been desired.

Kings. A varied program that included a talk by Dr Adele E Streeseman, chairman of the advisory council, a descriptive lecture by Mrs Lewis P Addoms on "The Motion Picture Council", and a book review by Mrs C A. Peake gave the February assemblage of doctors' wives an afternoon of worthwhile entertainment. A business meeting and social hour were also part of the program. Mr E A. Griffin has donated a very beautiful piece of needlepoint to be sold, the proceeds of which will be used for the Physicians' Home, Incorporated.

Montgomery. So successful was the dinner party held at the Elk's Club for the physicians and their wives that it was unanimously decided to make this an annual event. A delightful program of exhibition dances was followed by games and cards. Mrs Martin F Geruso and her committee deserve commendable recognition for their efficient work.

Onondaga. At a recent meeting Mrs C G Murdock, program chairman, introduced Dr

E E Van Duyn, of Syracuse, who spoke on medical preparedness. He is directing medical defense work in Onondaga County and is outlining a complete organization of the army unit. The importance of nursing and Red Cross work were stressed.

Queens. About fifty members attended the first regular monthly meeting held at the Society Building in Forest Hills on January 28. Mrs Thelma Lippe reviewed several Broadway plays. Her charm and personality delighted her audience. Five new members were admitted to the auxiliary. Over four hundred attended the luncheon and bridge held at Pierre's on February 5. A delicious luncheon, beautiful prizes, and a delightful atmosphere made an afternoon long to be remembered. A vote of thanks goes to Mrs Edward Veprovsky and her committee for the successful as well as financial result of their work. The second series of teas took place at the home of Mrs Alfred Angrist, of Jamaica, on February 18. Mrs William Lavelle, of Long Island City, introduced at the regular February meeting the speaker of the evening, Mr Alfred Dickson. His topic was "Speech, the Most Valuable Implement of Man." Mr Dickson is in charge of the speech department of Sarah Lawrence College, and the producer and director of the "Theatre of the Air" on Station WOV.

Dr William S Ladd, dean, Cornell University College of Medicine, New York City, has arranged a course of lectures on general medicine for the Oneida County Medical Society, Utica, New York. The course, currently being given, is as follows: March 3 "Newer Chemotherapeutic Methods," Dr Norman Plummer, New York City, March 10 "The Significance of Laboratory Tests and Methods in the Practice of Medicine," Dr Robert Barr McKittick, New York City, March 17 "The Relation of Vitamins to Disease," Dr Norman Jolliffe, New York City, March 24 "Abdominal Pain," Dr Edward M Livingston, New York City, March 31 "Various Aids in the Diagnosis of Cancer," Dr Louis C Kress, director, Division of Cancer Control, State Health Department, Albany.

The Medical Society of the District of Columbia has authorized the establishment of a twenty-four-hour telephone service. The Society has granted a loan of \$1,000 to subsidize the Medical Bureau, as the service is called, during the first six months. More than 100 physicians have subscribed to the bureau, according to *Medical Annals*, as quoted in the *Connecticut State Medical Journal*. The goal of 200 members is expected to be reached before another directory is issued. The bureau is offering two types of service, an Alternate Listing Service and a Secretarial Service. The former is the well-known listing, "if no answer call," while in the latter service the physician's office is connected with the bureau switchboard by a private wire.

Dr Clarence E de la Chapelle of the New York University College of Medicine has arranged a course on heart disease for the Chemango County Medical Society to be given at the Norwich Club, Norwich, New York, at 4 30 p.m. April 3 "Cardiac Structure and Its Disorders," Dr Irving Graef, April 10 "Cardiac Functions and Their Disorders," Dr Charles E Kossman, April 17 "Rheumatic Fever and Rheumatic Heart Disease," Dr Currier McEwen, April 24 "Hypertension and Hypertensive Heart Disease," Dr William Goldring, May 8 "Syphilitic and Arteriosclerotic Heart Disease," Dr C E de la Chapelle. The speakers are on the faculty of the New York University College of Medicine.

The following lectures on obstetrics will be given before the Tioga County Medical Society on Wednesdays, at 6 30 p.m.—alternately at Waverly and Owego: March 28 "Normal Labor, Sepsis, Intercurrent Diseases," Dr F J Schoeneck, April 2 "Prenatal and Postnatal Care, Care of Newborn, Pelvimetry," Dr Merten C Hatch, April 9 "Hemorrhages of Pregnancy," Dr Francis R. Irving, April 16 "Operative Deliveries, Breech Delivery," Dr Raymond J Pieri, April 23 "Twinings of Pregnancy," Dr Edward C Hughes.

All the speakers are professors of obstetrics at the Syracuse University College of Medicine, Syracuse, New York.

Woman's Auxiliary

To the Medical Society of the State of New York

CONVENTION—"Hello! Carl! say—what's all this fuss about this particular convention?" "I'm surprised, Pete, that you don't know, but here's the answer. For the first time in the history of the Erie County Medical Society, the ladies are officially playing hostess to the doctor's wives (and their friends) of the empire state. Here is what *they* say about it. 'All roads lead to Buffalo, April 28, 1941. It makes no difference whether you come with Josephine in a flying machine or Lucile in a merry automobile or just an everyday choochoo as long as you arrive. Toss your cares to the four winds, and pack your troubles in your old kit bag. This will be no place for a misanthrope or misogynist. From the bellhop of the Hotel Statler (our headquarters) to the president of our auxiliary, we greet you. You will find a great big welcome on the mat, and *welcome, bienvenue, bien venido, caed milia falle, szalom wilamy, szwesen-vanlatva, welkomen, bewenuto* resounding from every corner. This is to be a convention that will go down in the history of the organization as one devoted to the promotion of joy and good fellowship. We're here to greet you with open arms.'"

BETTY H. WERTZ, *Chairman of Convention*

Auxiliary's Fifth Birthday

To commemorate this notable event the state historian, Mrs. Otto Plaff, of Oneida County, has abstracted a summary of the progress of our State Auxiliary. On March 11, 1936, a meeting to organize the Woman's Auxiliary to the Medical Society of the State of New York was held at the Waldorf-Astoria in New York City. Mrs. John L. Bauer, the organizing chairman, called the meeting to order. Present were Mrs. Roger M. Herbert, of Nashville, Tennessee, who at that time was president of the Woman's Auxiliary of the American Medical Association, Mrs. Samuel G. Red, of Houston, Texas, founder of the Woman's Auxiliary, delegates and alternates from Nassau, Queens, Kings, Onondaga, and Cayuga counties. At this time the following officers were elected with the exception of the president and recording secretary who were elected by acclamation: president, Mrs. J. L. Bauer, of Brooklyn, president-elect, Mrs. F. R. Irving, of Syracuse, first vice-president, Mrs. E. Fleming, of Forest Hills, second vice-president, Mrs. F. Elliott, of Brooklyn, recording secretary, Mrs. H. L. Hirsch, of Rockville Centre, treasurer, Mrs. D. J. Swann, of Brooklyn, board of directors (three years), Mrs. Charles Goodrich, of Brooklyn, and Mrs. A. M. Bell, of Sea Cliff, (two years), Mrs. H. S. Bull, of Auburn, and Mrs. J. W. Pennock, of Syracuse, (one year), Mrs. B. Birkowitz, of Brooklyn, and Mrs. E. A. Griffin, of Brooklyn. The first executive board meeting convened April 2, 1936, at the home of Mrs. J. L. Bauer in Brooklyn. Plans were made to attend the first convention at the Waldorf-Astoria during the same month. Under the able leadership of Mrs. Bauer and with the aid of the organization chairman, Mrs. E. Flem-

ing, the counties soon began to show an interest in being part of the Auxiliary.

At the present time a total of twenty-six interested active counties are working to further the aims of the medical society. A few of the projects have been the Speakers' Bureaus among the physicians, Maternal Welfare Campaigns, Cancer Control, Mental Hygiene, Educational Programs on Venereal Diseases, Girl and Boy Scout work, furthering the reading of Hygiene and other medical literature, and Medical Legislation.

The following have held the office of president: Mesdames Bauer, F. R. Irving, of Syracuse, D. J. Swann, of Flushing, G. S. Towne, of Saratoga, L. H. Kice, of Garden City. Mrs. G. B. Adams, of Auburn, is the incoming president. Although but five years have passed, a permanent place has been carved by this organization through its sincerity of endeavor and loyal support of its members.

County News

Albany. Dr. Harold T. Street, nutrition expert of the Winthrop Chemical Company, gave an illustrated lecture on "Vitamins in Everyday Life" at a dinner meeting of the auxiliary held in January. Favorable comment was made on the amount of valuable information gained by this project. A tour of the chemical plant followed. The excellent attendance for this meeting was gratifying. The public of Albany County is to have the unusual opportunity to hear Dr. Haven Emerson, professor of public health administration at Columbia University, New York City, speak on "Compulsory Health Insurance or Voluntary Sickness Insurance." This campaign is being sponsored by the auxiliary under the direction of its president, Mrs. A. L. Madden. The publicity has been ably conducted by Mrs. J. B. Horner, who has extended the information to the cities of Amsterdam, Gloversville, Glens Falls, Hudson, Saratoga, Schenectady, Troy, Ballston, Cambridge, Catskill, Cobleskill, Cohoes, and Rutland, Vermont. An auxiliary must be appreciated and esteemed when it transfigures to the public a vital and eminent topic such as Dr. Emerson will present.

Columbia. The first assembly of 1941 was well attended at the Cavell House of the Hudson City Hospital. Mrs. R. L. Bowerhan, of Copake, presided. It was voted to send \$10 to the Physicians' Home, Incorporated, and \$25 to the fund for student nurses. Dr. W. J. L. McDonald, county health commissioner, gave an interesting talk on the functioning of a county health unit.

Fulton. The February meeting convened at the Hotel Johnstown. Mrs. B. G. McKillip conducted the business affairs after which a card party was enjoyed. Mrs. J. E. Grant, of Northville, and Mrs. K. P. Foster, of Gloversville, were named as delegates to the state convention.

Jefferson. Medical legislation pending in

"...Casein Modified"

Curd of
Breast Milk

Curd of
Cow's Milk

Curd of
SIMILAC

ACCEPTED

In human milk $\frac{2}{3}$ of the protein is in true solution, while in cow's milk only $\frac{1}{6}$ of the protein is soluble. During the process employed in preparing Similac the soluble proteins in cow's milk are increased to a point approximating the soluble proteins in human milk. How greatly this improves the digestibility is indicated by a comparison of the curd (insoluble calcium paracaseinate) formed by cow's milk, with the soft flocculent curd of Similac. The softer the curd the shorter the digestive period.* Similac, like breast milk, has a consistently zero curd tension.

* Espe & Dye — Effect of Curd Tension on the Digestibility of milk — Amer Journal Diseases of Children — 1932 Vol 43 p 62

HEMATINIC PLASTULES*

The Modern Iron Therapy

● Hematinic Plastules provide ferrous iron in small soluble elastic capsules—a modern, convenient dosage form. Where iron therapy is indicated, Hematinic Plastules can usually be relied upon to bring about a steady, rapid rise in hemoglobin. Their administration is seldom complicated by gastric disturbance. Hematinic Plastules are an economical iron preparation especially effective for the treatment of the iron deficiency anemia of pregnancy, for chronic blood loss, or post-infection anemia.

Reg. U. S. Pat. Off.

Hematinic Plastules are available in two types, Plain or with Liver Concentrate, in bottles of 50 and 100

AMERICAN SUNDRIES CO., INC., BROOKLYN, N.Y.

“LOOKING TO HOME” IN HEALTH TRAVEL

WITH a “No Business During Alterations” sign on the entrances to most of the countries in Europe, Americans are beginning to learn that “Saratoga” isn’t just the name of a race track, and Warm Springs and Hot Springs are not some new kind of gadget for keeping comfortable during cold winter nights. So it’s an ill wind that blows nobody good, or rather, a tame war that does no good—for countries that stay out of it.

Vichy, known best to many Americans as a fashionable health resort, is now merely a war name. Carlsbad and other equally noted European spas aren’t even in the news. The once nice, well-to-do American hydrotherapeutic patients are learning that even in “water-cures” there is no place like home.

A report of the United States Travel Bureau states that the National Spas of our West expect their largest attendance in 1941. Government-owned and supervised, fees fixed and moderate, the American spa has much to recommend it, war or no war. Ranking among the best in the world, our great National Parks contain several ranging from a cosmopolitan formality in the larger spas to a more exclusive atmosphere where even the fastidious can be contented in the American way of “taking the cure.”

The fact that at renowned Hot Springs in Arkansas

some twenty-five thousand guests can be accommodated at one time, is some evidence of the new-found popularity of American health resorts.

But let’s look a little closer to home. Rich as in many things we need, New York State contains almost unlimited resources and facilities for the restoration of health and the care of the ill.

Few states or countries for that matter can boast of so many advantages for the treatment and convalescence of its people in poor health as can this State of ours. Here we have the high, dry altitudes so helpful in some cases of tuberculosis and other types of illness. We have fine spas and mineral waters useful in treating certain cases of deficiencies. Saratoga Spa, famous since 1773, is the only place with medicinal waters east of the Rockies that has naturally carbonated waters. There are seaside resorts for those who may benefit from salt-laden air or bathing in the salt ocean water. Excellent camping and outdoor recreational centers, for those needing the stimulus of nature, are plentiful. And, notably, the State has a wealth of the finest institutions for the care and treatment of every kind of disease and chronic ailment.

If it’s a case of “travel for health,” the answer may often be found right within the State at a minimum of expense and inconvenience for a patient.

MEETING ATTENDANCES AND INTEREST

ACCORDING TO A RELIABLE SOURCE of information, over 18,500 recorded major conventions and meetings are held each year in the United States and Canada. These events range in attendance from a handful of 10 to audiences of more than 700,000. It is difficult to arrive at any exact average attendance as the reports are incomplete—some being purely guesses, some publishing no figures, and most giving totals in round numbers only.

However, from our cursory survey a fair estimate of about 3,200 average per meeting has been obtained. If this figure is reasonably representative, then the total attendance for all the meetings must top 59 million. This seems incredible until we pause to consider that there must be considerable duplication and overlapping of individuals.

In medical and allied fields, we found only 117 meetings so far announced for this year. We say *only* because compared to the total given above, it does appear rather insignificant. Still, here there is no record made

of hundreds of district and county or smaller meetings which do not have exhibits as part of the functions.

Attendance at these meetings last year totaled 110,946 or an average of approximately 950 per meeting. The total memberships of the societies holding these National and State conventions amounts to 270,925. This indicates that less than half, or 41 per cent of the members attend meetings. Here again some allowance should be made for persons attending more than one meeting.

Taking into consideration that the medical or allied meeting is generally a closed affair, the attendance is proportionately better than that at the general run of conventions, meetings and shows. Most of the general meetings admit the public or non-members which naturally swells the attendance in many cases far out of proportion to a strictly membership affair.

This is evident also, to a lesser degree however, in some dental and some hospital meetings. But where the public is invited, it is not the practice to tabulate such visitors.

Hospitals and Sanitariums

Institutions of Specialized Treatments

SANATORIUMS AND/OR SANITARIUMS

To THE LAYMAN who has become a patient requiring some special treatment, a sanatorium can be a sanitarium or a sanitarium can be a sanatorium for all it matters. To the advising physician, however, there is a distinction.

There is a greater dividing line than the mere technical definitions. Probably modern indifference has had a tendency to erase the correct usage of the titles Sanatorium and Sanitarium. As doctors know, of course, and operators of such institutions should know naturally, a sanatorium (quoting Webster) is an institution for the care of invalids or the treatment of particular diseases

A sanitarium (still quoting Webster) is a sanatorium—especially one where the treatment is *prophylactic* instead of *therapeutic*. Another version of "Webster" makes no distinct difference, but gives an added touch to the description of a sanatorium as being a resort having natural aids for curing the sick.

If the names are taken seriously then, and literally, the doctor wouldn't send a patient already in ill health to a sanitarium where, if we are interpreting correctly, treatment consists purely of the prevention of disease.

But sanitarium or sanatorium, or call it by any other name, these institutions that can hardly be replaced in the

ing and 430 for the miscellaneous. In the State division, average figures are 900 for medical and surgical, 980 for dental, 775 for hospital and 220 for the miscellaneous meeting. The per cent attending on a basis of membership under National amounts to 19 per cent for medical and surgical associations, 206 per cent for the dental, 189 per cent for the hospital and 27 per cent for miscellaneous. Under State, the percentages are 29 for medical and surgical, 79 for dental, 191 for hospital and 68 for miscellaneous.

The figures give a rather poor impression of interest shown in the medical and surgical meetings, but it must be remembered that the attendances at dental and hospital conventions are bolstered, as stated before, by the inclusion of others not members or actually colleagues. In addition, in specific cases, members of auxiliaries attending are included also in registration figures. At medical and surgical meetings, to the contrary, such organizations taking part in the program have their own registrations and are not reported in the membership attendance.

The figures also suggest that State meetings are more heavily attended than are the National conventions, although this does not hold true in dental meetings. This is to be expected as the time and expense element connected with attending a distant National convention does not exactly encourage a greater percentage of attendance.

How do meetings of the Medical Society of the State of New York stack up with these comparisons? Last year, when a more accurate system of recording attendance was installed, 3,640 physicians were registered. This amounted to almost 20 per cent of the Society's

total membership. It represents about 15 per cent of the total attendance at all State medical meetings and 8 per cent of the combined attendance at National and State medical conventions.

Compared with all meetings of a professional nature, the New York State meeting ranked second in size in the medical and surgical group and fifth in all branches of healing. Actually, for reasons previously given, it should rate second in all branches as well, for besides the A.M.A., only three dental meetings surpassed our attendance by a small margin and these solely because their figures covered more than just members.

If we consider that the A.M.A. has over five times the membership of the Medical Society of the State of New York from which to obtain attendance at its meetings, the New York State meeting makes even a better showing and truly becomes the leading convention of its kind in point of membership interest. If we use another measuring stick—the number of technical exhibitors, taking a material interest in the meetings—our State meeting looms up proportionately as important as any National convention and considerably more valuable to them than any other State medical event.

Of course, the meeting at Buffalo this year is not expected to surpass last year's record in attendance due to smaller facilities, geographical location and distance from the State's center of population, but we do anticipate the largest and most successful up-State meeting in the history of the Society.

Every member who can spare a day or two is urged to attend this meeting, for many current and pertinent subjects of importance to all New York State physicians are scheduled for discussion and consideration.

BRIGHAM HALL HOSPITAL

AT CANANDAIGUA, N. Y.

FOR MENTAL AND NERVOUS PATIENTS. An excellent institutional atmosphere. Treatment modern, scientific, individual. Moderate rates. Licensed by Dept. of Mental Hygiene. (See also our advertisement in the Medical Directory of N. Y., N. J. and Conn.) Address inquiries to MARGARET TAYLOR ROSS, M.D., Physician-in-Charge

complete care of the chronic sick, the convalescent, or the invalid are to be judged by what they can do and how they do it rather than what they choose to be called. At least that's our main concern.

A study of advertisers in this important department is extremely interesting. Here you will find an exceptionally fine representation of institutions conveniently located for the patients of physicians in this State. The appeal of location as an essential factor in the ultimate choice of both the physician and patient is stressed by many of the advertisers.

Environment seems to be a second weighty factor, for it is noted almost as often as distance. Another important distinction, probably more important to the institution than to the patient or his physician although it does carry weight, is the number of years the institution has been established. Rates seem significant to some but ignored by others, yet it is probably the chief factor in a decision more times than it is not.

Some discriminate against receiving particularly "difficult to handle" cases. Some specify that only selected cases are accepted.

In instances the vagueness of meaning, unintentional as it may be, makes it necessary for physicians to obtain more definite information. At any rate, it is a physician's duty to be as well informed as possible on even seemingly small matters pertaining to the sanitarium he contemplates recommending to a patient. It will pay him to get complete information on a number of sanitariums well in advance of any need. Many of them have literature convenient for filing where you can have available information for a patient when the time for recommending a sanitarium has arrived.

Some twenty well-recommended institutions covering every need for a sanitarium appear regularly in this department of your JOURNAL.

You will find them all unusually cooperative and efficient aides in the success of your practice.

MEETING ATTENDANCES AND INTEREST

(Continued from page 634)

in the reported attendance. Ordinarily, non-members attending are actually persons in the same profession or of some closely connected field. As in the case of some dental meetings, dental hygienists and other assistants when officially invited may be included in the total registration.

In the case of hospital meetings, similarly, lay employees of the staffs and nurses often take a part in the program and special functions. This custom leads to a showing in published figures of an attendance often exceeding the entire membership of the association.

A comparison of the 117 meetings in medical, surgical and allied fields is extremely interesting. We must acknowledge the incompleteness of the report studied, but taking the material available we found that the 117 meetings included thirty-three National conventions and eighty-four State meetings. In the National classification, medical and surgical meetings total 12, dental 6,

hospital 5 and miscellaneous "health" associations numbered 10. Meetings under the heading "State" comprised 35 medical and surgical, 33 dental, 8 hospital and 8 miscellaneous.

Attendances at these meetings were reported as 45,623 for the National group and 65,323 for the State group. Breaking these totals down, National medical and surgical conventions were attended by 21,191 persons, National dental meetings by 13,088, National Hospital by 7,003 and miscellaneous by 4,341. Under the State listing, 24,984 attended the medical and surgical meetings, 32,418 attended dental meetings (this figure includes other persons besides doctors of dentistry), 6,197 the hospital meetings and the balance of 1,744 miscellaneous events.

The average attendance in the National classification is approximately 1,750 per medical and surgical convention, 2,160 per dental meeting, 1,400 per hospital meet-

NEW YORK STATE JOURNAL OF MEDICINE

Copyright 1941 by the Medical Society of the State of New York

VOLUME 41

APRIL 1, 1941

NUMBER 7

Editorial

You Will Never . . .

You will never operate under a carbolic acid shower. You will probably never carry a catheter in the sweatband of your hat. You will never see tan bark on the streets around hospitals to prevent noise or bales of oakum and peat moss in hospital corridors to be used as overdressing for infected wounds. You will never see 100 cases of typhoid in a row or 5 in one family die of diphtheria in one and one-half hours!

At the one hundred and thirty-fifth annual meeting of the Medical Society of the State of New York, 1941, in Buffalo, you will see not a single tracheotomy demonstrated or 1 case of diphtheria intubated. Yet at the time of the eighty-first meeting O'Dwyer's tubes were the surgeon's hope. Of his experiences Jacoby wrote "nearly 3,000 tracheotomies, 2,800 terminated in death." Fifty-four years

You might come to Buffalo on April 28 by steam train or arrive in a horse-drawn buggy, if you live close by, as you would have come to the eighty-first meeting, but the chances are you will come by automobile or plane this year, if you can, and keep in touch with your office by using the improved facilities of Mr. Bell's recently developed telephone. If you are unavoidably prevented from attending, you may be able to hear some of the proceedings through the courtesy of Senatore Marconi, Dr. Lee DeForest, and others of our recent co-workers in science. And we can assure you that they will be worth hearing.

We think it only fair to remind members that while in Buffalo they will be within the jurisdiction of the hardy and formidable Medical Society of the County of Erie. In the year 1827 the society's receipts in membership fees amounted to \$11. A resolution authorized the treasurer "to collect outstanding dues from members—peaceably if he can, forcibly if he must." Such is the quality of our hosts. Surely the visiting membership of the State Society can reasonably expect great things from men of such caliber, vigor, and determination.

In passing, it is of more than historic interest that in the University of Buffalo, founded in 1846, Dr. White raised a storm of protest in Buffalo, throughout the state, and, indeed, throughout the United States by "introducing demonstrative or clinical midwifery" into the college course. It had never before been attempted in this country. "Seldom," it is said, "has an event occurred that so completely shook the foundations of society in any city as did this." Newspapers denounced it as immoral. Dr. White was drawn into the law courts and was vindicated, for many years he continued to teach obstetrics and gynecology in the university.

Noteworthy also is the fact that Dr. Roswell Park and Assemblyman Henry W. Hill secured in 1898 from the Legislature the first appropriation ever made from public funds, either in this country or abroad, for the purpose of combating the ravages of cancer.

READER INTEREST

To some advertisers, circulation is the only yardstick for measuring the reader interest in any publication. This evaluation carries weight only in publications having paid subscriptions and possibly a newsstand sale. The latter is perhaps the only *bona fide* check on a true reader interest, in as far as the articles or stories are concerned. It, however, does not guarantee that the purchasers are interested in any advertisements published.

A more reliable check of reader interest may be had from a study of the turnover of advertisers in a publication. A publication in which the same advertisers appear issue after issue, year after year, certainly must have the cherished reader interest or these advertisers would not

Approach to Health

Let it be assumed that all parties at interest—government, voluntary agencies, organized medicine, the press, and the public—sincerely desire for the American people the maximum of health obtainable. At once, the end, the objective, is removed from the field of controversy. How to obtain it? Here, concerning the means to the end, there is wide divergence of honest opinion among the parties at interest. Why should this be so? Because, first, of the perspective of the problem and because, second, of the absence of factual evidence.

Perspective—Medicine of all the parties at interest stands the closest to the actual means of operation. Whatever means to the agreed end are proposed, medicine is the only agency of all the parties at interest which must know *at first hand* whether the proposed means can or cannot be made practical in operation. And it can know that only to the extent that scientific, factual information exists relating to the subject. Medicine is practical, it does not guess where it can know, it deals with human lives, and health is an attribute of human life, of human minds, and of human bodies.

With respect to the health of young men in New York City, a report by Col Samuel J. Kopetzky of the results of the examinations of 17,540 men between the ages of 21 and 36 shows that 8,883 were accepted for full military duty, 3,984 men were classified as qualified for limited military service, and 4,673 were disqualified (Class F4) as physically unfit for any military service.

The rejections are divisible into four groups

A Developmental Defects—Defective vision, congenital deformities, and the like

B Traumatic Causes—Results of industrial accidents, athletics, accidents from all causes

C Diseases not yet conquered by medical science

D Neglect Due to Ignorance—Lack of attention to nondisabling ailments

that have been permitted to become chronic because they did not interfere with the performance of the duties of civil life

Of the 17,540 men examined 49.36 per cent were rejected, and, of these, 22.71 per cent were classified as able to perform limited military duty. This leaves about 26.64 per cent classified as totally unfit for military duty. Particularly gratifying is the fact that, of the total, mental and nervous conditions accounted for only 4.24 per cent or 745 men. Among the 17,540 registrants only 121 gave two positive serologic tests, some of which were of asymptomatic syphilis. The total number of persons suffering from syphilis was 126 or a percentage of 0.72.

This report compares favorably with figures on the examination of 108,000 men given out by Col Leonard Rowntree, M.C., in Chicago, February 16, 1941. Of the registrants, 32 per cent were rejected because of physical and mental deficiency by draft board physicians. Twelve per cent of these who passed were subsequently rejected by Induction Board physicians.

Disqualifications for heart disease reported by Colonel Kopetzky were 10.75 per cent, defective vision, 11.71 per cent, teeth and gums, 11.37 per cent. There is here being created at last an approach to one phase at least of the national health problem, the assembling of reliable statistical data free from sentimental or emotional embroidery and obfuscation. Governor Lehman, as chairman of the State Defense Council, said on March 6, 1941: "Anything we accomplish in the protection and promotion of health will be lasting. When the threat of war has passed and world peace and good will have been restored, it will be a permanent asset which will pay increased dividends in the years that lie ahead."

"Nearly three thousand men and women in a volunteer capacity are working for the Selective Service System. Doctors, lawyers, business leaders, and

Currently, we are immersed in vast preparations for national defense. These preparations contemplate not only the mobilization of large numbers of men but the mobilization also of the vast store of

technical and scientific knowledge which is available. Much of this will be forthcoming at the annual meeting for your benefit. Make it your business to be there.

Medical Relief

The joint statement on medical relief in the State of New York, published in the March 15, 1941, issue of the JOURNAL over the signatures of Jackson Davis, M D, chief medical officer of the State Department of Social Welfare, and Christopher Wood, M D, chairman of the Subcommittee on Medical Relief of the Medical Society of the State of New York, is a most promising and refreshing contribution, clear, concise, and cogent, to the hitherto murky annals of indigent medical service.

Let no one think that this statement is a joint inspiration. It is the result of a long conflict of many minds, the product of many weary hours of patient conference, argument, research on both sides. And the work is by no means finished. While it may be said that the State Department of Social Welfare "is not unsympathetic toward these principles," it feels "that much additional thought and study are necessary, especially with reference to local conditions, before a common ground can be reached." The principles referred to concern the disapproval of contract practice and the exploitation of clinics in the care of the indigent. On all other matters, there seems to be a fair degree of agreement on the part of all concerned.

We should like to see the medical care of the indigent in this state put upon as rational and intelligent a foundation as the care of injured workmen now is. It cannot be done in a moment. The Workmen's Compensation Law and practice under it took many years and much revision to reach its present state of development. As the joint statement points out, "Any platform adopted by the State Medical Society, or by local medical groups, has no force whatever in effecting [?] the conduct of medical re-

lief work unless agreement can be reached with the state and local departments of welfare concerning this platform. Such agreements, if reached, are essentially mutual understandings and in no sense abrogate any portion of the Public Welfare Law." And yet, experiment in certain localities by agreement between the local welfare departments and the local medical profession is to be urged as of the utmost value. How otherwise is factual and clinical experience to be gained? What may work well in one experimental area may not work well at all in another. To know with certainty, experiment is essential. On the basis of data thus accumulated, and probably not before, reasonable changes in regulations and, if necessary, in the law can be made.

From now on, it seems to us imperative that experiment by agreement be undertaken on a county basis. As a suggestion, let these experiments by agreement be designed to provoke interest and active participation in welfare medical service by the most competent medical men in the experimental areas. If the welfare departments will cooperate, no physician should refuse a reasonable donation of his time for this kind of work. It is admitted that the red tape and the hopelessly inadequate financial return at present constitute a very real and solid stumbling block in the way of participation by competent and busy medical men. The same thing was true of workmen's compensation work not so many years ago. It is, however, our firm conviction that rational and cooperative voluntary experiment by competent physicians and intelligent administrators of the public welfare law will serve to demonstrate what can be done and in what respects the law must be changed.

UROSURGERY IN THE YOUNG THE PEDIATRICIAN'S ROLE

MEREDITH F CAMPBELL, M D , New York City

THE initial step in the successful surgical treatment of urologic disease in the young must necessarily be taken by the physician who first sees the patient, whether this physician be a pediatric specialist or general practitioner. It is his responsibility to recognize that a urologic condition probably exists and to know the indications for special urologic investigation. The ever increasing collaboration between pediatricians and urologists is not only producing most gratifying therapeutic results but is reducing the number of children with serious urologic disease whose deaths must be considered the fruit of medical neglect. Children do not outgrow ureteral stricture, infected hydronephrosis, renal tumor, renal tuberculosis, or urinary stones; the diagnosis of chronic pyelitis, enuresis, or simply weak bladder too often satisfies the physician.

More than 90 per cent of urologic lesions in the young result from anomalous development, urinary infection, or their combined effect. The incidence of maldevelopment is higher in the urinary tract than in any other system (in 5 to 13 per cent of all bodies studied postmortem), and the consequent incidence of urologic disease is correspondingly high, especially in the young. Innumerable children never reach adulthood because of these factors. The present discussion is a brief consideration of urologic diagnosis in children together with a few suggestions as to how the pediatrician may be expected to cooperate in the urologic treatment.

The indications for special urologic examination in infants and children follow:

Pyuria Which Persists One Month Despite Vigorous Medical Treatment—Acute urinary infection usually tends to be clinically self-limited, yet the disappearance of acute manifestations of the disease and the clearing of the urine as determined by urinalysis of the casually voided specimen is too frequently accepted as the test of cure. Yet bacteriologic studies have shown that in a large number of these children the etiologic organisms are still present in the urine as long as six months after clinical cure has been pronounced. In

short, these children are clinically cured but are not bacteriologically cured. With the recurrence of acute obstruction along the urinary tract or of acute focal infection elsewhere in the body, and particularly in the respiratory or gastrointestinal tracts, acute exacerbation of the urinary infection is likely to be observed.

In the study of urinary infection, aseptic collection of the specimen for examination is of prime importance. The specimen for bacteriologic and microscopic examination should always be collected from the woman by catheterization. In the man the prepuce should be retracted and the glans penis washed off with an antiseptic solution, such as oxycyanide of mercury or bichloride of mercury 1:1,000. The patient then voids a small amount of urine, after which the remainder of the bladder content is passed into a sterile receptacle from which the specimen is taken for bacteriologic examination (smear and culture) as well as microscopic analysis. When this technic cannot be satisfactorily employed in the man, catheterization must be performed. Only by following this method in both sexes can contamination of the urine by extraneous factors be avoided.

As to the recognition and designation of pus. No cell should be identified as a pus cell which does not show the "paw broker's" nucleus characteristically found in the polymorphonuclear leukocyte. It is of no moment whether the pus cells are clumped or single, when many cells are present, some are likely to be gathered in clumps. More than three or four white blood cells per low-power field in the uncentrifuged specimen merit clinical attention. Normally, an average of about 300,000 white blood cells and red blood cells are passed from the kidney during twelve hours. But this number is relatively so small as to cause not more than one cell to be seen in a low-power field of the uncentrifuged specimen. Yet the differentiation is rarely as fine as this, for even in mild urinary infections there are apt to be as many as eight or ten leukocytes in the low-power field.

If the cell counts are confined only to well-shaken uncentrifuged urine specimens, there is a constant base factor for the repeated estimations so essential to adequate clinical

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 9, 1940.
From the Departments of Urology and Diseases of Children, New York University College of Medicine and Bellevue Hospital.

others are giving of their time freely as citizens of the community and the nation, " said Col Arthur V McDermott, director of Selective Service for New York City, over WBNX in a radio broadcast on March 9, 1941

From these samples of the general health of the age group under study, it would seem that the pattern of a health program based on realities may be discerned. Such a program would discard wishful thinking for hard, factual observation and be based on logical conclusions drawn from these facts.

All these thousands of doctors and members of the public are thus coming in

direct contact with certain aspects of the national health problem. They are acquiring first-hand information. Multiply this local experience by the thousands of other localities in which others are similarly becoming acquainted at first hand with some of the health problems of the nation. It is a most wholesome and unemotional approach to the question of the real facts about the health of America.

When men of honest purpose from all of the agencies concerned get together to solve these health problems, respect for their conclusions is assured, and reason triumphs over emotionalism.

symptoms promptly disappeared. Yet one must not forget that children also have ureteral stone colic, acute vesical retention, tuberculous epididymitis, acute prostatitis, and other urologic diseases that we are more accustomed to encounter in adults.

Tumor Along the Urinary Tract—Hydronephrosis is the commonest renal tumor encountered in children but we are also concerned with neoplasm, perirenal suppuration, and even a distended bladder.

Injury of the Urogenital Tract Calls for Special Urologic Investigation and Management—With the high incidence of coasting, athletic, and automobile injuries of the young, the problem of urogenital trauma, and especially of the kidney, is likely to be recurrent in pediatric practice. These injuries are always potentially grave and, because of the tendency to delayed shock in children, the gravity of the injury is likely to be unappreciated by the physician during early hours following its receipt. These children are likely to be up about and playing for several hours following a serious renal blow, apparently well, yet bleeding internally, but subsequently they pass into profound and sometimes fatal shock. Unless the renal blood supply has been severed or thrombosed by the trauma or the ureter divided or plugged by clots, hematuria will be observed. The combat of shock by blood transfusion, morphine, quiet, and heat, together with hourly blood counts in cases of marked hematuria, are the indicated therapeutic steps. By excretory urography, many pelvic and peripelvic extravasations will be demonstrated without great disturbance to the patient. Mild hematuria without profound shock usually can be safely treated conservatively by absolute rest and watchful waiting. Continued fresh bleeding for twenty-hour hours calls for renal exploration and by observing this criteria many kidneys can be saved by conservative resection or suture according to indication or technical facility. Yet early nephrectomy is often indicated and is usually lifesaving. It cannot be too strongly urged that when bleeding has apparently stopped with conservative treatment, and there is no longer shock, these patients should be kept quiet in bed for a relatively long time, our recommendation is at least ten days. Unfortunately, it is common practice to permit children with moderate renal trauma to be running about within forty-eight hours following cessation of hematuria or even while microscopic hematuria persists. In short,

renal injuries in children are always grave.

Only by keen recognition of these indications for urologic examination and by prompt institution of the special diagnostic investigation implied is it possible to render the patient the greatest therapeutic benefit. An early anatomic diagnosis enables many potentially serious conditions to be corrected by comparatively simple conservative measures. Through failure to recognize early that renal disease exists, nephrectomy often becomes necessary and sometimes a life is needlessly lost. It is now well established that with the exception of certain new growths of the genital tract, children suffer the same urologic diseases as adults. The fundamentals of special urologic examinations and treatment are identical in patients of all ages.

In the surgical management of major urologic disease in children, the best results will be achieved only through closest cooperation between the pediatrician and the urologist. The high metabolic rate of children requires special consideration as do other physiologic processes which in children vary from those of adults. In other words, the child is not a miniature adult and no urologist of my acquaintance is qualified to assume the responsibility of the settlement of the many special pediatric problems which constantly arise in the urosurgical management of infants and young children. Moreover, the urologic surgeon who assumes such management unassisted is apt to be taking upon his shoulders a responsibility which is both unwarranted and unfair alike to the patient and to himself.

In the preoperative preparation of the child, the pediatrician may advisedly have the important hand, particularly in the attainment of the best alimentary conditions possible and in his assurance to the surgeon that the child's cardiovascular and respiratory systems warrant proceeding with the operation. Most urologic operations in the young are elective rather than emergency, and for this reason ample time should be taken for proper preparation of the patient for the surgical treatment. Here the combat of dehydration and acidosis are the two most important considerations. The determination of the renal function by excretory and retention tests may be attended to either by the pediatricist or the urologist. Food ingestion should be maintained until six to ten hours preoperative in older children and until two hours preoperative in infants, since starvation favors the development of acidosis. Moreover, preoperative purgation is condemned because of the

management I employ the centrifuge only to throw down bacteria for staining

With the development of more powerful urinary antiseptics of the mandelic acid and sulfanilamide groups, we are now able to sterilize the urine in many patients with congenital anomalies of the urinary tract or other conditions that cause urinary stasis and in which cases the antiseptics previously employed were valueless. Therefore, in chronic pyuria, and this point cannot be too strongly emphasized, even though we are able to sterilize the urine by these stronger antiseptics, the fact that the pyuria previously persisted at once suggests the existence of urinary stasis. We insist that in these children whose chronic urinary infections have been cured by mandelic acid, or sulfanilamide, an excretory urographic study be made to determine that the urinary tract is morphologically normal before the patient is dismissed. Moreover, no patient should be discharged as cured of urinary infection until at least two native cultures of catheterized, or otherwise aseptically collected, specimens have been obtained. If this dictum is observed, the incidence of so-called "recurrences of acute pyelitis" will be notably reduced.

Acute Fulminating Urinary Infection Which Does Not Respond in Four to Six Days of Intensive Medical Treatment—In most of these cases acute urinary obstruction will be identified as the important accessory factor that causes the acute renal infection to be intensified or prolonged. More often the obstruction is near the renal pelvic outlet (aberrant renal vessels, congenital ureteral stricture, and so forth). The institution of free renal drainage by the passage of a ureter catheter to the pelvis or by nephrostomy is usually followed by regression of the temperature and of the acute toxic manifestations. Yet in some of these cases the process progresses to massive renal suppuration or a localized septic infarct, commonly designated as renal carbuncle. Moreover, secondary perinephritic abscess is not uncommon or the metastatic perinephric abscess without serious renal involvement may disguise as so-called acute pyelitis. In any event, in such hyperacute renal infections one is not justified in calmly standing by and awaiting developments when the initial medical therapy has proved fruitless.

Disturbances of Urinary Function—In persistent frequency of urination the inadequate diagnosis of cystitis is all too commonly made. Cystitis is practically never a primary lesion

but is secondary to renal infection, vesical stone or a foreign body, pericystic inflammation, or disease of the bladder outlet, prostate, or posterior urethra. Persistent frequency of urination of the child usually reflects an unrecognized urinary infection and in many cases there is unsuspected renal tuberculosis. In a large number of children said to have enuresis or just a weak bladder, urethrotiginitis is the underlying lesion. Other disturbances of urination, such as persistent dysuria, strangury, the clinical syndrome loosely designated as enuresis, entitle the child to a special urologic consideration. Particularly is this so in enuresis in which group of children urologic examination is indicated when two or three months of medical therapy fails to achieve the desired result. In about 1,000 cases thus studied we found uropathology adequate to explain the symptomatology in approximately 60 per cent of the cases and many of the patients required surgical treatment. While there is little question that fully 95 per cent of the cases of enuresis are functional in origin, in many cases renal infection or other urinary tract disease exists and in 5 instances I had to perform nephrectomy for renal tuberculosis in children referred for examination with the diagnosis of enuresis. Secondary bladder tuberculosis explained the vesical symptoms. Moreover, the incontinence may be explained in cases of an ectopic ureteral opening in the urethra, at the urethral orifice, or in the introitus. A discussion of the neuromuscular disturbances of the bladder does not fall within the province of this presentation.

Hematuria—Blood in the urine of a child is most likely to reflect acute nephritis. Tumor, nontuberculous, and tuberculous infection are next in order of frequency. Every child whose hematuria is not due to acute nephritis should be subjected to urologic investigation. Strangely enough in many children examined because of hematuria, the blood was found to come from an ulcerated congenitally strictured urethral meatus.

Pain in the Renal, Ureteral, Vesical, Urethral, or Genital Areas—In the upper urinary tract this is usually a matter of hydronephrosis or of ureteral stricture. On the other hand, in children with abdominal pain, especially on the right side, the diagnosis of chronic appendicitis is frequently made. In several children falling in this group, urologic examination has revealed an unsuspected ureteral stricture, with the therapeutic dilatation of the stricture, the general abdominal

CONSERVATIVE SURGERY IN THE TREATMENT OF RECURRENT SALPINGITIS

HENRY C. FALK, M.D., F.A.C.S., New York City

AS A RESULT of the conservative management of gonorrheal salpingitis, it has become evident that clinical cures can be obtained without resorting to surgery. In the past decade, with the addition of new physical therapeutic agents (fever therapy, Elliott treatment) and chemotherapeutic agents (sulfanilamide and its derivatives), the medical management of this disease has become more effective. Notwithstanding the effectiveness of medical therapy, about 20 per cent of the women with gonorrheal salpingitis eventually come to surgery. In private practice the percentage may be lower, in a large municipal hospital it is usually higher.

Surgery is indicated primarily for one of two reasons: (1) to cure disturbing symptoms such as dysmenorrhea, irregular or profuse menstrual bleeding, etc., (2) to prevent recurrent acute gonorrheal salpingitis, resulting in frequent and severe disabling attacks of pain and fever.

In a large city hospital social and economic factors make medical treatment difficult and frequently inadequate. This results in repeated attacks of acute inflammation brought on by reinfection. Surgery in these patients is directed in a large measure toward the relief and prevention of symptoms that destroy their economic and social independence.

In 1870 Lawson Tait¹ founded the operative treatment of salpingitis. No significant advance has been made in the surgical treatment of this condition since Simpson's paper in 1909² when the value of the delayed operation was established.

Salpingectomy is a relatively safe procedure if practiced in accordance with the principles laid down by Simpson. Yet a survey of reported series (Table 1) shows several disadvantages.

1 The mortality rate varies from 1 to 10 per cent. The most important factor in the production of a high mortality rate is operation during the acute phase (Ricci,³ Aldridge²⁹). Operation during the chronic phase has a mortality of from 1 to 2 per cent. This mortality in the hands of qualified surgeons is too high for a disease that does

not threaten life under usual circumstances.

2 There is a high percentage of immediate postoperative morbidity, with delayed convalescence and postoperative indurations and exudates that require prolonged treatment (Norris, 5.8 per cent¹⁴). Farr and Findley²⁸ report that 5 per cent of their cases needed reoperation while in the hospital, chiefly for pelvic abscess. In acute cases Aldridge found a high morbidity of 52.5 per cent, whereas in cases that were clinically and microscopically inactive the morbidity was 18.1 per cent.

3 The ultimate postoperative results are only moderately satisfactory. About 20 per cent need subsequent therapy, either medical or surgical. Aldridge in a critical analysis found 19 per cent unsatisfactory results. Norris and Whitehouse report that 5 per cent of all patients needed subsequent gynecologic operation.

4 The incidence of postoperative ovarian cysts, although difficult to determine, seems to be high. In Aldridge's series 5 per cent of the patients were subsequently found to have either cystic ovaries or ovarian cysts.

5 Sampson³ has called attention to the relatively high frequency of postsalpingectomy endometriosis and ectopic pregnancy in the tubal stump.

6 Technical difficulties often lead to the sacrifice of the ovaries. C. J. Miller,⁴ despite advocating conservative surgery, reports that in 300 cases of salpingectomy 218 had unilateral or bilateral oophorectomy.

As a consequence of these deficiencies many gynecologists have become radical in the belief that the retained uterus and ovaries frequently give rise to subsequent symptoms that require reoperation (Drips and Day,⁵ Gardner⁶). The literature (Tables 2 and 3) gives the impression that the late clinical results of radical surgery are better than those of simple salpingectomy. However, the high primary mortality and morbidity and the fact that it violates every principle of preserving as much of the pelvic organs as possible in young women are serious objections.

Conservative tubal surgery, i.e., unilateral salpingectomy or plastic operations on the tubes, has also proved unsuccessful (Greenhill⁷). Reinfection often occurs which necessitates a second operation.

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 9, 1940.
Director of Gynecology, Harlem Hospital.

dehydration consequent thereto, in younger children, an enema should replace catharsis, in older children a mild laxative such as milk of magnesia or a small dose of castor oil is adequate

In the operating room, it is the duty of the pediatrician and the urologist alike to see that the child's body heat, blood, and fluids are conserved. A hot-water bottle or electric pad for accessory body heating is desirable. Everything should be in readiness for the operation before the anesthesia is started since children stand anesthetics poorly. Post-operatively, the administration of fluids (blood, water, glucose, and saline) and accessory body heating will minimize morbidity during convalescence. We attempt to return the child to his regular diet as soon as it can be tolerated.

Following surgical treatment, and particularly of the upper urinary channels, the eradication of urinary infection is likely to be an important problem in the completion of the cure. The administration of the chosen antiseptic may wisely be supervised by the pediatrician and notably when a sulfanilamide compound is employed. To repeat: no child

should be discharged as cured of urinary infection until at least two negative cultures of a catheterized specimen have been obtained.

Summary

We have discussed the clinical and physiologic reasons for close cooperation between pediatrician and urologist in the urosurgical treatment of children. It is the responsibility of the physician who first sees the child to recognize that a urologic condition probably exists and to know the indications for special urologic examination as herein outlined. An early diagnosis often permits a conservative operation to be performed, delayed diagnosis too often spells nephrectomy and in some cases, death. Such preventable disasters must be considered the fruits of medical neglect. Finally, in the urosurgical management of infants and children, the urologist urgently needs the close cooperation of the pediatrician and as greatly as the pediatrician needs the assistance of the urologist for the special technical examinations necessary to establish a correct anatomic diagnosis in genitourinary tract disease.

140 East 54th Street

DO YOU MEAN ME?

Are you an active member, the kind that would be missed,
Or are you just contented that your name is on the list?
Do you attend the meetings, and mingle with the flock,
Or do you stay at home and criticize and knock?
Do you take an active part to help the work along,
Or are you satisfied to be the kind that "just belong"?
Do you ever go visit a member that is sick?
Or leave the work to just a few and talk about the "clique"?

There's quite a program scheduled that I'm sure you've heard about,
And we'll appreciate if you, too, will come and help us out.
So come to the meetings often, and help with hand and heart.
Don't be just a member, but take an active part.
Think this over, member, you know right from wrong,
Are you an active member, or do you just belong?

"TEACHING DAY" AT POUGHKEEPSIE

Teaching Day on Malignant Disease, arranged for the Dutchess County Medical Society, will take place at Poughkeepsie on April 9. At four o'clock Dr. Arthur Purdy Stout, associate professor of surgery, College of Physicians and Surgeons, Columbia University, will talk on "Problems in Tumor Diagnosis". At five o'clock Dr. George E. Binkley, attending surgeon, Memorial Hospital, New York City, will be heard on "Carcinoma of the Rectum". In the evening, at eight-thirty, Dr. Cornelius P. Rhoads, director, Memorial Hospital, New York City, will speak on "Mode of Action of Carcinogenic Chemicals".

THE DEADLY RUT

Perhaps the most insidious danger to which a professional man is exposed is that of getting into a rut. To follow methods that experience has shown to be successful is sound common sense, but when we assume that the best way has been found, and cease active efforts to enlarge our knowledge and improve our technic, we are in a rut. The line between conservatism and fossilization may be a fine one, but it is vitally important to recognize it.

—Adapted from *United Business Service*,
by *Clinical Medicine*

endometrium, coexisting tubal inflammation was present, and usually gonococci could also be recovered from the tube. Recently, an opportunity presented itself to examine bacteriologically the tubes, ovaries, uterus, and cervix of a patient who had undergone fever therapy. In this patient the temperature, sedimentation rate, and blood count were normal for three weeks, and the cervical and urethral smears that had been positive for gonococci became negative before operation was performed. However, the sudden growth of an adnexal mass after fever therapy made operative intervention seem necessary. At laparotomy this was found to be a simple ovarian cyst. On the opposite side a tubo-ovarian abscess was present. Since both ovaries were destroyed, hysterectomy with bilateral salpingo-oophorectomy was performed. Surprisingly, cultures of the endometrium, endosalpinx, and left ovary were positive for gonococci, although cultures of the extirpated cervix were sterile.

Several other modes of infection are theoretically possible, i.e., hematogenic and lymphogenous. Gonococcal bacteremia occurs rarely and is almost always secondary to pelvic inflammation.¹⁰ That the reverse may occur is possible but highly improbable. It has been pointed out that the gonococcus is an organism that grows best on epithelial surfaces. Under ordinary circumstances it does not penetrate deeply, except by continuous growth along the epithelium of glands (endocervix in women, and prostate in men). The lymphatic apparatus of the pelvis is extremely abundant, yet gonorrheal parametritis is rare. When it does occur it is due to an exudate from the tubes dripping onto the broad ligament or cul-de-sac, thereby producing inflammation by contiguity. Clinically, the term "parametritis" is often loosely used to denote any type of indurated adnexal masses.

However, at operation for gonorrheal salpingitis, true infiltration of the broad ligament itself (excluding peritoneal adhesions, etc.) will not be found in either acute or chronic cases unless there has been direct extension of the infection to the peritoneal surface of the broad ligament. Therefore, extension via the lymphatics is improbable.

As a result it seems logical to believe that recurrent salpingitis is caused by reinfection extending upward to the tubes along the endometrium from the lower genital tract and that any operation that would sever this epithelial continuity would prevent recurrent salpingitis.

Several clinical facts seemed to corroborate this theory.

1 Several cases of fibroids with pus tubes were seen, where at operation, because of technical difficulties or the poor condition of the patient, simple supracervical hysterectomy was performed. All patients became free of symptoms of pelvic infection. In 2 cases, however, secondary operation was thought to be safer for the patient—at laparotomy marked regression in the tubal inflammation had occurred.

2 Despite the fact that salpingitis is known to be bilateral, patients were repeatedly seen in whom there was a pyosalpinx on one side and an apparently normal tube on the other. However, examination of the apparently normal tube proved that the lumen was completely obliterated at the cornual end so that the epithelial extension from the uterus to the ampulla of the tube was anatomically impossible.

3 A number of patients were observed who had been sterilized by cornual resection because of various medical indications. Several of these patients developed an acute cervical gonorrhea, but in no instance did salpingitis develop.

4 Little¹¹ and Holden¹² had shown that cure of salpingitis could be obtained without extirpation of the tubes.

As a result of these considerations cornual resection was instituted as a simplified conservative operation in the treatment of recurrent salpingitis with the following qualifications:

(1) It does not replace the conservative medical management of salpingitis but is indicated only in those instances where recurrent attacks of salpingitis cannot be prevented by prophylactic and medical measures.

(2) It does not cure gonorrhea of the lower gynecologic tract but promotes healing of existing tubal inflammation and prevents recurrent attacks of salpingitis.

(3) It cannot be performed in the face of ovarian infection, this complication demands salpingo-oophorectomy.

(4) It cannot be performed until Simpson's requisites have been satisfied.

During the initial phase of this study, in accordance with investigations of Curtis on the bacteriology of the tube,¹³ it was believed that after several weeks of normal temperature the tubes, in the majority of cases, were sterile. As the investigation progressed, bacteriologic studies were made on the excised tubes, in 16 cases the cultures of the tubal wall were 100

As a result, therefore, of dissatisfaction with the end results of both the so-called conservative and radical operation, a large series of cases of tubal infection were studied on the gynecologic service of Harlem Hospital.

It is well recognized that not every case of gonorrheal infection in women results in salpingitis. The primary portals of entry of the gonococci in women are the urethra, Bartholin's glands, and the cervix. Of these the cervix is the most important. The gonococcus finds an ideal location in the deep, poorly oxygenated recesses of the racemose cervical glands. The infection may be confined to these areas and never give rise to tubal inflammation. Not infrequently, however, immediately following menstruation, the gonococci ascend to the tube and give rise to salpingitis.

Microscopic examination of the extirpated gonorrheal tube shows it to be primarily an endosalpingitis, in which the tubal villi bear the full brunt of the disease. In early acute cases (primary attack) the folds become markedly swollen with polymorphonuclear leukocytes. Pus appears in the lumen of the tube. In early cases the muscularis and serosa are little inflamed. At a later stage the inflammation travels from the lumen outward to the serosa. With resolution the exudate in the lumen and the folds is gradually absorbed, and on gross and microscopic study the tube

may appear normal. Not infrequently, however, the endosalpinx is found to be the seat of a follicular salpingitis, the end result of a mild infection. Repeated attacks cause marked thickening and infiltration of all the layers of the tube, although again it is the endosalpinx that is most severely inflamed.

From microscopic examination it seems reasonable to assume that the mode of extension in gonorrheal infection is via the surface epithelium or possibly the subepithelium. The sequence of extension is endocervicitis, endometritis, and endosalpingitis. The existence of an acute and subacute gonorrheal endometritis has been demonstrated by a number of investigators. Werthem,⁸ in the days when acute gonorrheal cases were operated upon, was able to culture the gonococcus from the endometrium in 8 of 18 cases. A most careful bacteriologic and histologic study was reported by Curtis.⁹ Of 46 women with a history or gross evidence of any pelvic infection, the gonococcus was recovered in 6 instances. Definite histologic evidence of subacute endometritis as evidenced by polymorphonuclear and round-cell infiltration was also present in these 6 cases. Two additional facts are noteworthy. (1) In spite of the fact that all patients were believed to be free of any active infection at the time of operation, 6 cases gave a positive gonococcic culture, (2) in all patients with positive cultures from the

minimal surgery, owing to a primary mistake in diagnosis

End Results (Chart 3)—Of the 350 patients 70.3 per cent were observed in the follow-up clinic for a period varying from four months to five years. The results on the 256 patients seen were classified in these groups

1 **Anatomic**—Cured 78 per cent, improved 21 per cent, failures 2 per cent. Any palpable masses (ovarian or tubal), retroversion, or persistent induration were classified as improved or failures, depending upon the degree of pathology present. It is reasonable to expect that in many cases complete resolution may never be obtained or only at a late date.

CHART 3

2 **Clinical**—Cured 85.5 per cent, improved 13 per cent, failures 1.5 per cent. The chief clinical complaints are pain and irregular bleeding. Frequently, leukorrhea necessitated treatment in the endocervicitis clinic, but leukorrhea continuing after treatment was considered to militate against the desired clinical result.

3 **Economic**—Cured 87.8 per cent, improved 11 per cent, failures 1.2 per cent. This is believed to be the most important criterion of the success or failure of cornual resection and it is gratifying that only 3 of the 256 patients who were traced felt that they were unable to work following this operation.

4 **Reoperations**—To our knowledge no

Postoperative Hospitalization

CHART 4

patient has been reoperated upon in any hospital, municipal or private, for a recurrence of the salpingitis. Because of the economic status of these patients it is likely that further treatment would be sought in a municipal hospital. However, there has been no request for information concerning these patients. Three patients were reoperated upon on the gynecologic service at Harlem Hospital. In 1 patient, a laparotomy for upper intestinal obstruction was performed. Examination of the pelvis showed it to be clear. In 2 other patients, laparotomy was performed for persistent pain. In both, a Poole suspension of the ovaries had been performed, and apparently the fixation of the ovaries caused tension and pain. The tubes were excised in both instances at reoperation. A small hydrosalpinx, measuring 1 cm in diameter, was present in 1 case, in the other, the tubes were microscopically and macroscopically normal.

Conclusions

1 The sequence of extension of a gonorrheal infection is endocervicitis, endometritis, and endosalpingitis.

2 Cornual resection is offered as a simple operation for the clinical cure of recurrent salpingitis by severing the continuity

Distribution by Age

CHART 1

per cent positive for bacteria. In all of these cases the temperature, sedimentation rate, and white blood count had been normal for two to three weeks before operation. In 11 of the 16 cases gonococci were found five times as the sole organism. In the remaining cases a variety of organisms—streptococci, staphylococci, colon bacilli, diphtheroids, etc—were present. The pus in the lumen of the tube was sterile. Notwithstanding these bacteriologic findings, the original deduction—namely, that the tube does not spontaneously reinfect itself but that reinfections invariably proceed from the lower genital tract—still seems to be valid. To our knowledge there has been no case of recurrent infection of the tube following cornual resection. At the present time, further bacteriologic and immunologic studies are being made to determine why reinfection of the tube does not occur from the bacteria present in the tube wall itself, this would seem to be due to bacteriostatic tissue factors of which almost nothing is known at present.

Clinical Material

To date, over 400 cases of cornual resection have been performed at Harlem Hospital. The following report is based upon 350 cases operated upon during the period from March, 1934, to November, 1939, so that a minimum follow-up observation of four months has been obtained.

Age (Chart 1)—The youngest patient was 17 and the oldest was 49 years of age, 248

cases were between 20 and 29 years of age. Despite the apparent youthfulness of this group, they all had had repeated attacks of salpingitis. No patient was operated upon during the first or second attack.

Preoperative Hospitalization (Chart 2)—Before any surgery was instituted Simpson's prerequisites were satisfied. This required from one to four weeks of preoperative hospitalization in the majority of the cases, not infrequently, five to six weeks was necessary. In 20 cases, as a result of a diagnostic error (ectopic, twisted ovarian cyst, etc), the operation was performed within four days of hospitalization.

Preoperative Hospitalization in Days

CHART 2

Size of Tube at Operation (Chart 3)—In 185 patients the tubes were less than 2 cm in diameter, in 121, from 2 to 4 cm in diameter, and in 44, over 4 cm in diameter.

Postoperative Morbidity (Chart 4)—Three hundred and six or 87.4 per cent of the patients were discharged from the tenth to the sixteenth postoperative day. As in other reported series (Ricci,²⁷ Aldridge²⁹) there was a marked correlation between the acuteness of the salpingitis at operation and the postoperative morbidity. The greatest postoperative morbidity occurred in those patients who had had the shortest preoperative hospitalization and where the operation was not one of choice but one of necessity or a desire to perform

SARCOMA OF THE UTERUS

FRANK R. SMITH, M D, F A C S, New York City

UTERINE sarcoma is a malignant tumor consisting of cells of mesodermal origin. These tumors are usually classified quite properly according to their origin and pathologic characteristics. Most authors attempt to identify them as originating from endometrial or myometrial tissues, with subdivisions according to their architectural structure. Ewing¹ describes uterine sarcomas as (1) circumscribed primary sarcoma, chiefly subserous or interstitial, (2) diffuse sarcoma, chiefly submucous or infiltrating the wall and parametrium with metastases and subject to hemorrhage and necrosis, (3) polypoid sarcoma of the body of the cervix (so-called botryoid sarcoma), (4) extensive single or multiple myosarcoma, and (5) secondary sarcoma in myomas. Frank² mentions as usual types muscle cell, spindle cell, round cell, giant cell, and those with secondary changes in myoma, also the special types—angiosarcoma, perithelial cell sarcoma, and melanosisarcoma.

This discussion will deal with the clinical manifestations of the disease, the therapy employed, and the results obtained. It is based on a statistical study of the patients with undisputed sarcoma of the uterus who have been treated on the Gynecological Service of Memorial Hospital during the years 1928 to 1939, inclusive. Twenty-four such patients were available. Four other patients were sent to Memorial Hospital during this period with the pathologic diagnosis of uterine sarcoma, but the diagnosis was not confirmed by our pathologic department. These patients will be referred to again but are not included in this statistical study. Also, certain other patients (infants) with angiosarcoma of the vagina and those with retroperitoneal sarcomas involving the entire pelvis are excluded from this study.

Table 1 shows the relative rarity of sarcoma of the uterus by comparing its incidence with that of other uterine lesions treated at Memorial Hospital during the same time period. Naturally, this comparative incidence will vary in different clinics. In discussing the relative frequency of sarcoma to carcinoma in the uterus, Frank² quotes Evans³ in stating

the incidence to be 1 to 40 and Veit⁴ as 1 to 37.2. Geist⁵ found 4.07 per cent sarcoma in 540 patients with myomas, Kelly⁶ reported 1.2 per cent sarcomas in 1,400 myomas. Warner⁷ states that of 7 per cent cellular myomas only 2 per cent were positive sarcomas. The relative incidence of sarcoma of the cervix to carcinoma of the cervix is stated by Meyer⁸ to be 1 to 29, by Gessner,⁹ 1 to 8.

Table 2 shows that sarcoma of the uterus occurs most frequently during menopausal and early postmenopausal age periods.

Table 3 presents a possible connection between parity, abnormal menstruation, and sarcoma of the uterus. Over half of these patients had had no pregnancies, 8 had completed the menopause (1 at 33 years of age), 1 (57 years old) with congenital absence of the vagina had never menstruated, 4 of the married women without pregnancies had had extremely irregular periods.

Table 4 indicates how infrequently the diagnosis of sarcoma is correctly made, clinically, before a biopsy has been taken.

Table 5 suggests the stage of the disease when the patients were received at Memorial Hospital. Only 5 patients (20.8 per cent)

TABLE 1—INCIDENCE OF UTERINE SARCOMA TO OTHER UTERINE LESIONS AT MEMORIAL HOSPITAL, 1928-1939

Diagnosis	No Patients	Incidence

THE DOCTOR IN UNIFORM

Military service has a strange effect on most physicians, said Dr Creighton Barker, of New Haven, addressing the Connecticut Hospital Association a few weeks ago. It causes them, he remarked, to suffer from what another has lately called a "cactus complex," which "is a bristling thorny untouchability usually accompanied by several stigmas, small shoebrush mustaches, grapelike pendulous tumors dangling from the left wrist, and a dermatosis resembling a small watch hidden by the cuff." All these are intermittent sources of irritation producing sudden jerky movements, usually crooking of the elbow and frequent nervous inspection of the wrist to see what time it is for no reason at all. Our

usually mild and quiet colleagues, as soon as they put on a uniform, will develop the idea that to be consistent they must develop a certain fierceness and barking speech and heel-clicking smartness. A brief course in deportment is suggested while there is yet time. I submit, too, that tailors should be more carefully controlled. There is something comfortable and confidence-inspiring in a family physician whose bedside raiment is characterized by a wholesome indifference, but this same man, distorted, compressed, and caused to bulge in a uniform that has been designed and sewed under the influence of war hysteria, cuts a figure that is bad for the morale of the old regiment.

EXAMINATIONS—AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY

The general oral and pathologic examinations (Part II) for all candidates (Groups A and B) will be conducted at Cleveland, Ohio, by the entire board from Wednesday, May 28, to Monday, June 2, 1941, inclusive, prior to the opening of the annual meeting of the American Medical Association in Cleveland.

Formal notice of the time and place of these examinations will be sent each candidate several weeks in advance of the examination dates.

Candidates for re-examination in Part II must

make written application to the Secretary's Office before April 15, 1941.

The board requests that all prospective candidates who plan to submit applications in the near future request and use the new application form which has this year been inaugurated by the board. The secretary will be glad to furnish these forms upon request, together with information regarding board requirements. Address Dr Paul Titus, secretary, 1015 Highland Building Pittsburgh (6), Pennsylvania.

NOTICE OF TWO LECTURES

The New York Polyclinic Medical School and Hospital wishes to announce the following:

Dr Walter C Alvarez of the Mayo Clinic will deliver a lecture on Friday, April 18, at 2 30 P.M., on "Puzzling Types of Abdominal Pain."

Dr Ralph Moore Tovell, Hartford Hospital, Hartford, Connecticut, will deliver a lecture on Friday, May 2, at 5 30 P.M. on "Regional Anesthesia."—F H Dillingham, M D, Medical Executive Officer.

received a total of 80,000 milligram hours. Three of these also received gold seeds or applicators. The roentgen therapy is outlined as to methods and dosage used in Table 10A. Two of these patients also received 2,000 r to the ribs and chest lesions, and 1 patient received 750 r to a pathologic fracture of the left femur. In view of the fact that clinical regression of the disease did not occur in any of these patients, no one of the methods of therapy here used can be considered superior to the others. Since 6 of the patients treated by x-rays and the 6 treated with the element radium pack are known to have received all the therapy that can be given by the methods used without serious normal tissue damage, it must be assumed that sarcoma of the uterus is not sensitive to radium or to x-rays in a comparative sense. Possibly, with further development or with variation of the several therapy factors, such as use of the million-volt machine, a more optimistic estimation may replace the present pessimism as to the futility of irradiation therapy for sarcoma of the uterus.

The complications here considered (Table 11) express the tendency of extension and metastases. It has been previously shown^{10, 11} that vaginal fistulas are more often the result of extension of the disease than of the effect of irradiation therapy.

Lung metastases were the ones most frequently encountered (Table 12). It is to be noted that 6 of the patients did not have chest plates taken.

Table 13 shows no patient to have lived more than four years. While a variety of doses of irradiation have been used, no patient under the method used has shown enough response to encourage any optimism as to the radiosensitivity of sarcoma of the uterus.

Of the 4 patients sent to Memorial Hospital as having sarcoma (cases disputed by our pathologic department), 2 received treat-

ment and 2 were not treated, but all 4 are alive and free from disease more than four years (1, six years). It must be assumed that they did not have sarcoma.

In studying the 6 patients who are still alive, it is of interest to note that only 1 had not had some operative procedure before coming to Memorial Hospital. That case was thought to be a carcinoma of the corpus uteri and was so treated, i.e., 750 r were given to four pelvic portals and two weeks later 4,000 millicurie hours were administered by the insertion of a corpus string into the uterine cavity. At this time the biopsy (Fig 1) obtained with a curet proved to be a sarcoma of the endometrial type, five months later the hysterectomy (Fig 2) showed necrosis of the tumor but with a considerable amount of active tumor tissue still present. This patient has remained well for twenty-two months.

Figs 3 and 4 show a similar uterus of the endometrial type treated by the author, by hysterectomy alone, at another hospital (no radium or x-rays at any time), and the patient had no evidence of the disease four and a half years later.

The 2 living patients who are alive and free of evidence of the disease thirty months from their admission to Memorial Hospital each had simple removals of cervical and vaginal

had not been operated upon at least once before coming to us for treatment

Table 6 indicates the possible association of sarcoma with congenital maldevelopment and with uterine fibromyomas. One patient developed basal cell carcinoma of the face eighteen months after her hysterectomy for sarcoma, and she is being treated for the basal cell carcinoma by irradiation.

Table 7 tabulates the first symptoms noticed by these patients. While bleeding is the predominant first symptom, it should be noted that pain was noticed first by only one-fifth of the patients and that pain alone or associated with some other symptom was noticed by only one-third of this group. Since pain is always a late symptom of uterine malignant tumors and since ascites (also an advanced symptom) was first noted alone or with some other symptom by only one-third of the group, one cannot assume that a large portion of these patients were in the advanced stage of the disease when they were first seen at Memorial Hospital. This need not necessarily infer delay in diagnosis or neglect to institute prompt therapy, but it does suggest the rapidity of progress and development of the disease.

Table 8 with its presentation of the brevity of symptoms indicates the rapidity of progress of the disease from the time of the first

symptom, for more than two-thirds had symptoms for less than six months and only 2 patients had any symptoms for as long as one year.

In considering the significance of the size of the uterus-containing sarcoma (Table 9), it must be remembered that 14 patients in this series were known to have associated myomas. However, these rapidly growing tumors are known to attain large dimensions in a short period of time.

Table 10 shows the treatment received by these 24 patients at Memorial Hospital. All patients were treated by x-rays or by the 4-Gm radium element pack. Nine received both x-rays and radium (gold seeds or intra-uterine applicator). The 6 patients who were treated with the element pack each received 160,000 milligram hours administered at 15 cm distance, 8,000 milligram hours being given daily to one field, alternating between the anterior and posterior fields, each of which

factor in sarcoma of the uterus. The high incidence of associated myomas may also be significant in this respect.

3. The possibility of cellular but benign myomas being called sarcoma must be considered in any reported series.

4. The rarity of clinical diagnosis before biopsy, the absence of symptoms of advanced stage of the disease when diagnosed, the brevity of symptoms, the size of the uterus, and the early, fatal termination, all point to the rapidity with which growth and metastases take place.

5. Surgery is still the least harmful method of therapy for sarcoma of the uterus. It is only suitable for the stage if, and when, the disease is limited to the uterus. Postoperative external irradiation, to date, has shown no effect on the disease to justify its continuation with the present methods employed. Possibly further developments in technic will necessitate a reversal of this opinion.

OLD DR. KILDARE GOES INTO PRACTICE

Picked by J. P. S. from a movie magazine

Having been a medicine man in six Kildare pictures, you can bet your bottom dollar that Ayres hasn't been asleep on the job. He has read the *Materia Medica* through twice, has romped through a library on surgery, and when last heard from was mastering the latest whimsies in the art of diagnosis. One of the Hollywood legends is that once Dr. Lew walked up to a total stranger, talked to him five minutes, and informed him gently that he was suffering from a brain tumor. His hunch proved right.

So studious is Ayres about his role of James Kildare, M.D., that he has haunted hospitals to check up on physicians' habits, has talked with interns until wee hours in the morning, has watched operations by the dozen, and has even compared his bedside manner with those of established practitioners.

—J.A.M.A.

LECTURES ON HEMORRHAGE

Dr. Albert F. R. Andresen, of the Department of Medicine of the Long Island College of Medicine, has arranged a course of lectures on hemorrhage for the St. Lawrence County Medical Society—Ogdensburg, New York, 12:30 P.M.—and for the Jefferson County Medical Society—Watertown, New York, at 6:30 P.M.

March 27 "Hematuria," Dr. John J. Bottone, clinical professor of urology, Brooklyn, April 3 "Gastrointestinal Hemorrhage," Dr. A. F. R. Andresen, professor of clinical medicine, Brooklyn, April 10 "Uterine Hemorrhage," Dr. Harvey B. Matthews, clinical professor of obstetrics and gynecology, Brooklyn, April 17 "Pulmonary Hemorrhage," Dr. Richard H. Bennett, clinical professor of medicine, Brooklyn, April 24 "Hemorrhages of Pregnancy," Dr. Mervyn B. Armstrong, assistant clinical professor of obstetrics and gynecology, Brooklyn.

Kentucky is losing physicians. In 1914 it had 3,621, in 1939 only 2,236. Two counties have but one each. Its only medical school is of the first grade but does not graduate enough men to meet the shrinkage.

The Annual Spring Clinical Day of the University of Buffalo Medical School will be held at the Hotel Statler, Buffalo, April 5, 1941. The program consists of six nationally known speakers and a group of thirty exhibits.

FIG 1 Sarcoma of the uterus

FIG 2 Sarcoma of the uterus

FIG 3 Sarcoma of the uterus

tient has had a complete disappearance of the lesion. However, the 2 patients in the group now dead who lived forty-eight months each were treated in a similar manner and in addition had heavy external irradiation with the 4-Gm radium element pack (160,000 milligram hours at 15 cm), and both eventually died of the disease. It is of interest in view of the recent report of Amolsch¹² that none of these polyps showed myxomatous tissue.

It would seem that the best treatment for sarcoma of the uterus is complete hysterectomy, with any hope for cure to depend on the rare, early, accidental discovery of sarcoma, as well as on the type encountered. Certain cases that had a small cervical stump remaining have been treated because of the clinical appearances of recurrence in the stump, but the biopsy reports in all but 1 case have been shown to be merely chronic cervicitis. In view of the findings, postoperative external irradiation or the local treatment of a cervical stump is not justified without positive evidence of the disease.

Conclusions

1 While the dangers of drawing too positive conclusions from the statistical study of so small a group (24 patients) are recognized, the relative rarity of uterine sarcoma incidence as compared with the incidence of other uterine lesions seems to justify this study.

polyps which were shown to be myosarcoma. One of these had an incomplete removal of the polyp. One biopsy of the base of the polyp showed myosarcoma, and, after completion of removal of the polyp and insertion of gold seeds (1,125 millicurie hours), the pa-

LABORATORY AIDS IN THE DIAGNOSIS OF BACTERIEMIA

Bacteremia, the presence of bacteria in the blood stream, may be a transitory and clinically inconspicuous sequel of such procedures as instrumentation of an infected urinary tract or surgical intervention in an area of infection. In a second group of conditions, bacteremia is a frequent incidental occurrence, for example, in typhoid fever, pneumonia, undulant fever, meningococcal meningitis, and gonorrheal arthritis. A third group comprises cases in which bacteremia and its consequences dominate the clinical picture. Such cases are designated sepsis (the term septicemia is often used synonymously), most of them are found in one or another of the following categories grouped according to primary focus and portal of entry

(A) Otitis media and mastoid infection, with or without meningitis these conditions give rise to numerous cases of sepsis. The microorganisms most commonly found are hemolytic streptococci, pneumococci, and staphylococci. (B) Carbuncles, furuncles, and cellulitis sepsis following these infections is generally due to staphylococci or hemolytic streptococci, the case fatality rate is high. (C) Osteomyelitis here again hemolytic streptococci and staphylococci are the most frequent incitants. (D) Post-partum and postabortion infections hemolytic streptococci, nonhemolytic anaerobic streptococci, and staphylococci are the microorganisms most frequently isolated from the blood of patients with puerperal sepsis. (E) Urinary tract and biliary tract infections the colon bacillus, staphylococcus, and streptococcus are the usual infectious agents. (F) Throat infections occasionally a hemolytic streptococcal throat infection gives rise to severe or even fatal sepsis. (G) Cryptogenic sepsis in these

cases bacteremia may occur without any detectable primary focus or portal of entry. At the outset the condition is often mistaken for rheumatic fever. Staphylococci, hemolytic streptococci, occasionally pneumococci, and, rarely, various other microorganisms may be the incitants. (H) Bacterial endocarditis this is a special form of sepsis in which bacteria are swept into the blood stream from infected thrombi on the heart valves. The microorganisms most commonly isolated from blood cultures are *Streptococcus viridans*, hemolytic streptococci, pneumococci, and staphylococci.

Clinical and experimental studies seem to justify the following statements in regard to bacteremia. (1) Except in the terminal phases there is little or no multiplication of bacteria in the blood stream. (2) The symptoms most suggestive of blood-stream invasion are chills, sweats, quick rises and abrupt falls of temperature, hemorrhagic or pustular skin lesions, and progressive anemia. (3) Since bacteremia is frequently intermittent, repeated blood cultures may be necessary to establish the diagnosis. Special media or special conditions of incubation, such as anaerobiosis or an atmosphere containing 10 per cent of carbon dioxide, may be required for the growth of certain species of bacteria. (4) From the point of view of therapy, the advent of the sulfonamides makes the early recognition of bacteremia of even greater importance than heretofore.

In addition to blood cultures and cultures of primary foci of infection, blood counts to determine the presence or absence of leukocytosis and anemia, and cultures of the urine and of skin lesions may yield data of value.—Issued by The New York State Association of Public Health Laboratories, Leaflet No 16

NATIONAL DEFENSE AND VENEREAL DISEASE CONTROL

The private practitioner has an important part to play in venereal disease control to aid national defense, says a statement issued by Assistant Surgeon General R. A. Vonderlehr urging physicians to read the monthly publication, *Venereal Disease Information*, published by the United States Public Health Service at 50 cents a year.

"During the World War, venereal disease in the Army caused the loss of almost 7,000,000 days—equal to a full year's absence from duty for 19,000 men," Surgeon General Thomas Parran points out. "Infections among military personnel originate in the civilian communities. Recent experience indicates that the venereal disease rate in a given military command reflects the efficiency of the venereal disease control program in adjacent communities. The same is true for industrial defense concentrations

"Effectively carried out," Dr Parran emphasizes, "the eight-point cooperative program will contribute substantially to the physical fitness of men in the armed and industrial defense forces and should be of far-reaching importance to the future control of venereal disease. But this must be a cooperative program between health officers, military authorities, police agencies, citizens, and private physicians."

Venereal Disease Information presents a monthly digest of the important papers on diagnosis, treatment, pathology, laboratory research, and public health from the entire world. In addition, it publishes important special papers and reports by leading scientists. It is designed to keep both the specialist and the general practitioner informed of developments in clinical management and public health control of syphilis, gonorrhea, and the venereal diseases.

Case Report

TULAREMIA

WALTER FOX SMITH, M D , and JOHN M RICE, M D , Watertown, New York

TULAREMIA has not been reported previously in the northern part of New York State in wild animals. The infecting animal, a wild rabbit, in this case was shot at Point Peninsula, Jefferson County, New York. Point Peninsula is an extremely isolated section lying between Lake Ontario and Chaumont Bay and is almost completely surrounded by water. This case is reported not because of any unusual feature but to call attention to this infection in northern New York State, since unquestionably there will be further cases.

Case Report

A 27-year-old man dressed a wild rabbit shot October 16, 1939, at Point Peninsula, New York. While cleaning the animal he nicked the skin of both index fingers. His companion who actually shot the rabbit opened it and gave the liver to his dog. He did not notice any abnormality in the liver, nor did he become infected in spite of getting the rabbit's blood on his hands.

Forty-eight hours after cleaning the rabbit, the patient suddenly felt feverish, dizzy, chilly, and nauseated. His temperature was elevated to 102 F. The next day he noticed that both index fingers were tender and swollen at the site of the tiny lacerations. Also he had tender swellings in both axillae. His temperature continued high, averaging about 103 F. He complained of upper abdominal and lower chest pain much of the time. He did not improve at home for seven days and was sent for diagnosis to the Mercy Hospital at Watertown. At time of admission his temperature was 104 F and he was complaining of sore index fingers and upper abdominal and lower chest pain.

The physical examination showed an acutely ill man. There was no cyanosis, jaundice, or dyspnea, nor were any eruptions noted. The eyes showed marked photophobia, the pupils were equal and reacted to light and accommodation, and extraocular movements were normal. The nose and ears were normal, the tongue was coated, and the throat was not inflamed. There was no rigidity of the neck, and the cervical glands and thyroid were not enlarged. There was no deformity of the chest. Respirations were normal, percussion and breath sounds were normal, and there were no rales or friction rub. The heart was not enlarged to percussion, was regular, and had no murmurs, sounds were of good quality, the rate was 96. The abdomen was slightly distended and tender across upper part, there was no muscle spasm, and the liver and spleen were not felt. On each index finger there was a pustule covered with necrotic skin and a seropurulent discharge. In both axillae there were several tender enlarged lymph nodes the size of a chestnut. They were firm but not fluctuant. The reflexes were normal.

Course—On day of admission to hospital a

tentative diagnosis of tularemia was made, and material from lesion on fingers was injected in a rabbit. Admission blood count showed a leukocytosis of 18,400 with 82 per cent neutrophils. Blood culture, Widal test, stool culture, and agglutination for undulant fever were all negative. His temperature continued high, with an occasional drop followed by a chill with fever quickly returning. His general condition seemed to be weaker, and he complained of dyspnea along with the upper abdominal and lower chest pain. In view of reported success with sulfanilamide in treatment of tularemia, he was given this medication. Temperature remained elevated and general condition poor in spite of large doses of the sulfanilamide. He was given 60 grains followed by 15 grains every four hours. This was discontinued three days later as he had shown no improvement and was cyanotic and dyspneic.

On the fifth day after inoculation the rabbit died, and postmortem showed typical findings of tularemia, i.e., hemorrhagic edema at site of inoculation, caseous regional lymph node, and small foci of necrosis throughout the liver and spleen.

Antigen for agglutination tests was obtained from the New York State Department of Health. On the eighth day of illness this was positive in dilution 1:120, on the sixteenth day, 1:320.

On the twelfth day of his illness sulfapyridine was started in following dosage: 4.0 Gm for the first dose, then 2.0 Gm every four hours. His temperature gradually fell during the next thirty-six hours until it was normal, and he felt markedly improved. At this time he began to vomit every dose, and it was discontinued by mouth and given 1.0 Gm every four hours rectally for twenty-four hours. During this day his temperature rose to 104 F. Nausea and vomiting ceased and medication was resumed by mouth 1.0 Gm every four hours. The temperature fell to normal within twelve hours and remained so. Tenderness in axillary nodes and pain in upper part of the abdomen and lower part of the chest disappeared at this time.

Because of the time element, the average duration of fever being between two and three weeks, it is difficult to judge the effect of the sulfapyridine. However, the rapid improvement coincident with the administration of sulfapyridine would suggest further trial.

He was discharged from the hospital on November 16, 1939, at which time temperature had been normal for ten days. The lesions on his fingers were well healed but still had some axillary lymphadenopathy.

Summary

1. A case of tularemia in a man who dressed an infected wild rabbit shot in Jefferson County, New York, a district in which tularemia has never before been reported.

treatment of arthritis a few years ago, and I have here some statements that I then made from a careful reading of the literature. I should like to read just three or four of them. "I know of few subjects in therapeutics which seem to be in a more unsettled and unsatisfactory state than the treatment of arthritis. It does not seem possible to chart the progress in this field by other than a horizontal line with repeated spikes representing new therapeutic ventures. The rise of the spike represents the 'passive faith' which is so common a reaction to new agents or procedures and the fall of the peak represents 'aggressive skepticism.' In few therapeutic fields do we find such sharp contrasts of views concerning matters which should be matters of fact. One arthritis specialist working with a new compound reports dramatic results and another complete failure."

I have here another statement that was made by an outstanding authority on arthritis. "Drugs can be quickly dismissed, iron for anemia, arsenic and strychnine for their tonic effects, and salicylates to ease pain, and that about covers it." That statement was made in 1933. Where do we stand at the present time on the question? We ought to get some idea about this in the course of the discussion this morning. Perhaps it would be a good plan to catalog what is to be said under three or four questions. First of all, do any of the agents that I have listed or any others affect the cause of arthritis, whether it is a known or unknown cause? Second, do they alter the structural changes in the muscles and joints? Third, do they control symptoms? Finally, do they ever effect a cure?

Dr Russell L. Cecil will begin the discussion.

DR RUSSELL L. CECIL. We usually define rheumatoid arthritis as a chronic disease of the joints characterized in the early stages by pain and swelling of multiple joints and in the later stages by ankylosis and deformity.

This condition which we call rheumatoid arthritis is a real disease. I mean it is recognized as such by pathologists and clinicians. They look upon rheumatoid arthritis as a disease with not only a definite pathology but with also a definite clinical syndrome. There has been a tendency to catalog a good many nondescript forms of joint pain under the heading of rheumatoid arthritis, and this error is made even in arthritis clinics.

No arthropathy should be called rheumatoid arthritis unless it fulfills certain criteria. The important criteria are first of all *swelling* and *pain of several joints*. Personally, I like to see,

sooner or later, one or more fusiform fingers, and these may come early or late in the disease. Sooner or later a patient with rheumatoid arthritis usually develops a fusiform finger or two. Then comes the swelling of the knuckles and wrists. The hand tells the story in most cases. With this swelling of several, often symmetrically distributed, joints, we practically always find an increased sedimentation rate. In cases with minimal swelling there is usually a minimal increase in the sedimentation rate. In about 75 per cent of cases, as pointed out originally here at Cornell by Nicholls and Stainsby, the patient's serum gives a specific agglutination reaction with the hemolytic streptococcus. This test is of value but of not so much practical importance as the sedimentation test because it is not so constant. We do not know what it signifies. It was thought this reaction signified a hemolytic streptococcal infection, but that has not been proved. However, we must still classify this disease as a low-grade chronic infection of unknown etiology.

In approaching the treatment of rheumatoid arthritis, why don't we first throw out a few procedures that modern students of arthritis have pretty well abandoned? For example, I think we can say at once that focal infection is very much on the wane. How we used to struggle and search for foci in the days gone by! I do not mean to say that focal infection should be disregarded altogether, but when I speak of focal infection I am limiting my remarks to its relation to rheumatoid arthritis.

In respect to rheumatoid arthritis the theory of focal infection is generally discredited because students of arthritis have found first, that in a great many patients the disease develops without any association with foci and, second, that those who have had foci of infection removed have obtained only temporary benefit, if any at all. The disease goes on its progressive course, even after tonsils, teeth, and other suspected organs have been removed.

There are certain other fads in treatment which have come and gone, such as bee venom and various forms of foreign protein therapy, sulfur, and many other drugs such as iodides, salicylates, etc. Streptococcus vaccine is still used extensively although it is not so popular now as it was a few years ago. While I have never been a strong advocate of vaccine therapy for the treatment of rheumatoid arthritis, we have used it extensively in our clinic work for many years. I have never felt,

CONFERENCES ON THERAPY

THESE are stenographic reports, slightly edited, of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and the New York Hospital, with collaboration of other departments and institutions. The questions and discussions involve participation by members of the staff of the college and hospital, students, and visitors. The next report will appear in the May 1 issue and will concern "The Sulfonamide Drugs."

Treatment of Rheumatoid Arthritis

DR HARRY GOLD The conference this morning is on the subject of the treatment of rheumatoid arthritis.

I am not sure that we all have the same understanding of the term rheumatoid arthritis. I have put a list of the various forms of arthritis on the board as a guide and perhaps the speakers will be able to set us right on just what one or ones of these forms of arthritis we are treating this morning.

Types of Arthritis and Rheumatoid Conditions

- 1 Atrophic or proliferative arthritis (rheumatoid)
- 2 Hypertrophic or degenerative arthritis (osteoarthritis)
- 3 Myositis or fibrositis and other conditions
- 4 Arthritis in childhood
- 5 Gonorrheal
- 6 Acute rheumatic fever
- 7 Traumatic arthritis
- 8 Tuberculous arthritis
- 9 Suppurative arthritis
- 10 Typhoid arthritis
- 11 Pneumococcal arthritis
- 12 Charcot's joint
- 13 Back pain
- 14 Sciatica and lumbago
- 15 Intermittent hydroarthrosis
- 16 Gout

I have also a list of the more common agents that have been recommended by various writers at various times for the treatment of arthritis.

Treatment of Arthritis

- I General
 - 1 Rest
 - 2 Foci infection
 - 3 Diet
- II Physical therapy
- III Orthopedic procedures
- IV Vaccines and nonspecific proteins
- V Drugs
 - 1 Arsenic
 - 2 Iodine

- 3 Salicylates
- 4 Cinchophen
- 5 Aminopyrine
- 6 Quinine
- 7 Digitals
- 8 Strychnine
- 9 Cod-liver oil
- 10 Vitamin D
- 11 Liver extract
(Vitamin B complex)
- 12 Vitamin C
- 13 Nitrites
- 14 Ortho-iodoxybenzoic acid
- 15 Bee venom
- 16 Colloidal sulfur
- 17 Sulfanilamide
- 18 Colchicine
- 19 Acetyl-B-methylcholine
- 20 Endocrine materials
(Pregnancy)
- 21 Radium
- 22 X-ray treatment
- 23 Laxatives
- 24 Mineral waters
- 25 Local injections
- 26 Therapeutic jaundice
- 27 Dehydration
- 28 Intravenous alterative therapy (salicylates, iodides, colloidal sulfur)
- 29 Autochemotherapy
- 30 Gold salts

There are thirty agents as you see. That list I am sure is not complete. I have also listed the other general measures that one encounters in any complete treatise on the therapy of arthritis, although I do not think we are going to do very much today with these forms of treatment but will confine ourselves more particularly to the question as to what one can do with drugs in the treatment of arthritis.

There are several very satisfactory reviews of the therapy of arthritis. There is one by Pemberton in 1930, another good review by Miller in 1935, and by Hench and his collaborators in 1936 and 1938.

I summarized the prevailing views on the

Arthritic patients can go on taking aspirin day after day without any apparent injury

Iodine and arsenic have been used for a good many years in the treatment of arthritis, but we do not make much use of either in the modern treatment of this disease. The iodides are used more in hypertrophic arthritis but rarely in the rheumatoid type.

I want to say a few words about gold therapy. One could take up the whole hour with this subject because it is new and important and is being much discussed. It is not so new as a matter of fact, because Forestier first began working with gold in 1929 and made his first report in 1931. He got his idea, strangely enough, from a theory that he and other Frenchmen had that rheumatoid arthritis was a form of tuberculosis of the joint, and, as gold had been used in the treatment of tuberculosis, Forestier conceived the idea of trying it in arthritis. At first he worked with sodium-gold-thiosulfate, later with sodium-gold-thiomalate. After his favorable report appeared, gold was taken up by other French and English investigators, and since then a number of studies have appeared in the literature. Thus far there has been little experimental study of the subject, such as the mode of action, gold content of the blood, and mode of excretion. These problems are now being attacked in this country. It appears likely that gold acts as a bacteriostatic agent. There was a theory, at one time rather popular and advocated by Kling and others, that gold salts act by stimulating the reticulo-endothelium. This was a rather fanciful idea, but certain investigators felt that there was some evidence to support it. At any rate, the general belief now in this country is that gold salts act by inhibiting the growth of the agent—whatever it is—that causes the disease. You might ask: How did they arrive at this conclusion? They reasoned by analogy. Such studies as those of Drs. Angevine, Rothbard, and others on animals infected with streptococci, pleuropneumonia-like organisms and other bacteria show that gold salts exert an inhibitory effect on the growth of the bacteria, both *in vitro* and *in vivo*.

Quite a number of gold salts have been used. One of the most popular is sodium-gold-thiosulfate, which has been employed extensively in this country. Another popular gold salt and one that we have used a great deal in the Cornell clinic is sodium-gold-thiomalate (myochrysan). Another is aurothioglucose, usually referred to as solganal, B. All of the efficacious gold salts contain a sulfhydryl radical. The

ordinary gold salts, such as gold chloride or even colloidal gold, are not beneficial in arthritis.

Gold salts are given either intravenously or intramuscularly. The oral method of administration does not seem to be effective. The dosage differs in different clinics. We usually begin with 10, 15, or 20 mg. and work up gradually to 100 mg. These doses are repeated once a week intravenously or intramuscularly (depending on the salt) until the patient has taken a total of 1 to 1.5 Gm. Most authorities are opposed to larger doses. The patient then gets a rest for six or eight weeks, some advocate an interval of even twelve weeks before a second series is started. Forestier says every patient should have at least two courses of gold, but, if the patient is not relieved by two courses, then gold is probably not going to help.

The most serious disadvantage of gold therapy is the prevalence of toxic reactions which sometimes are quite serious, but I think these reactions can in large measure be controlled by close attention to dosage and careful supervision of the patient. We have now treated more than 200 cases with gold without a single fatal reaction. We have seen 3 cases of rather severe exfoliative dermatitis and numerous instances of simple or squamous dermatitis. A number of patients have had ulcerative stomatitis, which is another common form of intoxication. We have encountered 2 cases of toxic jaundice. We have not had any cases of purpura hemorrhagica. They are being reported, however, and some of these have proved fatal. There have been a few deaths reported due to agranulocytosis.

I suppose that if we keep on using gold therapy long enough in our clinic we will eventually encounter a serious accident of some kind or another, just as happens occasionally with the administration of salvarsan, sulfapyridine, sulfanilamide, and other similar agents. I saw a death last spring in a rather mild case of pneumonia from purpura hemorrhagica following the use of about 40 Gm. of sulfapyridine. Time will not permit us to go into the matter of the toxic reactions in great detail. Sometimes immediate vasomotor reactions occur, such as dizziness, syncope, nausea, and vomiting. Most important is to watch the blood. We do blood counts on our patients once a month. Some clinics advise blood counts once a week. We inquire carefully about any tendency to hemorrhage. We watch the leukocytes and red cells, and we watch for signs of purpura.

however, that vaccine was the final answer to the treatment of rheumatoid arthritis.

We prefer to treat this chronic disease of unknown etiology along certain well-established principles, and I should say there are four of them.

The first is *rest*—not only of the body but of the mind and the emotions. Complete rest and relaxation and the elimination of all sources of anxiety and worry are essential. Many cases seem to come on after psychic shock or trauma. Rest of the affected joints is necessary. If the joint is particularly painful, it is often relieved by the application of splints for twenty-four hours or by the use of a sling or a crutch.

The second principle in the treatment of rheumatoid arthritis is *heat* in all its forms. I tell my patients that heat is their best friend and cold their worst enemy. Warm clothes, hot applications, the infrared light, and the paraffin bath are all helpful. The rays of the sun or the alpine light are used, of course, more for tonic purposes.

Hydrotherapy is beneficial for all arthritic patients, particularly when they begin to improve, not only for its stimulating effect on the appetite and circulation but for strengthening atrophied muscles. Hydrotherapy is an important form of treatment.

Warm climate is still popular but is disappointing in many cases because there is usually a relapse after the patient returns home.

Infrared light is a convenient form of heat therapy. Diathermy is not recommended in the treatment of rheumatoid arthritis as it often increases the pain. We use it in other forms of rheumatism.

The nature of the effect of heat is problematic. We assume, however, that heat acts by increasing the circulation in the joints, by having a general relaxing effect on muscular spasm, and by stimulating the mobilization of antibodies to the affected joints.

Fever therapy has a limited application in this form of arthritis. We use fever therapy chiefly in "active" cases. Fever therapy seems to be particularly helpful in patients with fever and hot, puffy, painful joints. In low-grade, chronic joints fever therapy does not seem to be of much benefit. It often gives these patients only temporary relief. In fact, that is the story of much of the therapy in rheumatoid arthritis.

The third principle in the treatment of rheumatoid arthritis is *rehabilitation*, and that, of course, covers many factors. It includes

iron therapy and transfusions for the secondary anemia which is almost constantly present in these patients. The diet, generally speaking, should not be a low-caloric diet as was once advocated. A well-balanced, high-caloric diet will tend to bring the patient's weight back to normal. A low-caloric diet should be used only if the patient happens to be overweight, but the diet should be one that appeals to the patient's appetite and maintains the vitamins and salts at a proper level.

Under rehabilitation we can also place corrective exercises which are important in the physical therapy approach to the disease. These are often given while the patient is in the warm pool or warm bath, or they may be given in connection with massage at the patient's home.

Exercise is extremely important not only to preserve joint movement but to prevent deformities. Exercises help to correct the tendency to flexion deformity which is such a characteristic feature of this disease. They make the patient feel better, improve the appetite, and help to build up the muscles which have a marked tendency to atrophy.

Massage is helpful during the convalescent stage, not so much so when the patient is in the active phase of the disease. Massage is limited to the muscles and is not used on the affected joints.

We should not fail to include as a part of rehabilitation the various orthopedic procedures that start with the correction or prevention of deformities. For example, in the case of flexion deformities we often use traction and corrective exercises, or splints may be applied during the sleeping hours and for part of the day. Finally, under *orthopedic measures* comes the use of corsets and braces for painful backs. Sometimes the surgeon operates on arthritic joints to correct deformities. The most popular operation is a synovectomy, which is indicated for a chronic villous arthritis—that is, a joint in which there is a marked hypertrophy of the synovial membrane. I have 2 patients now who have recently been synovectomized, and both are well pleased with the results. The orthopedic surgeons select these cases carefully and are not disposed to perform a synovectomy except on a boggy knee or elbow.

Now coming to *drug therapy*, we deal first with drugs that relieve pain. Under this heading we put salicylates first, and acetyl salicylate is the old standby. Most rheumatoid patients take a daily quota of it, anywhere from 40 to 60 grains or even more a day.

We occasionally do a platelet count to see whether or not there is any fall in the platelets. The urine must be examined once a month for kidney complications, although these are quite rare.

Rheumatoid arthritis is a disease from which one rarely gets well spontaneously. It is a disease that is usually progressive. Forester estimates that only 1 to 5 per cent of patients make a complete and permanent recovery. Remissions may last for five or ten years before the almost inevitable recurrence makes its appearance. Therefore, when we get hold of an agent like gold and see remissions in about one-third of our cases, we naturally get a little excited about it. We have never had a remedy that has given us such a high percentage of remissions with complete disappearance of swelling and pain in those cases that are not too far advanced. Even in individuals who have had the disease for several years, the pain and swelling diminish and the patient is often able to go back to work though he cannot be called completely cured. As a matter of fact, we do not use the word "cure" in this connection, in spite of the good results that we obtain with gold (one-third of the cases showing remissions and another third showing marked improvement). About one-third or more of our cases have had relapses. These patients have had complete remissions or marked improvement, but when we stopped the gold for a while to let them excrete a little of the metal and thereby prevent gold intoxication there has been a return of joint symptoms, usually within a few weeks or months after the last injection of gold. In other cases the relapse has occurred only after an interval of several years. Fortunately, the relapse is not so severe as the original attack, and the relapse also responds to gold treatment, though not always promptly.

On the whole, the outlook for gold therapy is quite promising. Students of arthritis, after being in a wilderness of pseudotherapeutic remedies for many years, are now beginning to approach a sort of "promised land", at least the patients think so, for nearly all of them say they feel better after gold treatment than after any of the other forms of treatment which had been used previously.

Where should the arthritis patient be treated? There are three clinical types. One is the acute or subacute type with pain and swelling and some fever, suggestive of rheumatic fever. This type of arthritis should be treated in the hospital. Then there is the mild, sluggish type which we treat in the

clinic or in the doctor's office. The third type is the advanced cripple who really needs sanitarium care. This patient can be made fairly comfortable either by sanitarium care or by special nursing in the home or hospital.

When we bring the rheumatoid patient into the hospital for treatment, we generally give him intensive physical therapy, perhaps some fever therapy, and several blood transfusions. He gets a nutritious diet and plenty of rest, which many of them need very badly. We put the patient to bed and he stays in bed a part of every day. On this regimen he soon begins to show real improvement, and then after six weeks, which is about the maximum hospital treatment feasible, he is discharged feeling much encouraged and more comfortable. Treatment is then continued either at home or in the physician's office.

DR GOLD: Dr Angevine, will you continue the discussion?

DR D MURRAY ANGEVINE: The fact that Dr Cattell has asked a pathologist to discuss this subject indicates that it is in not too healthy a state and, if it does not require an autopsy, at least a liberal biopsy is necessary. From Dr Gold's introductory remarks it appears as though he were putting Dr Cecil and myself on the spot. However, I do not think he actually intended to do so.

Dr Cecil has covered most of the important subjects, but I should like to mention a few things that are of importance in the treatment of this disease. I would first like to say something on behalf of the patient. The first patient who will come to you in practice will probably be without teeth and tonsils due to the energetic tactics of your medical confreres. The patient will have little use for doctors, so you see that you have a problem on your hands, and it is of the utmost importance that you immediately gain the confidence of this patient in order to keep him under your care long enough for adequate treatment.

In treating these patients either in the clinic or in the office the most important thing is to have sufficient time to listen to their problems and complaints. There is too great a tendency on the part of physicians to give them a pat on the back, an injection by a nurse, and to send them on their way. From experience in the clinic I have found that if you can devote sufficient time to these patients, as you do to others, they will be most appreciative and remain under your care over a period of many years.

They will do well under the type of therapy which Dr Cecil has mentioned—namely,

of their symptoms quite sharply after removal of foci. You always have to run that risk in taking out tonsils and teeth. The presence of hemolytic streptococci in tonsils would not excite me much. The tonsils are scavengers. They are just the places where streptococci ought to be. If you were to cut a tonsil open and get streptococci from the cut surface, that would be just what I should expect. If you got actual pus, that would be quite a different matter, of course.

DR. JANET TRAVELL. I should like to ask two questions. One is in connection with the sulfur content of these preparations. Dr. Cecil pointed out, I believe, that all of the commonly used gold salts contain a certain proportion of sulfur.

DR. CECIL. Yes, but not very high.

DR. TRAVELL. The sodium-gold-thiosulfate accepted by the A.M.A. Council on Pharmacy and Chemistry has been analyzed and contains about 25 per cent of sulfur and about 37 per cent of gold. Further, there is an experimental study in the literature by Japanese investigators on experimental tuberculosis of guinea pigs, and they found that treatment was just as effective if they used the salt after the gold radical had been removed but the sulfur radical had been retained. I wonder if there are any salts of gold in use in our clinic which do not contain sulfur?

DR. CECIL. Gold salts, to be effective, must contain a sulfhydryl group. This is known as Feldt's principle. Feldt's work was done several years ago, and he postulated that gold salts to be efficacious in animal experiments had to contain a sulfur radical. On the other hand, Freyberg's work at the University of Michigan proves pretty clearly that sulfur alone has no value in the treatment of arthritis.

DR. TRAVELL. The sulfur studies were not conclusive. It might be that a combination of gold and sulfur is needed.

DR. CECIL. Yes, there might be something to the combination.

DR. TRAVELL. I have another question in regard to sedimentation rates. Elman and Lawrence recently expressed enthusiasm regarding the use of the sedimentation rate as a guide to the effectiveness of therapy and also as a guide to the dosage. They report that they have greatly reduced the incidence of toxic effects by discontinuing therapy when the sedimentation rate returns to normal. I wonder if you would say something about that.

DR. CECIL. I should have spoken about the

sedimentation rate in more detail. The sedimentation rate is a great help to us in the use of gold therapy. It has been shown by numerous observers that when gold therapy is effective the sedimentation rate tends to return to normal. Occasionally we find cases that are greatly benefited by gold though the sedimentation rate remains high. On the other hand, even those who get a normal sedimentation rate sometimes relapse, and the sedimentation rate then rises again.

DR. TRAVELL. After you stop the gold?

DR. CECIL. Yes, in some patients a few weeks after you stop the gold the sedimentation rate will begin to climb either before joint symptoms have developed or simultaneously with the reappearance of arthritis.

We recommend that patients free from symptoms have a sedimentation test about every three or four months to determine whether or not the rate is remaining normal. As long as it is normal we feel that the patient is pretty safe. If a patient has had a remission after only one course of gold, I would give another course of gold even in the face of a normal sedimentation rate.

DR. TRAVELL. Then it is a valuable guide?

DR. CECIL. Yes, it is. It is a simple test, too, and easy to do.

DR. ANGEVINE. One of the reasons I am so skeptical of gold salts is that I have seen the kidneys and livers of many animals treated experimentally. Our early experiments showed that gold controlled the infection very well, but as the virulence of the organism increased gold became less effective. It was necessary to increase the amount of gold to control the infection. However, we soon produced some striking lesions in the kidney and liver. Perhaps, looking at it from this angle, one becomes more conservative than one who does not have the opportunity to observe the toxic effects directly.

DR. CECIL. The treatment of any disease of unknown etiology is always more or less irrational. I think if Dr. Angevine had arthritis he would take a little gold himself.

DR. CONNER. Dr. Cecil, have you not seen improvement follow the various other methods of treatment which have had a temporary popularity in the past?

DR. CECIL. Yes!

DR. CONNER. In the fever treatment or the treatment with vaccine?

DR. CECIL. Yes, but not nearly so frequently as with gold. The development of gold therapy in the United States is rather interesting. I do not know whether you are

Hence, often it is difficult to rule out the matter of coincidence in appraising the value of these various methods of treatment

DR McKEEN CATTELL Recent studies by Sidel and Abrams emphasize the difficulty in evaluating the results of therapy in arthritis. These investigators compared the results of intravenous polyvalent streptococcus vaccine with a series of controls in which saline solution alone was injected. Of 58 patients with chronic rheumatoid arthritis 33 were treated with saline injection, and 74 per cent of these showed definite improvement, a percentage slightly higher than was obtained in the remaining 25 patients receiving the vaccine. They concluded that the psychologic effect of the injection rather than the substance injected was the important thing. Evidently we must keep in mind the influence of the needle in evaluating therapy.

DR CECIL So far as my enthusiasm for gold therapy is concerned, I do feel that gold is giving us more in the way of successful therapy than anything we have worked with so far, and that is the present feeling in England and in other European countries. Whether it is the final answer or not I would not dare to say. We may get improvements in preparations of gold salts so that they will be less toxic and safer to use. When we finally determine the etiology of this disease, better agents than gold may be discovered, but at the present time I do feel that gold is the best thing available in the way of medical treatment. Would I take gold myself if I had rheumatoid arthritis? My answer would be yes, and I would feel that if I took it early in the first few months of the disease I would have a good chance of making a recovery, with one or more relapses possibly later on, but with eventual recovery.

Young physicians could use this drug if they were careful, but they certainly should have a frank talk with the patient and with his family and explain to them that gold is a dangerous agent and may occasionally cause severe reactions even under the most favorable conditions. I do not see any reason why a young doctor under such circumstances should not use the drug.

DR HENRY B RICHARDSON Dr Cecil, how sick would a person have to be before you would want to risk the gold treatment? Whenever the diagnosis is made, or would you be guided by the symptoms?

DR CECIL I had a letter from Dr Forestier about a year ago in which he seemed quite impatient with the tendency of American

physicians to use gold only on late cases in which everything else had failed. He did not think that was fair to the remedy. He claimed that gold should be used *early* in the disease before permanent damage has been done to the bone and cartilage. This reasoning seemed to be fair enough. The earlier you use gold, the better.

DR EPHRAIM SHORR A number of years ago the prevailing ideas with respect to foci of infection were that if the focus was definite and could be removed early in the disease the beneficial effects were much more striking but that with time the influence of the removal diminished greatly. I bring up this point to ask whether that is your opinion and consequently whether the tendency to under-emphasize infection today is not to some extent dangerous and unfair to the patient?

DR CECIL I think a patient with rheumatoid arthritis should have any obvious focus of infection removed. If the tonsils are badly diseased, if the sinuses are giving trouble, or if the teeth show some definite abscesses, these infected areas should be taken care of. There was a time when every rheumatoid had his tonsils and teeth removed, almost as a routine. As a result he often parted with innocent tonsils and many perfectly sound teeth which he might just as well have kept. Even when obvious foci of infection are discovered, I would not expect their removal to have any permanent influence on the course of the arthritis. However, my own feeling is that there is such a thing as "focal infection" arthritis as distinguished from the rheumatoid type. I remember a doctor who used to come to my office who had a chronic prostatitis and several swollen painful joints. Whenever his prostate was massaged, he would suffer a prompt exacerbation of swelling in his joints. He did not have what I would call rheumatoid arthritis, but he had rather a peculiar hot, inflamed type of joint which would come and go and which never progressed into a typical rheumatoid picture.

DR SHORR I wonder also whether inspection of the tonsils is sufficient. I recall tonsils that were removed and cultured by Dr Stansby, which grossly looked entirely normal, yet not infrequently there would be collections of pus with almost pure cultures of streptococcus. Do you think that the risk attending tonsillectomy in a patient who is quite ill with arthritis is so great that it outweighs the possible beneficial effects?

DR CECIL About 1 or 2 per cent of the patients in our series have had exacerbation

value Iron does not control their anemia as would be expected because of the fact that their anemia is not as a rule due to iron deficiency. The value of the removal of tonsils and teeth as foci of infection is open to serious doubt. Patients seem to be no better off after these procedures have been carried out. Vaccines have also made out a bad case for themselves. They seem to be no better than water given under similar circumstances.

The use of gold salts came in for some attention. Weekly intramuscular or intravenous doses of 10 to 100 mg in courses of 1 to 15 Gm have been reported to bring about remissions, more frequent, more complete,

and more protracted than occur without this treatment. Dr Cecil believes that gold salts have solid merit. The frequency of dangerous reactions was stressed. A more skeptical view of their value was taken by other students of arthritis at this conference. The question was raised whether the use of gold salts, which had its origin in a double error—namely, in the notion that rheumatoid arthritis is a form of tuberculosis and that gold is of value in tuberculosis—may not represent merely another temporary episode in the history of the long list of therapeutic promises for rheumatoid arthritis which have failed to materialize.

TREATMENT OF WAR BURNS

At the Royal Society of Medicine, Surgeon Rear Admiral Wakeley opened a discussion on the treatment of war burns, as reported in a London letter to the *J.A.M.A.* At the outbreak of war it was thought that the treatment would be simple, and the use of tannic acid was regarded as completely satisfactory. But this proved far from true in the navy, where many casualties from burns occurred.

War burns differed from those of civilian life in that they might not be treated for many hours or even days. On a warship only first-aid treatment could be given in the majority of cases. Most of the burns involved the face and hands and were due to gun flash, bomb flash, incendiary bombs, or gasoline. First-aid treatment consisted in morphine, warmth, and fluid to counteract shock. If this was marked, plasma transfusion was given. Secondary shock occurred some hours after the burn and accounted for 80 per cent of the deaths.

The most important factor in it was the loss of plasma from the burned surface. The blood might be so concentrated that the hemoglobin rose to 140 per cent. The best treatment was to replace the plasma protein. Given intravenously, plasma raised the osmotic pressure sufficient to restore the normal distribution of fluid between the vascular and interstitial components. Whole blood transfusion and intravenous physiologic solution of sodium chloride or sterile water were contraindicated. The amount of plasma necessary must be estimated by frequent blood examinations.

Wakeley agreed with Aldrich that acute toxemia from burns was due to streptococcal infection. It did not appear for several days and

could be prevented by primary cleansing before coagulation. It was not nearly so common as in the last great war, for which no doubt coagulation was responsible.

For extensive burns with toxemia, saline baths had proved valuable. In first- or second-degree burns, sepsis could be prevented if coagulation treatment was given at once and adequate cleansing and coagulation followed on arrival at a hospital.

With regard to local treatment, he favored gentian violet jelly with merthiolate (1:5,000), which could be applied to the burned areas without any cleansing. The application should be liberal, for it was painless and even soothing. It would seal off the burned area and form a crust which remained until arrival at a hospital. Local treatment should not be given in the presence of shock. Tannic acid should not be used on the hands and face.

In the hospital the treatment of shock was instituted, and plasma banks and dried plasma were playing an important part. Oxygen administration was helpful. After shock had been treated the patient was taken to a warm room and anesthetized with gas and oxygen.

The burned area was thoroughly cleansed with saline solution, dried with an electric hair dryer and two applications of an aqueous solution of triple dye (2 per cent gentian violet, 1 per cent brilliant green, and 0.1 per cent acriflavine) sprayed on the surface. This produced a thin, supple, adherent tan, which loosened about the eighth day and gradually fell off, leaving a healed area. If the burn was extensive and of third degree, the area should be excised and skin grafted.

HOPE IT WAS A SOFT HAT

Mike had just been operated on and was placed in a ward between two other boys from the Emerald Isle. After he had come out of the ether and was still sort of woozy, the Irishman on one side yelled over to the third one saying, "Pat, how was your operation?" Pat replied, "Sure, they forgot to remove the sponge from me and they had to reoperate and take out the

sponge. And how is yours, Jim?" To which Jim replied, "They forgot the scissors in me. They had to reoperate and take out the scissors."

About that time Mike's doctor stuck his head in the door and hollered, "Anybody see my hat?" and Mike fainted.

—Davis Nursing Survey

familiar with it or not. It dates back to Forestier's visit to the United States in the early thirties. He lectured on gold therapy in various clinics of this country, and all who were interested in arthritis undertook to treat some patients with gold. Nearly every one of us ran into trouble. I encountered an exfoliative dermatitis with the third case I treated, and others had similar experiences. We became frightened and abandoned the use of gold entirely. However, favorable reports on gold therapy kept coming out in French and English journals. Finally, some of these English physicians—arthrologists, if you want to call them that, or rheumatologists—working in the arthritis clinics in England came over here and took us to task, and the *Lancet* had an editorial in which American medicine was chided for not making use of such a valuable agent. About three years ago after being thus chastised by our English friends, some of us here in America turned to gold therapy again and we are now giving it a really fair test. We are beginning to see that there is something in what the French and English have claimed for it.

DR TRAVELL. Dr Cecil, isn't it true that when gold was first introduced the doses that we used were much larger and the incidence of toxic effects much greater?

DR CECIL. Yes, most of the severe reactions and fatalities have been in patients who were receiving 200 mg doses and total doses of 2 or 3 Gm.

DR TRAVELL. We are perhaps over-emphasizing the dangers of this substance when it is used conservatively.

DR CECIL. The trouble is that there is a very small margin between the toxic and the therapeutic dose. In fact, some think the patient gets the most striking benefit when he shows some toxic effect such as a skin rash, a sore mouth, or something of that sort. That has been my experience. Others do not want to admit this. A colleague of mine recently remarked that in five years we would probably have gold salts that could be taken freely without any danger at all. Do you not think that is likely, Dr DuBois?

DR EUGENE F. DuBois. I think there will always be danger.

DR RICHARDSON. Are the toxic effects in proportion to the dose?

DR CECIL. They are, except in about 10 per cent of the patients who are quite sensitive. These may have toxic manifestations even after the first, second, or third small dose.

DR C. H. WHEELER. We had a patient in

the hospital, Dr Cecil, who developed a severe exfoliative dermatitis from the gold but who experienced so much relief from the arthritis that he would willingly spend several weeks in the hospital with dermatitis again, if it were necessary, in order to secure such benefit.

DR GOLD. From the thirty odd therapeutic measures we end up with about three—arspin, iron, and gold.

DR CECIL. That is about right.

DR GOLD. What happened to arsenic and strychnine?

DR CECIL. I think they were remedies that were used at one time for almost everything.

DR PAUL REZNIKOFF. Do you think iron is effective in arthritis?

DR GOLD. Do you want to take out iron also?

DR CECIL. I think Dr Reznikoff is making a good point. It is extremely difficult to build up the blood with iron when the arthritis patient has a really severe anemia. Some will respond, but if the count drops to as low as 3,500,000 erythrocytes there is usually difficulty.

DR REZNIKOFF. Even if they have mild anemia, I question whether iron is effective because there is no iron deficiency.

DR GOLD. We may now summarize briefly the chief points that emerge from the discussion. The treatment of rheumatoid arthritis has been considered. This disease is distinguished from other rheumatic states by the following specific pathologic changes, swelling and pain of several joints, the fusiform finger, and increased sedimentation time of the red blood cells. Its course is chronic, it shows frequent and protracted remissions and is rarely completely cured. Its cause is unknown, but it is still regarded as a form of chronic infection. The mild forms may be managed as ambulant patients, the acute and severe forms require the hospital, and the advanced cripple needs sanatorial care.

Only a few of the numerous agents and methods of treatment were considered. Physical and mental rest, a well-balanced diet, and abundant vitamins are important in order to secure the best results. The application of heat in various forms is helpful. Physical therapy, fever therapy and blood transfusions, corrective exercises, and various orthopedic procedures play a useful part in appropriate cases.

Acetylsalicylic acid appears to be the favorite for the control of the pain. Iodides, arsenic, and strychnine are of questionable

to be supported by tax monies. Before they make any such decision they will wish to learn the facts from the experience of other people and governments whose schemes with the same basic idea have been put into effect for groups limited by earning capacity, and in these instances for a part but not for all of the medical services which are thought of here as logically to be included within a system of socialized medicine.

Sickness Insurance and "Health Insurance"

It is under sickness insurance schemes that some other nations have put into effect for some of the people medical services limited in one way or other—the members of the insured group paying some part of the cost.

These systems are commonly referred to in this country as "health insurance," and in fact this term has been used since about 1911 in England to describe what is neither insurance nor a health service. The cost of so-called "health insurance" is met only in part by the people "insured." The taxpayer who is not eligible for benefits and the employer who receives no service are both required to contribute to the cost of maintenance of medical and other services applicable to but a fraction of the population. This is not insurance but state and contributory philanthropy. While treatment of sickness at home and office by the physician supported by the sickness insurance system may result in the restoration of the patient to health, health services as we think of them in this country, prevention of disease and supervision of personal and collective health, do not enter these misnamed "health insurance" schemes at all. Sickness insurance as it is practiced in several compulsory government schemes in Europe cannot be honestly described under the term of "health insurance." Health is not insurable on any financial, social, or medical basis, although services intended to secure a better measure of health can be prepaid by contributory schemes as can services for sickness. As a matter of fact, no sickness insurance schemes here or abroad include personal health services, that is the private practice of preventive medicine, within their benefits. Keeping in mind that the principle of insurance, whether on a voluntary or compulsory basis, whether operated under government or private nonprofit or commercial auspices, can be applied to meet the cost of medical care for disease or injury, it must be understood that there is no way in which the insurance

principle can be applied either to guarantee health or to meet the cost of services intended to keep well people well. Not all types of physician's services meet the limitation of an insurable hazard, "that the happening of the event must not be subject to the control of the insured individual."

"Health insurance" is a misnomer, as a slogan it is deceptive. The use of this term leads to muddled thinking and, if applied to the realities of individual or community life, can only develop a sense of frustration and disappointment in those to whom it is offered as a way of making medical care available for all corners. Health can no more be insured as an insurable risk than education, character, or morals.

Public Health Services

Local and national governments in the nations of western civilization have been so convinced for about a hundred years of the necessity of health protection by the exercise of the police power of the state for public benefit that there is, nowadays, no uncertainty as to the proper functions, methods, costs, and results of public health services.

The application of the sciences of preventive medicine by government for social ends constitutes what is correctly defined as public health work. This is to be clearly distinguished from the private practice of preventive medicine and from the art and science of so-called curative medicine—that kind of medical care which depends upon the individual application of diagnosis and treatment for humane and competent care of the sick patient by the physician of his choice.

Public health work is supported by the taxpayers as they support public services for fire protection, law enforcement, parks, highways, schools, and courts of law.

Organized Care of the Sick

Care of the sick in hospitals and kindred institutions and, to an increasing degree, through medical and nursing care in the home is supported by the taxpayers with the co-operation of agencies maintained in whole or in part by voluntary contributions. This is what is meant by organized care of the sick.

Socialized medicine as we have defined it is not primarily of interest to the indigent, the very poor, or the wage earner of small means for whom any illness that cuts off his income for a week or so makes him dependent—at least in regard to the cost of his medical care. These indigent and medically indigent frac-

THE QUESTION OF SOCIALIZED MEDICINE

HAVEN EMERSON, M D , New York City

WHETHER or not we shall have socialized medicine will be decided by what we include under the term and upon the practicability of achieving what people hope for from such uses of medical resources without unreasonable cost

State Medicine

We have had state medicine in gradually increasing scope, usefulness, and cost since the very origin of our nation, for among the first activities of our federal government in 1789 was the provision of medical care for merchant seamen at various ports. Out of this marine hospital service operated under the Treasury Department has grown the United States Public Health Service—only recently transferred to the jurisdiction of the Federal Security Agency. Not only does the federal government conduct comprehensive activities for the prevention of disease and protection of the people's health by its control over interstate and foreign commerce but it operates many hospitals and similar institutions for veterans and certain classes of federal employees, including those of the Army and the Navy.

Each state and many a city and county government operates institutions and agencies for care of certain large groups of patients with mental, tuberculous, and other communicable diseases, special institutions for the sick among criminal and dependent persons, and the whole range of general and special hospitals, dispensaries, and home services with which we are so familiar under the departments of hospitals, health, and welfare of our cities.

All these activities of government have been accepted as desirable, necessary, and practicable. Furthermore, they have probably been less costly and of more benefit socially than if the services rendered had been conducted under other auspices.

There is no controversy of opinion or uncertainty in the public mind as to the continuance of these public services for care of the sick, except as to details of quantity and quality of such care to be provided at the taxpayer's expense.

Socialized Medicine

What is the difference, then, between state medicine as we have long experienced it and the content of socialized medicine as popularly understood? By socialization of medicine I take it that most people mean the conduct of all services of physicians and the associated professions and vocations, whether in institutions or by direct personal relation between individual doctor and patient, through a system of salaried employees of the state. Or they mean that such services are to be provided by some agency created or permitted by the state according to the need of each member of the population, whether for promotion of health, protection against disease, or for diagnosis and treatment of the sick. It is expected that these facilities would be available regardless of the ability of any individual in the community to pay any part or all of their cost at the time he receives them or later.

Nothing remotely resembling such a complete undertaking by government or by voluntary agencies under official auspices has been put into effect anywhere in the world, although it had been approached in some respects in Denmark after a variety of experiments over a period of one hundred years. In the Russia of today, socialized medicine in our chosen sense of the term, while adopted in theory, does not, in fact, function practically. There are areas such as those of the impoverished Highlands and Islands of Scotland where only public medicine in its entirety will work. A few such areas may also be found in North America. It may well be that some political unit, state, city, or county in the United States will be authorized by its voters to embark on such a project. We can only speculate as to the costs and results, since we have no basis for estimating the demands that would be made upon the professional personnel or the extent to which the people of the community would be satisfied with the medical care they received, or with its expense.

There is certainly nothing in our form of government to hinder the voters from demanding and authorizing all the functions of a comprehensive system of socialized medicine.

the facilities of the appropriate medical or surgical specialty for every patient who presents symptoms of disease. The competent physician is expected to avoid unnecessary examinations, operations, or other treatments, which, though conceivably applicable, may not be either necessary or desirable for the patient under consideration. Under sickness insurance schemes, and one may expect also under any system of socialized medicine, there will be no way by which the physician can be compelled, or the patient can be persuaded, to forego the use, whether necessary or not, of any procedure, however costly, which the patient may request. As the physician and the patient are both relieved of any restraint upon the score of direct personal expense of diagnostic or treatment facility, it is to be expected that the cost of medical care will increase considerably under any system of socialized medicine. There is no valid evidence or assumption that the cost will remain at the present level or fall.

Is There a Solution?

How are we to go forward to settle disputed points, form sound opinions, and make decisions that will satisfy hopes and doubters?

We can perhaps get our answers piecemeal. We can undertake—either for some general but not inclusive type of medical service, or for some significant fraction of a population, or for a limited political unit—the creation of a service in which the people as a whole constitute the employer and the appropriate professional personnel—physicians, dentists, nurses, bacteriologists, pharmacists, and medical institutions—are the employees under conditions satisfactory to both parties and publicly recognized as fair and just.

The quality of medical care, upon which the success or failure of any individual physician, or employed group of them, will always depend will be determined by the professional qualities of those whom the social unit, community or people, employ. It is not conceivable that, while our constitution and form of government endure, physicians or others can be compelled to accept public service against their preference. There is no quicker way to denigrate a body of professional practitioners than to deny them the right of self-determination of employment. An even superficial acquaintance with the prewar scene in central Europe will convince the shrewdest skeptic that medical services are particularly sensitive to conditions created under compulsory sickness insurance schemes.

There should be no serious difficulty in voluntary recruiting of licensed practitioners of the necessary professions to serve a community that wishes to replace private initiative in medical care by a system of socialized medicine.

The methods of evaluating the results of such a form of medical service are available and can be relied upon for the cruder manifestations of ill health. Since the payments would all be from tax money, exact accountability should be easy to attain.

The overhead expenses should be calculable with some exactness.

Alternatives to Sickness Insurance or to Socialized Medicine

Time and experience in a number of such enterprises should go far to determine whether the people of the United States want more of them or will turn to the development of higher proficiency by the methods of medical care now in more common use. In the meantime would it not be well to put our minds upon alternative methods, equally consistent with our form of social or governmental order and perhaps more suited to the traditions and peculiar genius of our people and the professions? I refer to three American contributions to the application of and payment for medical care. First in time of development is the voluntary organization of groups of physicians whose collective skills provide for a quality of care impossible for any one physician, however erudite and experienced, to offer. This is essentially the method of the general and special hospital with its medical board and staff. Second in development, but by far the most rapidly growing and financially interesting of the devices of patients and doctors to affect the cost and manner of paying for care in sickness, is the prepayment plan for hospital care. This is sound insurance and a method capable of wide application into other fields of medical care such as visiting nursing or service of physicians. The chief hazards that such prepayment plans for meeting the hospital costs for illness face are the selfishness of patients, individuals who abuse their privileges, and the complacency of physicians who recommend patients for hospital care needlessly. These common expressions of weakness or dishonesty in human character can only, to a limited degree and at considerable added cost, be offset by precautions intended to frustrate such insured persons as seem determined to get their money back or its equivalent in terms of service.

tions of the population will in any event be cared for at public expense when sick. The poor and the temporarily medically indigent crave escape from humiliating intrusion upon their privacy by the "means" test. They favor socialized medicine not because it gives them better medical care but as a means of escape from the questioning of the social worker, the inspector, the investigator. The well to do, the rich, will always be able to command the services of physicians and medical institutions by paying for what they want or need, regardless of, or in addition to, any sums they may be required to contribute in the form of taxes or insurance to support socialized medicine.

Those concerned with increased amount, improved quality, and decreased cost of medical care which they hope to obtain through socialized medicine will be found among self-supporting persons or families with incomes of \$1,200 a year or over, who believe that by some method of pooling their resources they will attain three objectives—that is, more, better, and less costly medical care. This is an admirable goal to hope and plan for. Certainly, if this can be reached by any proper use of social resources and the authority or consent of government, federal, state, or local, the professions directly concerned with providing care for the sick will be found encouraging and supporting the project.

To the question—"will socialized medicine provide an increased amount of the kind of medical care which the people believe they need?"—one can safely answer, "yes!"

Wherever the barrier of an immediate or cash expense is removed, patients will call upon physicians and medical institutions more frequently, and the occurrence of illness justifying medical attention will appear to double or treble in amount and duration. The amount of illness will not alter, but resort of people to free medical service will be much more frequent. There is no evidence that the people thus more abundantly served are better cared for or have better health.

To the question—"will socialized medicine improve the quality of medical care?"—the answer must remain uncertain until we have a fair and safe yardstick to apply to medical care by which we can test change of quality and until, somewhere, an inclusive service under the principles of socialized medicine is actually put into operation. From experience in some European nations with sickness insurance schemes that most nearly correspond to the principles of socialized medicine we

have learned that the quality of care, as well as the amount available to the lowest insured groups, is generally improved, while the general level of medical attention to the sick by the physician in his office or at the patient's home falls decidedly below the level of what the average self-supporting family obtained from their private physician formerly. However, this failure to improve quality under insurance schemes may, in those countries of Europe where they have been best developed, be due in large part to the fact that the insured clientele receives no specialist or hospital services, both of which would certainly have to be included in any scheme of socialized medicine acceptable in the United States. Improved quality of medical care, under whatever plan of payment or employment of physicians and assistant professions, will always depend upon rising standards of medical education, increased opportunities for postgraduate training and re-education, and such freedom from economic limitations as will encourage the physician to develop initiative and to test new methods of diagnosis and treatment. None of the sickness insurance schemes so far developed have created such conditions of professional employment as contribute directly to a better quality of medical care. It is fair to say that advances in medical care since 1883 in Germany and since 1911 in England, and for similar periods in other countries with sickness insurance services, have not come from physicians engaged in serving the insured fraction of the respective populations.

As to the cost, the amount, and the quality of services expected by members of a comprehensive system of socialized medicine, we can be reasonably sure that it would be far above the cost of the care now provided. There are few individuals who can afford to avail themselves of all the resources that the medical sciences have put at the service of the physician to apply for early, prompt, accurate, and thorough diagnosis, and for the most appropriate and successful treatment of sickness. There is certainly no government that could now finance the cost of medical care at such a level. Even the more generously financed of the voluntary sickness insurance schemes, those which call for a contribution of not less than \$3.00 a month from each beneficiary, cannot supply the amount of medical attention that people think they need and of a quality acceptable to the medical profession in this country.

Fortunately, it is not necessary to use all

(S-1620) should be allowed to become a law as a means of facilitating the establishment by federal subsidies to states of a scheme of socialized medicine within such states as may elect to try out such a plan

Federal subsidies for general medical care as proposed under the half-dozen categories of the Wagner Bill of 1939 (S-1620) are of quite a different order of magnitude and purpose from those, limited in objective and in the amount of money proposed, for hospital construction in backward and impoverished states as expressed in the Wagner Bill, Senate Introductory 1842, of the 1940 session of Congress

Recommendation

Instead of any compulsory system of socialized medicine, I advise the development of group medicine as carried on by organized hospital and clinic staffs under voluntary aus-

pices, extension of voluntary prepayment plans for hospital and other forms of medical care, voluntary sickness insurance schemes, and encouragement under state laws of voluntary cash indemnity insurance plans to meet the cost of medical care of the individual in sickness and for health protection

With these methods to bring about better medical care and provide thrifty methods to meet its cost, we have a right to expect that public health services will be adequately supported by government. Government alone can operate the necessary public health facilities. Supplementary to these, close cooperation and interdependence of the private practitioner of medicine with the local and state department of health will be so extended that the private practice of preventive medicine will be as thoroughly recognized as are the curative services of physicians to the families of the nation today

RETURN OF BREAD CAST ON THE WATERS

"In this hazardous period of social, economic, and political instability, which is threatening the accepted foundations of life including the time-honored principles of medical practice, it is well for us to continue voluntary care of the poor," says an editorial published in the *Journal of the Oklahoma State Medical Association*. This can be accomplished either through individual or organized effort. Accumulated experience indicates that individual care is not wholly without material reward.

"Dr Daniel Drake, one of the great in the history of medicine, once said to Dr Lunsford P. Randall, of Louisville, Kentucky 'I have never seen a great and permanent practice, the foundations of which were not laid in the hearts of the poor. Therefore cultivate the poor. If you need another, though sordid reason, the poor of today are the rich of tomorrow in this country. The poor will be the most grateful of all your patients. Lend a willing ear to all their calls.'

"In Abraham Flexner's autobiography, *I Remember* there is a statement suggesting that Dr Randall may have passed this advice on to his illustrious sons. Dr Flexner says that when he was a boy one of them treated him for a severe and obscure illness and that 'his remuneration was a weekly loaf of mother's bread, which I regularly used to carry to his home.'

"Early in his career Benjamin Rush said the poor were his best patients because 'God is their paymaster.' At the age of 68, on his deathbed, he said to his son 'Be indulgent to the poor.' Though a century has passed, we find the follow-

ing in the *Life of Chevalier Jackson*. Dr W. W. Keen is quoted as having said, 'Chevalier Jackson's skill was acquired by a lifetime of work with the poor.' No man could wish for a greater reward than Dr Jackson's skill and the realization of what it has meant to humanity.

"Returning to the sordid side, it may be pointed out that in the eighteenth century Fothergill, whose annual income was \$125,000, said 'I climbed into the pockets of the rich over the backs of the poor.'

"The author recalls that one of his professors, a brilliant teacher and busy practitioner, attributed his high professional rating among the well to do on Fourth Street to the influence of his washerwomen and nursemaid patients in poverty row on the water front.

"In his remarkable work on surgery, Henry of Moudeville made the following statement: 'If you have operated conscientiously on the rich for a proper fee, and on the poor for charity, you need not play the monk, nor make pilgrimages for your soul.'

"Let us pray for the preservation of personal freedom in the choice of a physician. It is this that keeps every good doctor's door open to the poor. The doctor needs the chastening influence of their presence, and they need the sense of security and independence which a free choice helps to preserve. In time of trouble there is something intensely vital about this intimate relationship. No doubt this is due to the fact that the true physician is genuinely interested in his patient and does what he can to mend broken bodies without regard to religious faith, moral, social, or financial position."

Nature is the great collaborator. As Ambrose Paré used to say "I treated him and God healed him"—*Ill Med J*

Five doctors signed the Declaration of Independence. Can one physician in ten thousand name them?

rendered. The whole system of hospital prepayment plans depends upon pooling the small resources of the many, so that the few (10 per cent) who need hospital care can have it in adequate amount and without unbearable individual costs. If any considerable number of members of such a plan demand hospital care that is superfluous, the rates for all the other members will have to be raised or the benefits be reduced.

The third device to make the costs of sickness less unbearable is that of voluntary cash indemnity insurance, by which persons may buy as much insurance as they wish (as in the case of life insurance), the payments to be made to the insured on proof of illness. The insured may use his payments as he wishes to purchase medical care of his own choice, or he may use the money to meet his living costs while sick. Such systems, permitted under good state insurance laws, are sound in financial and actuarial principles and serve to facilitate habits of thrift.

It is my personal opinion that for the United States, at its present level of social and governmental development, any system of socialized medicine as above defined, on a national scale or compulsory for any economic group of our population, would result in a marked arrest of medical progress, a deterioration of the quality of service rendered, and a great increase in the cost of medical care without equivalent return in effective quality or quantity.

Further, I believe that while experimentation with such a system on a state-wide basis would face less serious hazards of poor performance and exaggeration of costs than would a national application, nevertheless the disadvantages, moral and social, of compulsion by government in this field of human relations would outweigh any problematic advantages which may be claimed for it. As an example of all that is undesirable, costly, and profitless in a proposal of socialized medicine for a given state, let me cite the so-called Goldstein Bill, introduced in the New York State Legislature of 1939 and listed under the 1940 proposals as Assembly Introductory Number 469. In this bill we have, in all its simplicity and complexity, precisely what the promoters of socialized medicine believe desirable and practicable. Let me quote the following significant paragraphs from the bill.

"General objectives and powers and duties of the department. (1) It shall be the objective and ultimate goal of the department to

improve and maintain the health of the people of the state and to render free of charge, under rules and regulations to be prescribed by the department, all medical, surgical, dental, nursing care and treatment, and all other services and facilities known to science and designed or adapted for use in all cases of sickness, accidents, and childbirth, to and for residents of the state, including free transportation to and from hospitals, maintenance in hospitals, the furnishing and supplying with out cost of medicines, drugs, and all medical, surgical, dental, and pharmaceutical supplies and appliances required or deemed advantageous for the care, treatment, recovery and rehabilitation of a sick or injured person.

"The department shall have and exercise exclusive charge and control over all of the public hospitals of the state and of the staffs, officers, and employees thereof and shall have and exercise complete supervisory powers over all private hospitals and the staffs, officers, and employees thereof."

I doubt if reasonable men and women with their own and their neighbors' medical interests at heart will accept or, if it were passed, could live content and well served under any such law and its application to all people and all their medical needs, and to all the members and institutions of the medical and associated professions in New York or any other state in the United States.

Whether without compulsion and without a unit of population at least as comprehensive and stable as those of some of our larger states a plan of socialized medicine could be made effective I do not know, but I suspect that it could not.

If such a plan is not to be recommended on a compulsory basis, it might be tried as a voluntary scheme for those who wish to engage in it under suitable insurance supervision within the limits of the state or smaller political unit such as a large city or group of counties. I do not recommend such an experiment to any state or community, but I believe it should be allowed by permissive legislation if a sufficient body of voters and legislators can be found to support it and if the general tax-paying public of the nation can be protected against financial exploitation when the members of the plan of socialized medicine find they cannot meet the costs from their own tax resources, which will quite surely prove to be the case.

I believe that no federal legislation such as the Wagner Bill of the last session of Congress

Annual Reports

1940-1941

Report of the President

To the House of Delegates, Gentlemen

As my term of office comes to a close, I am led to consider how burdensome the duties of the presidency might be were there a less efficient state organization. Thanks to the proper functioning of the administrative and advisory groups within our State Society, my task has been rendered easy and altogether pleasant.

The council, the several committees, the general manager, executive officer, counsel, the director of publicity, and office personnel—all have given a splendid demonstration of loyal, willing service. I am grateful for the high privilege of being associated with them in the promotion of common interests.

The tragic march of events across the seas has shattered our people's dream of a country at peace with the world, and has made necessary the adoption of a program for adequate national defense. Perhaps among no other group is the impact of the present crisis felt more strongly than among the members of the medical profession. In the selection and maintenance of a vigorous and healthy armed force their aid is of paramount importance, to a civilian population, subject to the added emotional and physical ills of a wartime economy, they must be prepared to minister.

In furtherance of a program of aid in the present emergency, the members of our Military Preparedness Committee and those of the Public Health and Education Committee have given unselfishly of their time and effort. The Military Preparedness Committee, with the help of chairmen in every county society, has furnished the draft and advisory boards under the Selective Service Act with a roster of physicians available for the examination of draftees. It has also drawn up plans looking to the proper medical care and treatment of the civilian population in the event of war, informing itself as to the adequacy of staffs and equipment in every hospital in the state.

The Public Health and Education Committee, acting with the State Department of Health, has arranged a program of postgraduate courses for the physicians in the different sections of the state, who wish to be kept informed on the new methods used in the care and treatment of victims of war. The work of these committees, in the nature of things, has a particular value, and too much credit cannot be given to their members for a task well done.

Also, it is fitting to note the splendid cooperation accorded these committees by the Committee on Publication and the Committee on Publicity which have given public and profession

alike much timely information relative to preparedness activities.

The Public Relations and Economics Committee with its subcommittees on Public Welfare and on Medical Indemnity Insurance and the Workmen's Compensation Committee merit commendation for the zeal with which they have applied themselves to the study of some difficult problems.

There is little to report in the matter of medical expense indemnity insurance. This plan, as approved by the State Society after much study, represents a laudable attempt upon the part of organized medicine to aid in the solution of a vexing welfare problem. Should it be adopted widely, the plan undoubtedly would bring needed relief in the form of adequate medical care to those of our wage-earning population in the moderate income brackets. But the idea is new and the public is reluctant to buy this form of insurance at the present time. There is ground for hope that the plan, if given a fair trial over a space of a few years, will meet with a more favorable response.

However, this hesitancy upon the part of the public to subscribe to the medical profession's voluntary health insurance plan carries with it a feeling of reassurance in the presence of the ever-menacing specter of socialized medicine and compulsory insurance legislation. It is not conceivable that the thinking public would reject a voluntary insurance plan in favor of one of a compulsory nature in which the physician-patient relationship is bound to be impaired.

While measures for national defense have overshadowed, in recent months, easy agitation for federal or state legislation in regard to socialized medicine or compulsory health insurance, we must remain ever watchful if we wish to maintain our present tried and truly progressive system of caring for the health of our people. This threat to the integrity of the profession can best be resisted by physicians themselves continuing to win and retain the confidence of the public. Such confidence will be established, in the measure that each of us succeeds in holding to the strict ethical standards set by the medical profession. We have dedicated our lives to the maintenance of a noble ideal of unselfish service. Today that ideal is being challenged from without by those of little understanding. Shall we, too, challenge that ideal by our indifference to the value of the sterling principles handed down as a precious heritage by those who have gone before us?

JAMES M. FLYNN, M.D., President

April 1, 1941]

REPORT OF THE SECRETARY

707

Coordination of Activities The Council and its committees have continued to function smoothly, wisely, and without overlapping of effort. In a number of instances it has been found worthwhile for two committees, the Public Health and Education Committee and the Public Relations and Economics Committee, to consider, together, subjects of import to both. Thus, different angles of approach have been utilized. Particularly has this method been valuable where conferences were held with representatives of other organizations or government departments. Industrial health, the school health program, laboratory medicine, and other matters have been thus discussed.

Five subcommittees, on School Health Program, Maternal Welfare, Medical Expense Insurance, 4-H Clubs, and Medical Relief, also have been hard at work in their special fields as shown in the Council Report. They have proved very helpful to their parent Council Committees.

The Committees on Legislation, Constitution and Bylaws, Malpractice Defense and Insurance, Scientific Program, Scientific Exhibits, Arrangements for Annual Meeting (these last three constituting the "Scientific Assembly" Committee of which the general manager is chairman) have carried on and are carrying on in the regular way. The Advisory Committee on Ophthalmological Problems has been called into action once during the year (see Council Report). The Special Committee of the Society on Prize Essays (Dr. Chas. Gordon Heyd, chairman, Dr. Conrad Berens, and Dr. John E. Scarfi, all of New York) has reviewed five essays and will make its report in person at your meeting on April 29, 1941.

The new Committee on Medical Preparedness went into action immediately after its appointment on June 14, 1940. It has done yeoman work ever since. The headquarters office has given of its best from all hands to help in this emergency work—and has been glad, without reservation, to do its bit. There was first the State Society Questionnaire, then the job of meeting the request from the Governor for nominations for medical examiners for Local Draft and Medical Advisory Boards in the state to be set up under the Selective Service Act when and if passed, these nominations to go through the State Adjutant General's office in Albany and its echelon office in New York City. Both these tasks were undertaken and the office

force has been busy—very busy—with them, both before and since passage of the Selective Service Act. The peak of the load on the office was passed in January last but there is evidently a steady job here that will continue to need not only the attention of the Medical Preparedness Committee but also execution of its behests. Evidently, much remains to be done to help the County Society Committees on Medical Preparedness in their classification of the physicians in their realms as to assignment to civilian practice and as to availability for military medical service now and in case of actual war.

There are two departmental activities of the Society that deserve special mention and special commendation. The one is the work of the Bureau of Workmen's Compensation and the other, the work of the Bureau of Public Relations.

The Workmen's Compensation Bureau, under the industrious management of its director, Dr. Kaliski, has continued to work busily for the interests of physicians under the Workmen's Compensation Law. Your secretary is at all times in close contact with this work in the headquarters office. It can best be described as a source of real security for the physicians of the state qualified for compensation work.

The Bureau of Public Relations, also in the headquarters office, under the expert guidance of its director, Mr. Dwight Anderson, has not only continued to effect medical publicity through the usual channels but has been able to get under way arrangements for a series of radio programs. Thus, use of all outlets for contact with the public will be accomplished.

Your general manager in his contacts and work with the committees and the bureaus wishes to record his sense of privilege and pleasure in serving with them and helping to the best of his ability the coordination of effort. He wishes especially to express his deep personal gratification over the chance to aid in medical preparedness as a significant part of this country's present need to defend itself for all time and in all ways.

In closing this report, I wish to take this occasion to extend my sincere thanks to the general staff under the able supervision of Miss Dougherty. Their work has been loyal, devoted, and unflinching.

Respectfully submitted,
PETER IRVING, M D, Secretary

March 3, 1941

Report of the Council

To the House of Delegates, Gentlemen

Your Council has the honor to report on its executive and administrative management of the affairs of the Society during the period following your last meeting on May 6-7, 1940. The various matters before it are here presented in twelve successive parts.

PART I

Postgraduate Education
The keynote of performance of the education duties has been the expansion in amount and kind of postgraduate teaching open to members.

of the Society. Following the untimely death on April 12, 1940, of the former Chairman of the Committee on Public Health and Education, Dr. Thomas P. Farmer, the personnel of the Committee was realigned, as follows:

Oliver W. H. Mitchell, M D, Chairman
George Baehr, M D
Charles Dayton Post, M D
Syracuse
New York
Syracuse

The Council approved the following report which summarizes the work of the year in or-

Report of the Secretary

To the House of Delegates, Gentlemen

Another unusual administrative year has passed since your last meeting on May 6 and 7, 1940. The regular work of the headquarters office has gone steadily forward but with certain newer methods needed and developed. The co-ordination of the activities of the Society has called for a faster pace with the addition of new functions for the Council, its Committees, and the Management.

Membership Elected in 1940 were 1,045 new members, 246 were reinstated. The net increase as shown in the second table below was 624.

Membership—December 31, 1939	16,785	
New Members—1940	1,045	
Reinstated Members—1940	246	18,076
Deaths	199	
Resignations	105	304
		17,772
Dropped for nonpayment of dues—December 31, 1940		363
Total Membership, December 31, 1940		17,409

Honor counties (none of whose members failed of their dues in 1940) include Cattaraugus, Chenango, Columbia, Essex, Fulton, Genesee, Livingston, Madison, Orange, Putnam, Schuyler, Seneca, Sullivan, Tompkins, Washington, Wayne, Wyoming, and Yates.

Comparative totals in the period of continued rapid increase that began in 1935 follow:

1935	14,064
1936	14,662
1937	15,529
1938	16,177
1939	16,785
1940	17,409

New York Office The move to 292 Madison Avenue has proved most satisfactory and the expectations expressed for improvement in working conditions have been fully realized. The mid-town location makes for greater convenience of members and officials coming from outside the city. The bringing together on one floor of the different departments saves time for all concerned in office routines, and this has been reflected in the ability of the clerical force to take on the expanding amount of work that has come. It has been possible to hold an increasing number of meetings without interfering with office routine. In addition to the meetings of the Council, the Trustees, and the Committees, the Board of Directors of the Physicians' Home, Inc., and the Coordinating Council of the five county medical societies of Greater New York meet regularly in the office. The new Tuberculosis Conference Committee set up to speed eradication of tuberculosis in New York State has held one meeting in the office by invitation.

In the course of the year various office systems have been revised so as to do a more efficient job with certain tasks that center in the

office production of the JOURNAL, production of the *Directory*, sale of space for technical exhibits at annual meetings, membership files, roster of all physicians in the state, and the biographical file for the *Directory*. Changes have been made as a result of study by the Council Committee on Office Administration and Policies that was authorized at your last meeting.

As a starter, the business sides of the JOURNAL and *Directory* publication and sale of space for technical exhibits were combined and assigned to Mr. Dwight Anderson as business manager, responsible as such to the Publication Committee and the Committee on Scientific Assembly, respectively. In this way the long experience of Mr. Anderson in publication production has been put to good use. Mr. Kent Lighty and his organization, whose services have been engaged to sell space to advertisers in the JOURNAL and *Directory* and to technical exhibitors at annual meetings, are directly under the management of Mr. Anderson. Financial arrangements with the printers for purchase of paper and billings to advertisers all come into the hands of Mr. Anderson, who has proved himself a tower of strength in the field of business handling of the three tasks.

The previous system of compilation of the *Directory* and the filing systems in that connection and in regard to membership and the alphabetical roster of all physicians in the state came under scrutiny of the Publication Committee. The new auditors, J. K. Lasser & Company, who have expert experience in that field, made an office study of these matters with a view to improvement and possible reduction in cost. It had looked as if the old system would steadily mount in cost. As a result of the study, changes were recommended and installed. Necessarily, there had to be some initial expense—nonrecurrent—to effect the changes, but a definite annual saving in cost of clerical labor to maintain the files and compile the *Directory* is foreseen.

It has been thought well to have a Position Analysis made of individual duties of the clerical force in the effort to save duplication of work, secure most efficient use of time, and systemize remunerations. This has also been done by J. K. Lasser & Company. A report on the subject will be made in the near future to the Office Administration and Policies Committee.

Council Bulletins There has been an unfortunate interruption of the flow of Bulletins of Council Proceedings within the prescribed time—"after each meeting and before the next meeting"—during the past year. Unexpected, new, and demanding matters have interfered, particularly medical preparedness. One bulletin went out for the May and June meetings. It has just become possible to send two more, the one covering the five meetings, September, 1940, to January, 1941, and the other for the February 13, 1941, meeting.

Single matters of pressing nature, it is true, have been made the subject either of special memoranda to the county societies or have been published in the JOURNAL. This, however, does not fulfill the entire obligation and steps are being taken to ensure regular sendings.

REPORT OF THE SECRETARY

707

Coordination of Activities The Council and its committees have continued to function smoothly, wisely, and without overlapping of effort. In a number of instances it has been found worthwhile for two committees, the Public Health and Education Committee and the Public Relations and Economics Committee, to consider, together, subjects of import to both. Thus, different angles of approach have been utilized. Particularly has this method been valuable where conferences were held with representatives of other organizations or government departments. Industrial health, the school health program, laboratory medicine, and other matters have been thus discussed.

Five subcommittees, on School Health Program, Medical Expense Insurance, 4-H Clubs, Maternal Welfare, Medical Relief, also have been hard at work in their special fields as shown in the Council Report. They have proved very helpful to their parent Council Committees.

The Committees on Legislation, Constitution and Bylaws, Malpractice Defense and Insurance, Scientific Program, Scientific Exhibits, Arrangements for Annual Meeting (these last three constituting the "Scientific Assembly" Committee of which the general manager is chairman) have earned on and are carrying on in the regular way. The Advisory Committee on Ophthalmological Problems has been called into action once during the year (see Council Report). The Special Committee of the Society on Prize Essays (Dr Chas Gordon Heyd, chairman, Dr Conrad Berens, and Dr John E Scarff, all of New York) has reviewed five essays and will make its report in person at your meeting on April 29, 1941.

The new Committee on Medical Preparedness went into action immediately after its appointment on June 14, 1940. It has done yeoman work ever since. The headquarters office has given of its best from all hands to help in this emergency work—and has been glad, without reservation, to do its bit. There was first the State Society Questionnaire, then the job of meeting the request from the Governor for nominations for medical examiners for Local Draft and Medical Advisory Boards in the state to be set up under the Selective Service Act when and if passed, these nominations to go through the State Adjutant General's office in Albany and its echelon office in New York City. Both these tasks were undertaken and the office

force has been busy—very busy—with them, both before and since passage of the Selective Service Act. The peak of the load on the office was passed in January last but there is evidently a steady job here that will continue to need not only the attention of the Medical Preparedness Committee but also execution of its behests. Evidently, much remains to be done to help the County Society Committees on Medical Preparedness in their classification of the physicians in their realms as to assignment to civilian practice and as to availability for military medical service now and in case of actual war.

There are two departmental activities of the Society that deserve special mention and special commendation. The one is the work of the Bureau of Workmen's Compensation and the other, the work of the Bureau of Public Relations.

The Workmen's Compensation Bureau, under the industrious management of its director, Dr Kaliski, has continued to work busily for the interests of physicians under the Workmen's Compensation Law. To the House of Delegates, Gentlemen

Your Council has the honor to report on its executive and administrative management of the affairs of the Society during the period following your last meeting on May 6-7, 1940. The various matters before it are here presented in twelve successive parts.

PART I

Postgraduate Education

The keynote of performance of the education duties has been the expansion in amount and kind of postgraduate teaching open to members

of the Society. Following the untimely death on April 12, 1940, of the former Chairman of the Committee on Public Health and Education, Dr Thomas P Farmer, the personnel of the Committee was realigned, as follows

Oliver W H. Mitchell, M D,
Chairman
George Baehr, M D
Charles Dayton Post, M.D

Syracuse
New York
Syracuse

The Council approved the following report which summarizes the work of the year in or-

ganization and presentation of postgraduate medical instruction to the county medical societies and other medical groups

"When the Council Committees were appointed following the Annual Meeting of the Society in May, 1940, the Chairman of the Committee on Public Health and Education called a meeting of the Committee, with the Commissioner of the State Department of Health and representatives of the various divisions having to do with public health problems. The purpose of this meeting was to integrate the work of the Committee with the government agency and each representative of the Department was asked to report on the needs for instruction in his special subject, the preparations of his division to meet these needs, and the financial aid, if any, which the division could contribute to a joint endeavor in this field. In the light of this discussion, plans were made for instruction in obstetrics, pediatrics, tuberculosis, syphilis, rheumatic fever, orthopedics, cancer, and pneumonia, in conjunction with the customary courses on general subjects in all fields of medicine

"Following this meeting, letters were sent to all of the physicians who had arranged courses in previous years, asking their continued cooperation, and suggesting the revision of some courses, in view of changes in personnel, scientific advances, and the addition of some of these new subjects. Meanwhile, letters were also sent to each of the county medical societies, telling of the proposed expansion of the work, the type of course to be offered and requesting that county medical societies desiring instruction notify the Committee as soon as possible, noting the subjects of interest to their members, and the time of year when the lectures would be wanted. Twenty-two requests for information had been received before the *Course Outline Book* was ready for distribution, and since that time, seventeen more requests have been received

"When revision of all the courses had been completed, a second meeting with representatives of the State Department of Health was called to determine the extent of the work and the amount of money necessary to carry it on. At this meeting there was brought up the possibility of arranging whole-day sessions on special subjects, either at teaching centers or State hospitals. Accordingly, there was inserted in the Book announcement of such sessions to be arranged when the demand indicated. As a part of the Defense Program, there was also included in the Book, a list of Plastic and Reconstructive Surgeons, who would give single lectures on this subject to acquaint the general physicians with the advances made in this science. The Book, as published, contained the outlines of forty courses, on the following subjects: dermatology, general medicine, malignant disease, neurology, obstetrics, orthopedics, pediatrics, physical therapy, sanitation and public health, surgery, and syphilis, and, in addition, announcement of Teaching Day plans and single lectures on special subjects, including plastic and reconstructive surgery

"The State Department of Health agreed to carry an item in the budget of \$2,000 for the honoraria to physicians speaking on subjects of a particular public health nature, either in single lectures, teaching days or institutes, with the in-

timization that more money could be obtained if necessary

"When this understanding had been reached, the *Course Outline Book* was mimeographed and bound, and copies were distributed to the county medical societies which had requested them. In addition to these circulating copies, the Commissioner of Health and some of the division directors, the officers of the State Medical Society, and the members of the Committee on Public Health and Education were given copies for reference

"Requests for specific courses were received almost immediately, and since that time this office has made arrangements for postgraduate instruction in twenty-eight county medical societies at an estimated cost of \$3,817.38 to the State Medical Society and \$1,175 to the State Department of Health. As many of these courses are still in operation, the cost cannot be computed exactly. In addition, three county medical societies have requested instruction, and while it is impossible to estimate how much this will cost, it would be unwise to allocate less than \$450 for this work

"The above figures concern courses, and teaching days, held in the local county medical societies. In addition to this work, an Institute on Radiology was held at the Syracuse University College of Medicine, Syracuse, on January 18, 1941, in cooperation with the Central New York Roentgen Ray Society and the Division of Cancer Control of the New York State Department of Health. As its contribution to this Institute, the Committee arranged for publicity, sending notices to all county medical societies, the radiology societies of New York State, the *NEW YORK STATE JOURNAL OF MEDICINE* and the *Journal of the American Medical Association*, the *Journal of Radiology*, *Health News*, and the local press. Invitations were also sent to all radiologists and pathologists practicing in the area of central New York. The Committee paid the expenses of the speakers while they were in Syracuse, e.g., hotel rooms, meals, etc., and arranged a luncheon in their honor. The dinner arrangements were also made by the Committee. Expenditures for this Institute amounted to \$78.37

"The Committee also assisted in arranging an Institute on Pneumonia in Rochester, on January 21, 1941, by publicizing the affair throughout the neighboring counties. The cost was merely that of mailing the notices, approximately \$7.29

"As a part of the Defense Program, the Committee has arranged for a lecture on 'Aviation Medicine,' for the Syracuse Academy of Medicine, to be given by Dr. Louis H. Bauer

"The Committee cooperates with the Sub-committee on Maternal Welfare and incurs some expense in connection with programs, correspondence, and other activities. A regional Maternal Welfare Teaching Day is being arranged to be held in Syracuse on Thursday, April 3, 1941, in cooperation with the Division of Maternity, Infancy and Child Hygiene of the State Department of Health. As with the Radiology Institute, the Committee is arranging the publicity and sending notices regarding this meeting, and will pay the traveling expenses of the lecturers. The State Department of Health will pay the honoraria. A similar regional Maternal Welfare Teaching Day will be held in

Rochester on April 9, 1941 The Committee has assisted with these arrangements and will pay the traveling expenses of the principal speaker

"The Rheumatic Fever program, in cooperation with the State Department of Health, will require considerable attention A recent conference with the government representatives resulted in a very satisfactory understanding regarding the activities

"During the last year there has been increased attention given to Industrial Health programs, and the Committee has conferred with the State Departments of Health and Labor regarding postgraduate instruction Plans are under consideration for expanding this activity and will be announced after further conference with these two agencies

"The many requests for information regarding this work indicate that even with the assistance of the State Department of Health, the present appropriation will probably not permit us to fill the demand for instruction, and at the same time permit us to take part in the Defense Program by presenting other emergency instruction. In the light of these circumstances, an additional appropriation to the Committee should be anticipated, and it is hoped that the Board of Trustees will grant it "

PART II

Public Health Matters

Certain matters that involve in one way or another the health of the public have been considered by your Council. These have been chiefly in the domain of the Committee on Public Health and Education, but frequently the Committee on Public Relations and Economics has been directed to take part in the studies and in actions based thereon.

Maternal Welfare—The Special Committee on Maternal Welfare of the Society (Charles A. Gordon, M D, Brooklyn, *chairman*, James K. Quigley, M D, Rochester, and Ferdinand J. Schoeneck, M D, Syracuse) has been continued as a Subcommittee of the Committee on Public Health and Education, in accordance with your action last year. The work has gone on along the lines then laid down.

A meeting was held by this subcommittee in Syracuse on October 31, 1940, at which were present Drs Gordon, Quigley, and Schoeneck, regional chairmen in Obstetrics, Drs Mitchell, Lawrence, and Irving, and Dr Elizabeth M Gardner, Director of the Division of Maternity, Infancy and Child Hygiene of the State Department of Health. Procedures were outlined whereby these chairmen can function in their regions.

The plans provide for surveys of maternity facilities, for stimulation of county societies in developing a maternal and child health program, for postgraduate refresher courses, for distribution of literature and standards, for accumulation of state and county statistics applicable to the problem of maternal and child welfare, for obstetric conferences in each county or region, for study of neonatal deaths, stillbirths, and particularly the problems of the premature infant.

Regional Chairmen in Obstetrics are
1 New York, Richmond, Bronx.

- George W Kosmak, 23 East 93rd Street, New York
- 2 Kings, Queens, Nassau, Suffolk
Harvey B Matthews, 643 St Marks Avenue, Brooklyn
- 3 Westchester, Rockland, Dutchess, Putnam, Orange
Julian Hawthorne, Highland Hall Apartment, Rye
- 4 Schenectady, Fulton, Montgomery, Schoharie, Greene, Ulster
William M Mallia, 1364 Union Street, Schenectady
- 5 Albany, Washington, Saratoga, Columbia, Warren, Rensselaer
Joseph O'C Kiernan, 496 Madison Avenue, Albany
- 6 Clinton, Essex, Franklin, St Lawrence
Elmer Wessell, 72 Clinton Street, Plattsburg
- 7 Jefferson, Lewis, Herkimer, Hamilton
James L Crossley, 240 Woolworth Building, Watertown
- 8 Onondaga, Oswego, Oneida, Madison, Cortland, Cayuga.
Edward C Hughes, 601 Medical Arts Building, Syracuse
- 9 Broome, Tioga, Chenango, Otsego, Delaware, Sullivan
Stuart B Blakely, 140 Chapin Street, Binghamton
- 10 Monroe, Orleans, Wayne, Livingston, Ontario, Yates, Seneca
Ward L Ekas, 176 South Goodman Street, Rochester
- 11 Chemung, Schuyler, Steuben, Tompkins, Allegany
R. Scott Howland, 531 West Water Street, Elmira.
- 12 Erie, Niagara, Chautauqua, Cattaraugus, Genesee, Wyoming
Robert C McDowell, 40 North Street, Buffalo

The Subcommittee has from time to time supplied special articles on obstetric subjects which have appeared in the JOURNAL.

Pneumonia Control.—This combined effort of the State Department of Health, Medical Society of the State of New York, Metropolitan Life Insurance Company, New York State Association of Public Health Laboratories, Rockefeller Institute, and the Commonwealth Fund has been continued under the supervision of the Advisory Committee on Pneumonia Control of the State Department of Health. Definite decrease in mortality continues.

It is particularly noteworthy that during the year the State Department of Health, with the approval of the Advisory Committee, has been able to make provision for distribution of sulfa-pyridine and sulfathiazole for use in the treatment of pneumococcal infections in *patients for whom the purchase of the drug would prove a hardship*. Thus the cost of both serum therapy and chemotherapy for pneumonia is now underwritten by the State of New York from tax funds.

4-H Clubs.—Through another Subcommittee of the Committee on Public Health and Education, the Council has made contact for the State and County Societies with the 4-H Clubs of the state, which have a combined membership of over 31,000 boys and girls from rural districts.

Dr J G Fred Hiss, of Syracuse, the chairman, who has been continuously active during the year, is discussing with this organization the possibility of promoting among the members of the 4-H Clubs a health program that might perhaps, if found useful, be later applied to other youth organizations of the state, such as the Boy Scouts and the Girl Scouts

With the approval of the Council, Dr Hiss has taken up with the organizations and with the State Departments of Health and of Education a suggested health program that would involve the following main factors

- 1 Annual complete physical examinations to be done by the member's own private physician and recorded on standard forms These reports to be brought by members to the County 4-H agents
- 2 Follow-up by County 4-H agents as to correction of recorded defects
- 3 The Most Perfect Boy and Girl Contests The County Medical Societies to help through their committees in finding member physicians to re-examine for contest purposes those chosen as candidates as health perfect.
- 4 While the annual examinations should be, in the opinion of the Society, paid for by the 4-H Club member, these later contest re-examinations could well be done without fee
- 5 An educational program on medical matters to come to County 4-H agents from the State Department of Health and County Societies
- 6 The entire program to be directed jointly by a committee upon which would be represented the 4-H Club agents association, the State 4-H Club office, the State Department of Health, the State Medical Society, and the State Department of Education

Much interest has been reported in these suggestions At the Buffalo meeting, in the Section on Public Health, Hygiene and Sanitation, there will be a symposium on Health Education for Youth Organizations at which they will be discussed

Proposed Medical School in New York State—The Council received an invitation from the Board of Regents of the State Department of Education to attend a hearing on June 20, 1940, on an application pending before that Board for a new medical school to be known as the "Gorgas Institute," to be located in the Borough of Manhattan The Council directed that the Committees on Public Health and Education and on Public Relations and Economics accept the invitation and oppose granting of the charter

The hearing was attended by Drs Mitchell, Hambrook, Lawrence, and Irving, who put the Society on record as instructed The Board of Regents postponed action on the application

Public Health Laboratories.—A committee of the New York State Association of Public Health Laboratories requested a meeting with the Chairman of the Committee on Public Health and Education regarding a memorial which was submitted to our Council last year It was agreed that this memorial be revised and re-submitted This was done, and a part of the understanding was that the revision, with its accompanying proposals, was to be printed in

the JOURNAL The proposals referred to are the following

- 1 That the Council of the Medical Society of the State of New York arrange with the New York State Department of Health for the distribution of pertinent information concerning approved laboratories to every physician in the state
- 2 That the director in charge of a public health laboratory submit regularly to the appropriate committee of the county medical society, a report with explanatory comments and discussions of the examinations performed during the period
- 3 Such reports should be reviewed at meetings of the county society to familiarize the physicians with the services available, with accompanying remarks concerning the use or lack of use of laboratory facilities
4. That at least once a year, or more often if indicated, representatives of the Council of the Medical Society of the State of New York, of the Division of Laboratories and Research of the New York State Department of Health, and of the New York State Association of Public Health Laboratories confer regarding public health laboratory service in the state and discuss ways and means of improving it
- 5 That the Medical Society of the State of New York publish in an early issue of the JOURNAL the above statement with its accompanying proposals and that from time to time, other articles or news items be published in the JOURNAL concerning public health laboratory facilities in the State of New York

Laboratory Medicine—The House passed to the Council the following resolution

"Be It Resolved That

- 1 The House of Delegates go on record as disapproving laboratory medicine by laymen or nonmedical personnel
- 2 That measures for establishing a proper relationship between city and state departments of health laboratories and physicians who practice pathology be endorsed
- 3 That the work of state and city departments of health be limited to the diagnosis of communicable diseases except where the diagnostic facilities of state and city health departments are the only diagnostic means available for indigent patients"

Conferences have been had with representatives of the Joint Council on Pathology, Radiology, Anaesthesia, and Physical Therapy in the effort to clarify the situations which the resolution seeks to adjust

Particularly in regard to the proposed limitation of service by government-operated public health laboratories was there much discussion It is planned that, in order to work out a better understanding the Committees on Public Health and Education, and Public Relations and Economics have a conference with representatives from the State Department of Health, the Joint Council on Pathology, Radiology, Anaesthesia, and Physical Therapy, and the State Association of Public Health Laboratories

Tuberculosis Conference Committee—A new committee came into being under the auspices of the State Department of Health for the pur-

REPORT OF THE COUNCIL

pose of promotion of "activities looking toward the intensification of services for the control of tuberculosis in Upstate New York." As constituted, it has on it the Commissioners of the State Departments of Health, Social Welfare, and Mental Hygiene, representatives of the State Charities Aid Association and the Metropolitan Life Insurance Co., and Dr. Irving was invited to sit as representing the State Medical Society. Dr. Irving accepted with the approval of the Council.

The objective of this committee is the eventual eradication of tuberculosis from the State of New York. It was first given the name of the "Tuberculosis Cooperating and Coordinating Committee," but this it later changed to that of the "Tuberculosis Conference Committee." It has held to date (March 15, 1941) three meetings, the second of which was, on invitation, at the Society's New York office. At that meeting, on request of Dr. Irving, the members of the State Medical Society's Committees on Public Health and Education, and Public Relations and Economics, were invited to sit in and discuss ways and means of speeding up con-

Particularly, stress was laid on the need for examination and x-ray of more "contacts" of registered cases. The Council, at its February 13, 1941 meeting, heard and discussed with Dr. Robert E. Plunkett of the State Department of Health, General Superintendent, State Tuberculosis Hospitals, the existing facilities and possible expansion of this work. The Council referred this problem to its Committees on Public Health and Education, and Public Relations and Economics, for study and report.

Tattoo Code for the Serum Sensitive—Two of those injured in the train wreck at Little Falls, New York, in April, 1940, were found sensitive to serum when the physicians came to administer tetanus antitoxin. From this experience was born the idea that it might be useful if a practice be established and commonly accepted to put a tattoo on the bodies of such people. This would perhaps even save life. Carrying the idea on, the physicians concerned thought also of tattoo marks to indicate diabetes and epilepsy.

After study by its Committee on Public Health and Education, the Council went on record as not approving such a code on the grounds that it would not be readily accepted, could not be made compulsory, and could, and probably would, be subjected to improper use. The Council does advocate identification by cards or tags carrying authoritative information.

Demolition of Manhattan State Hospital—The attention of the Council was called to a growing opposition to demolition by 1943 of this State Hospital for Mental Disease on Ward's Island, New York City, as provided in an Act passed in 1933 by the Legislature. A hearing on the matter was held by the State Temporary Legislative Commission to Formulate a Long Range State Health Program on February 7, 1941.

Dr. Irving attended that hearing and reported that the Department of Mental Hygiene was in opposition because its other hospitals are already badly overcrowded and it would not know where to send the 2,400 patients now in

the Manhattan State Hospital. The New York City Welfare Council and the New York Academy of Medicine registered opposition, as well as the State Charities Aid Association. The Council considered this matter, involving as it does overcrowding of mental hospitals in the State, of sufficient importance to refer it to its Committees on Public Health and Education, and Public Relations and Economics, for study and report.

PART III

School Health Program

Following your last meeting, the positions taken were transmitted through the Committee on Public Health and Education to Commissioner Ernest E. Cole of the State Department of Education and later to the members of the Board of Regents. Therefore there can be no misunderstanding as far as the State Medical Society's standing is concerned.

At that meeting the following conclusions reached by the Council were approved by the House

"That work in the schools that is distinctly of a medical nature should be under the direction of a physician who should be responsible to the executive administrators or school board, and not to them through an intermediary person who is not a physician while matters of an educational nature should be in the hands of those who were trained to be teachers."

"That the aims of School Health Service should be to provide the best type of health service possible for all school children, whether attending public or private schools, in order to impress on the child what should comprise good medical care, and that the advice given to children should be based only on complete and careful examination."

Also the following recommendations were adopted by the House

"That a change be made in the organization of the present Division of Health and Physical Education, preferably that the present bureau of health service be transferred to the State Department of Health, but that if this is not possible, such a division be organized in the State Department of Education, and that to it be assigned all medical problems, while the teaching of health, including physical education, be left, as at present, in the Division of Physical Education of the State Department of Education, so that the teaching of health would be in the Department of Education, as heretofore, while the supplying of health service would be either in the State Department of Health or in a separate division headed by a medical man."

"That in the administration of Health Service in the schools, the employment of private physicians be encouraged wherever possible."

Into this picture there came last fall a meeting of the Regents' Advisory Council, at which Dr. Hambrook represented the State Medical Society. That body passed two recommendations to the Board of Regents on which Dr. Hambrook found it necessary to ask that his

opposition be recorded as a minority report. This action on the part of Dr Hambrook was endorsed by the Council.

One of those recommendations was in opposition to the stand of the Society in favor of division of the Health and Physical Education services into two departments, or transfer of the health service to the Department of Health. The other was against the stand of the Society that the separate Health Service division be headed by a physician.

Dr Hambrook later received a letter from Commissioner Cole in which he said:

"At the meeting of the Regents which occurred the day following the discussion of the health program by your Council, they provided for a permanent Committee of the Board of Regents and also appointed a temporary Commission of five members, headed by Mr Young, to give immediate attention to the health program as requested by the Governor.

"I want to take this occasion to thank you for your interest and assistance in the development of this most important phase of education."

Into this picture came, also during the winter, proposed federal legislation on physical education in the shape of the so-called Schwert Bill. This bill was replaced by a new Schwert Bill which radically changed the original bill to omit reference to medical and health activities, but the Council went on record as opposed to the bill as unnecessary federal legislation and generally undesirable.

The problem of improvement of the present school health program in New York State remains unsolved. The Council, considering the matter of prime importance, last June created a Subcommittee on School Health Program of the Committee on Public Health and Education to study and advise. This Subcommittee consists of:

E Christopher Wood, M D, *Chairman*

Albert D Kaiser, M D	White Plains
A. Clement Silverman, M D	Rochester
	Syracuse

Future Dental Health—The Council has considered that in the school health program particular attention is needed to insure better dental health than now exists. The large number of rejections in the present draft, because of dental defects, necessarily harks back to dental care, prenatal and in infancy and childhood. The Committee on Public Health and its Subcommittee on School Health Program, with the Committee on Public Relations and Economics, have taken up this matter in conference with representatives of the Dental Society of the State of New York. On February 25, 1941, the conference was held, at which were present:

FOR THE MEDICAL SOCIETY

Oliver W. H. Mitchell, M D
George Baehr, M D
A. Clement Silverman, M D
Louis H. Bauer, M D
Samuel J. Kopitzky, M D
Peter Irving, M D
Laurence D. Redway, M D
Dwight Anderson

FOR THE DENTAL SOCIETY

Charles A. Wilde, D D S
H. S. Dwyer, D D S

After a discussion covering many points, this

group decided to recommend to both the parent organizations that a joint committee be created by appointment of three physicians and three dentists to act as a continuing committee to work out a future dental health program by the closer coordination of medical and dental society effort. The Council approved the setting up of such a joint committee, and the Secretary was instructed to so advise the Dental Society of the State of New York. The selection of the State Medical Society members of this joint committee will be made at the meeting of the Council on April 29, 1941.

Eye Care Survey in Public Schools of the State—The State Department of Education received a request from the American Optometric Association for permission to make a survey of eyesight in the public schools of New York State. The Department asked the opinion of the State Medical Society through Dr Hambrook, as Chairman of the Council Committee on Public Relations and Economics. Dr Hambrook brought the query to the Council, which immediately passed it on to its Advisory Committee on Ophthalmology Problems.

Conrad Berens, M D, <i>Chairman</i>	New York
H. W. Cowper, M D	Buffalo
Thomas H. Johnson, M D	New York
Searle B. Marlow, M D	Syracuse
Albert C. Snell, M D	Rochester

The Advisory Committee recorded its unanimous opinion that such a survey should be made only by medical men—ophthalmologists. This opinion was sent, with the approval of the Council, to the State Department of Education.

PART IV

Publications

Experience, literary and financial, for production of the NEW YORK STATE JOURNAL OF MEDICINE during the calendar year 1940 is most encouraging for the future. Production factors of the *Medical Directory of New York, New Jersey and Connecticut* 1939-1940 edition have been made the subject of close study. As a result it is expected that the issue to appear on October 1, 1941, will be more satisfactory as to text and as to cost.

It has been found effective to vest responsibility for the conduct of JOURNAL and Directory production in a local Council Committee on Publication of five, consisting of the General Manager, the Business Manager of the JOURNAL and Directory, Literary Editor, the Treasurer, and a member of the Board of Trustees. This Committee has been able to meet on short notice and to decide various questions with despatch.

Journal—From the editorial angle it can be reported that the current of articles submitted has continued at the high level of a total for 1940 of 285. During the year there were published 229 scientific articles with a total of 1,240 pages.

Other text content has included Editorials, Medical News, Hospital News, Books, Medical-legal, with the addition of Sections on Public Health News, Maternal Welfare, Medical Relief and Society activities of special import on various subjects. There have been added two new scientific sections to run at intervals, the one entitled "Therapeutics" and the other, as a companion piece, "Diagnosis."

REPORT OF THE COUNCIL

713

The section on "Therapeutics" reports Conferences on Therapy held regularly at the Cornell University Medical College between the Departments of Medicine and of Pharmacology, under the chairmanship of Dr. McKen Cattell. In the Section on Diagnosis, two hospitals supply similar conference discussions of cases where diagnosis has been checked with pathologic autopsy reports. One is from the New York Post-Graduate Medical School and Hospital under the chairmanship of Dr. Irving Wright, and the other from the Fourth Medical Division of Bellevue Hospital under the chairmanship of Dr. Charles H. Nammack.

It has also been arranged to publish the Transactions of the meetings of the New York Pathological Society. Previously these have appeared in the *Archives of Pathology*. The Publication Committee accepted the offer of these, not only because the cost of printing will be met, but because it felt that pathology is basic for all medicine—clinical and research. It is glad to have these Transactions for the JOURNAL's large circulation—now 18,343.

The format with the beginning of 1941 was changed considerably in order to have a more readable type with more words per page. In this way the text content is being increased and the greater demands for space met in part, at less cost than if the former style of type were used.

Financially, the Council is happy to report the experience for 1940 has been gratifying and the promise for the future attractive. In 1939 the total net cost was \$24,391 97 while in 1940 it dropped to \$15,391 32. In 1939 the cost per member (using the average figure for membership—16,594) was calculated at \$1 46. For 1940 the corresponding figure (average membership 17,087) was only 90¢.

This satisfactory result was obtained under the management policy of the Society of maintenance of a business department for the JOURNAL which addressed careful attention to the details of its administration. Pursuant to this policy it has been possible to accomplish savings in production expense on a threefold basis, fewer pages per issue (total 2,400 instead of 2,800), savings in printing cost by 5%, and lower cost of paper since purchased by the Society. Coupled with these savings the net income from advertising has materially increased.

Considering this favorable financial situation and evidence at hand of future augmented advertising income, it was decided late in 1940 to increase the size of the JOURNAL in 1941 by sixteen pages—112 instead of ninety-six. The typographical changes recorded above aid in giving space to more text content. It is the hope of the Council that with continuance of management along these effective lines, the JOURNAL may reach a point of paying its own costs and perhaps even be a source of future revenue to the Society.

Directory—The final total cost of the 1939-1940 Directory was \$20,010 40 or about 95¢ per volume on a 21,000 print order. While the book contained ninety-six more text pages and twenty-eight more advertising pages, it was thought that savings could, in the future, be accomplished by revision of the previous system of compilation, which had been built originally on production of

a much smaller and less pretentious volume. Savings in production costs and increase in income had been thus offset in cost of compilation. After study by experts the system of compilation has been so revised as to promise savings in producing copy, using punch-card devices for saving time and avoiding errors. Text matter will go to the printer on cards in better condition for composition. Much time and expense of compilation should ultimately be saved by use of these modern methods.

At your last meeting you authorized addition of data under physicians' names of hospitals of internship and residency. A further study of this plan convinced the Council that the cost of this additional data was sufficient to justify the omission in the 1941 edition. The total number of physicians, most of whom would have had one or more designations, listed in the 1939-1940 edition was

New York State
New Jersey
Connecticut

24,777
5,332
2,500
32,509

The cost of printing and paper would have been much increased.

Criticism of the last edition has been received because of the shift of the New York City Boroughs from the front of the book to its natural alphabetic position under the letter N. On investigation the difficulty seems to be that what caught the eye at the top of these pages was not the name of the town, New York City, on the left-hand page, but the word *Borough* (of Bronx, Brooklyn, Manhattan, Queens, or Richmond, as the case might be). This it is planned to remedy by running the name of the town on each page in capitals—NEW YORK CITY—and then, after a dash, Borough of Bronx, etc., in capitals and lower case.

Medical Publicity

The year just passed has been one of continuous and regular publicity of a positive character to interpret the activities of organized medicine in New York State to the public. The importance of the medical profession in the daily lives of the people is a matter they are prone to forget unless they are reminded from time to time by the recital of concrete matters in which the profession is importantly concerned on their behalf.

Due perhaps to defense preparations, the issue of socialized medicine has been momentarily placed in the background in the public mind, and unless and until it becomes a matter of pressure for legislation, and concurrent publicity by its exponents, the ammunition stored by the Public Relations Bureau in the six years of its existence remains in reserve. In this respect the Bureau may be considered as insurance against surprise attack.

To be in greater readiness should the need arise, our direct mailing list has been increased by making addressograph stencils of more than 5,000 new names of important key laymen throughout the state. In this, the help of county society secretaries has been invaluable. The list is locally hand-picked. We now have an exceptionally well-chosen list to whom our printed matter may be sent.

During the year, releases to the daily press of

the state were issued concerning the district branch meetings. Special ready-to-print plate matter was provided to 281 weekly newspapers in the various districts.

Special releases went to the press concerning the postgraduate courses conducted by the Council Committee on Public Health and Education. These related to courses held in the following counties: Chemung, Chenango, Columbia, Dutchess, Fulton, Genesee, Madison, Monroe, Nassau, Oneida, Onondaga, Oswego, Otsego, Rockland, Saratoga, Schenectady, Tioga, Tompkins, Wayne, and Wyoming.

A release to the press was issued concerning the Radiology Institute, held at Syracuse on January 18, under the auspices of the Central New York Roentgen Ray Society, Medical Society of the State of New York, Syracuse University College of Medicine, and the Division of Cancer Control of the New York State Department of Health.

The physician's importance in defense was indicated in a release concerning the issue of the JOURNAL for July 15, a "Military Medicine" number. The fact that army rejections did not signify that the American people are receiving insufficient medical care was the subject of another release based on an editorial in the February 1 issue of the JOURNAL. This was widely used by newspapers throughout the state. Clippings kept in scrapbooks in the office of the Bureau reflect the use of this material.

A report on the progress of medical indemnity insurance was presented to the Council at its February meeting, and on the following day, at a meeting of county society legislative chairmen at Albany, the material was presented again, and released to the press throughout the state.

The Bureau cooperated in obtaining publication in the *Journal of Living* of an article by Dr. Samuel J. Kopetzky, answering one by Robert Wagner, Jr. Reprints of this article were distributed to our direct-mail list.

The Bureau assisted the publishers of the *Nation's Business* in the preparation of an article, "The Case for Private Medicine." Reprints of this article were distributed.

A condensed version of an article appearing in the JOURNAL, "Give the Doctor a Break," by Dr. Floyd Burrows, was made ready for distribution March 1. It is expected that part of the stock of 60,000 will be used to fill orders from medical organizations outside the state which have indicated an interest in this article.

Reprints of scientific papers appearing in the JOURNAL on human refrigeration were published in a single document primarily to be offered as a premium to new subscribers to the JOURNAL. Enough copies were secured to enable the Public Relations Bureau to send one to each of the 200 libraries in the state. A surplus remained of copies of the *Directory* of New York, New Jersey and Connecticut over the number needed for our use, an offer was made to newspaper editors and librarians in the state to send a copy free on request. More than 300 requests have been filled.

Reprints of "A Study of County Society Activities," by Dr. Joseph S. Lawrence, were made from the January 15 issue of the JOURNAL and supplied to all libraries in the state, presidents and secretaries of county medical societies, and to others on request.

"Club Talks" formed a new type of bulletin started in October, 1939. It is designed to provide speakers before luncheon groups, women's clubs, and civic organizations, with prepared material on various aspects of health. The idea was suggested by Mr. James E. Bryan, executive secretary of the Westchester County Medical Society, who obtained the cooperation of women's club groups throughout the state in the distribution and use of the material. Mr. Bryan's assistance in the preparation of the material was a notable contribution to the work of the Bureau during the year. The issues have included the following subjects: "Mental Health in Childhood," "What Everyone Should Know about Cancer," "Pneumonia and the Common Cold," "Rheumatic Heart Disease," "Preventive Medicine and Child Health," "Tuberculosis," and "Maternal Welfare."

Pursuant to the mandate of the House of Delegates to engage in radio activities, the Public Relations Bureau first made a study of the use which medical organizations already have made of radio. Questionnaires were sent radio station directors throughout the country, and a bulletin issued, "The Doctor Takes to the Air." The findings are best described in the following quotation from the *Service Bulletin* of the Federal Radio Education Committee:

"The Medical Society of the State of New York has tested the success of the radio efforts of doctors by sending a questionnaire to radio stations. The questions and the answers from 376 stations are brought together in a 28-page script. Many of the questions are of interest to educators.

"In brief, the stations, in their replies, stated (1) that material should be presented in a way to satisfy professional radio requirements as to dramatic values, (2) that medical societies are cooperative in providing speakers, (3) that medical speakers are interesting to a substantial portion of the radio audience, and (4) that medical programs may be improved by recognizing (a) that radio is more a stimulus to further thinking and reading than as a means of conveying information, and (b) that the successful use of radio for education challenges many time-honored traditions of the classroom, including the professor's 'sacred right to be dull'.

"The script is available on loan through the Educational Radio Script Exchange, U. S. Office of Education, Washington, D. C."

Correspondence with educators, radio officials, medical organizations and others resulting from the distribution of this bulletin fully corroborates our belief that the approach to the effective use of radio can best be made in an entirely different way than through the conventional "health talk" by a physician. It is not intended here to minimize the value of these talks, but to point out that they fall far short of achieving all the possibilities that radio holds for medicine. It should be mentioned, in passing, that the ultimate effect of much of medical use of the radio has been indirectly to encourage self-diagnosis and self-medication. The technic employed has been far too heavy, and talks have contained too much closely packed information, impossible of assimilation by the average radio audience. Studies recently made by the Rockefeller Foundation and others point out specifically how ineffectual is much that has passed for radio

education in the last ten years. Whether radio is at all a suitable educational instrument used alone, or whether it does not function better as a device for arousing interest to be further satisfied upon inquiry, is one of the important questions involved in forming a program policy. The Public Relations Bureau inclines toward the latter view.

Radio talks given in the past by many organizations have been placed at our disposal for study. It has been decided to utilize none of this material which is mostly of the conventional type. Rather, we are going on the air with a goodwill program, not to attempt what has been called "low-grade academic talks," but to present a public relations program of the Medical Society of the State of New York interpretative of the physician in terms of the public's faculty of understanding and appreciation. To this end, a dramatized half-hour evening program has been arranged, "Doctors for Defense," on a local New York station. It is expected that this program will become national after an experimental demonstration to determine the degree of audience response.

Wide publicity will be given this program both by direct mail on our part, and newspaper publicity by the radio station. The scripts will be made available to other medical societies through our bulletin service with permission to produce them in cooperation with local college classes in speech and radio.

Mr. Anderson, director of the Public Relations Bureau, participated in a radio program over radio station WOR with Dr. David Ulmar, assistant clinical professor of medicine, Post-Graduate Medical School, and Mr. Frank Kierman, director of the New York Tuberculosis and Health Association.

What It Means to Be a Doctor, of which 12,000 copies were printed in May, 1939, has met with a lively demand from every section of the United States. It was published in two formats: 9,000 paper-bound copies and 3,000 cloth-bound. The paper edition is now exhausted. Of the cloth edition, 1,010 copies remain. The cost of printing this book was \$1,869 01, income from sale of copies has been \$2,429 15, leaving a surplus of \$560 14 over the cost of printing.

Material is now being gathered for a companion book to *What It Means to Be a Doctor*, to be written by Mr. Anderson and to be ready for publication in the late summer of 1941.

Supplies of *On the Witness Stand* are on hand for wide, free distribution in the event of active agitation for compulsory health insurance. This edition, the second of the pamphlet, has sold 42,554 copies, and free distribution amounts to 14,550 copies. Charges for printing and promotion were \$2,576 58, income \$1,978 08, leaving a current deficit of \$598 35, which is more than covered by the value of the stock on hand.

Mr. Anderson was a guest of the Michigan Medical Society at its annual meeting in Detroit, September 24-27, 1940. He spoke on the subject of public relations before the Michigan House of Delegates, a county secretaries' meeting, and a meeting of physicians' office secretaries. The Michigan society decided at this meeting to organize a public relations program. Mr. Anderson also attended, during the course of the year, the District Branch meetings, the Health Officers conference at Saratoga Springs,

meetings of the Tuberculosis Coordinating Committee, and the usual stated meetings of the Council and Council Committees. In August, 1939, he attended an Institute for Organization Executives held under the auspices of Northwestern University at Evanston, Illinois.

Throughout the year much of the time of the Director of the Bureau has been engaged in conferences with the persons calling upon the Bureau for information, or for assistance in furthering projects of such a character that his cooperation with these persons inured to the benefit of the medical profession. He has also participated in the study of office administration authorized by the House of Delegates, having been designated as a member of the committee appointed for this purpose. His activities as business manager of the *JOURNAL*, *Directory*, and Technical Exhibits are not included in this report but the comment is pertinent that these activities have contributed to the facilities for handling public relations, both by increasing the director's personal contacts and by making possible a higher degree of coordination of the various activities in which he is engaged.

PART V

Medical Expense Insurance

The Subcommittee of the Council Committee on Public Relations and Economics set up in 1939 to study and advise on Medical Expense Insurance was continued by the Council (Herbert H. Bauckus, M.D., Buffalo, *Chairman*; Walter T. Dannreuther, M.D., New York; William Hale, M.D., Utica).

The Council received and approved the following report of the activities and opinions of this Subcommittee:

"Nonprofit Medical Expense Indemnity Insurance was approved by the House of Delegates of the American Medical Association at a special session held in September, 1938. The report of a special committee, unanimously adopted by that House, stated certain important policies and principles set forth as follows:

"Under Recommendation IV on a General Program of Medical Care Your committee approves the principle of hospital service insurance which is being widely adopted throughout the country. It is susceptible of great expansion along sound lines, and your committee particularly recommends it as a community project. Experience in the operation of hospital service insurance or group hospitalization plans has demonstrated that these plans should confine themselves to provision of hospital facilities and should not include any type of medical care.

"Your committee recognizes that health needs, and means to supply such needs, vary throughout the United States. Studies indicate that health needs are not identical in different localities and therefore they usually depend on local conditions and are primarily local problems. Your committee therefore encourages county or district medical societies, with the approval of the state medical society of which each is a component part, to develop appropriate means to meet their local requirements.

"In addition to insurance for hospitalization, your committee believes it is practicable to develop cash indemnity insurance plans to cover, in whole or in part, the costs of emergency or

prolonged illness. Agencies set up to provide such insurance should comply with State statutes and regulations to insure their soundness and financial responsibility and have the approval of the county and state medical societies under which they operate.

"Your committee is not willing to foster any system of compulsory health insurance. Your committee is convinced that it is a complicated, bureaucratic system which has no place in a democratic state. It would undoubtedly set up a far-reaching tax system with great increase in the cost of government. That it would lend itself to political control and manipulation there is no doubt.

"Your committee recognized the soundness of the principles of Workmen's Compensation laws, and recommends the expansion of such legislation to provide for meeting the costs of illness sustained as a result of employment in industry.

"Your committee repeats its conviction that voluntary indemnity insurance may assist many income groups to finance their sickness costs without subsidy. Further development of group hospitalization and establishment of insurance plans on the indemnity principle to cover the cost of illness will assist in solution of these problems."

In November of 1938 the Council of the Medical Society of the State of New York advised its component Medical Societies that it had taken action as follows:

"Placing the Society on record as in full accord with the recommendations adopted by the Special Session of the House of Delegates of the American Medical Association of September 16, 17, 1938, including that favoring cash indemnity insurance for medical expense.

"Approval of the principle of non-profit cash indemnity medical insurance.

"Instructions to the Legislative Committee to support legislation for amendment of the insurance laws which would permit non-profit cash indemnity medical insurance."

Legislation introduced at the request of the New York State Department of Insurance, and supported by the State Medical Society, known as Article IX-C, effected an enabling act for non-profit medical expense insurance under the Insurance laws of the State of New York.

The 1939 House of Delegates of the Medical Society of the State of New York adopted the following:

"Tentative Basis and Suggestions for Medical Indemnity Expense Insurance"

- 1 It must be nonprofit
- 2 It should involve cash indemnity and not medical service
- 3 Patients must have absolute freedom of choice in selecting a duly qualified physician from all those qualified to practice and willing to give service within the locality covered by the operation of the company
4. No third party may be permitted to come between the patient and his physician in any medical relation. The method of providing service must retain a permanent confidential relation between patient and the physician
- 5 The fees should not be below those of the workmen's compensation schedule, but

there must be no interference with higher fees being charged the higher income groups

- 6 All features of medical service must be under the control of the medical profession, such control to be exercised by or under the direction of the Medical Society of the State of New York or one of its component county societies
- 7 The eventual aim of any plan should be to cover medical care in the office, home, and hospital

"The Council further directed its Committee on Public Relations and Economics to study this subject, and it gave its approval to the appointment by the president of a special subcommittee to assist and advise with county medical societies who may wish to effect creation of non-profit organizations for medical expense indemnity insurance under Article IX-C of the amended Insurance Law of the State. Notification of this action was promptly made to each county society. To each county society secretary was mailed a sample pamphlet or prospectus believed to present a practical outline for organization. The Committee realized that lack of suitable statistics based on experience greatly increase the many problems of organization and attempted to provide to interested groups such information as it could obtain. However, it governed its conduct in accordance with the wisdom of Article III of the platform of the American Medical Association, viz, 'The principle that the care of the public health and the provision of medical service to the sick is primarily a local responsibility'.

"Thus did the Medical Society of the State of New York cooperate to place before the people of its state an opportunity to study, evaluate, and possibly buy, Non-profit Medical Expense Indemnity Insurance. It encouraged the formation of local plans sponsored by trusted and well known persons in a community. Some of these organized to form a company prepared to operate in a practical manner this business of prepayment for medical care. Many other groups, and these also represent a cross-section of the local personnel, are still studying and weighing numerous questions pertinent to the desires and necessities of the local public interest.

"The board of trustees operating a plan of medical expense indemnity insurance maintains both lay and professional representation on its membership. Subscribing to this provision it may be pointed out that the interested citizens of a community, especially those desiring to promote the insurance of medical care, may combine with the medical profession to set up a working plan. The fields of insurance, legislation, social work, and industry may be regarded as logical sources for this personnel.

"Such administration—the State Departments of Insurance and Social Welfare, the lay and professional membership in Boards of Trustees—guarantees protection to the subscribing public.

"It should be made clear that the aim of the present plan of medical expense indemnity insurance is to give a certain proportion of our lower income working population the opportunity to save for, or prepay for at low rates, adequate medical care, and especially to provide for the costs of serious, catastrophic illness. In this way

it may do much to eliminate the need for medical relief—but it of course cannot at this stage provide medical care for those who have been indigent to the extent of being unable to pay even a small insurance premium. However, experience with medical expense indemnity insurance may lead to practical systems which allow the indigent patient to secure first-class medical care and which will not remove from him his prerogative of being the employer of his family physician. It appears that all concerned are desirous of not permitting any third party to come between the patient and his physician in relation to purely professional medical care.

"Because of the lack of actuarial data it has been most difficult to determine what rates of insurance premiums should be charged, what services should be included, and which omitted from the insurance contracts. It is apparent from the set-up of present plans that for the duration of each contract the medical profession is prepared to render its services to the full, in some instances accepting payment on a unit ratio basis.

"There has been some reluctance on the part of physicians who were afraid that medical indemnity insurance corporations might not be sufficiently equipped, or informed with sufficient actuarial data, to render the best type of service to the sick. The varying population concentration in the state has made this much more of a problem in some localities than in others. In the main, however, physicians are quite willing to take part in well organized and responsible plans which have the respect of the community. Where plans have been offered for sale in New York State, the response on the part of the public to buy, has, on the whole, been slow. This is an advantage to the managers of a plan, so that they may gain their experience with smaller subscriber numbers, but of course the object of their business bespeaks continued expansion.

"It may be well to coldly analyze this proposition of the reluctance on the part of the public to buy medical expense indemnity insurance. Some of these reasons may be set forth as follows

1. First and foremost, the people of the United States have always been able to secure medical attention from practicing physicians whether they had the money or not. It may be stated that of all the necessities that the human must have, he can secure religious service and medical care easiest and most certain of all. Someone must pay for food, housing, fuel, clothing, and hospitalization, but practically every patient without cash can secure adequate medical care. Therefore it does not appear to the prospective patient that he is so much in need of insurance to pay the cost of medical care.
2. Many people of the low income group feel that they can afford to buy only one, either a hospital, or medical care, insurance contract. Most patients will feel that if they can have their hospital care provided, they will find a physician to take care of them. They fully intend to pay for both, but the experience of the public has been that they may later on pay for medical care while hospital care is often a proposition where payment is demanded a week in advance. This statement is made with no reflection

on hospital methods inasmuch as hospitals, to maintain themselves, must receive revenue. The same may be said of physicians, but the physician has much more personal relationship with the patient than does the hospital.

3. There are many who, having a regular small amount of cash, prefer to buy life insurance with this amount. There is, of course, no argument against proper protection with life insurance. It may be that after all other bills, especially those incidental to the immediate death, are paid, that some part of such fund may be used for payment of medical care. This is again no reflection on the insured, custom has decreed quite well the relative order in which these funds will be used. It takes salesmanship and some persuasion to sell even small amounts of life insurance.
 4. Advertisement by means of the personal agent, radio, and printed word offers strong inducement to the apparently well person to spend his or her money for the thousand and one necessities and luxuries of our everyday life. This competition is quite too strong to allow a universal system of saving money to pay for medical care when no signs or symptoms of illness appear on the horizon. In fact, this competition has gone to the point where the individual has borrowed and is considerably in debt for many of the things he claims to own. It is manifestly quite difficult to lay aside money for medical care when the installment payment is pressing. Those who press for installment payments have a more successful way of achieving their ends than do those who would make the health consideration of the individual their first object.
 5. The American, having been accustomed to rather independently employ his physician, looks somewhat askance at these plans for medical expense indemnity insurance, asking the questions—Am I sure to get the doctor of my choice? Is this a panel system? Are the physicians going to be interested when working on a group basis? Are inexperienced people experimenting with our medical care? When the corporation grows, will it gain some political influence which will lead to political manipulation within and without? The answers to these questions may be easily made when the method of procedure adopted by the New York State Medical Society is understood, but it will take time before the public will have a full confidence in these plans.
 6. When business is good and people generally are working, the worker has little trouble in paying for medical services and will not worry much about this when he and his family are well. When he is out of work, then will arise the difficulty of securing funds to pay for medical insurance premiums.
- "There are those who, with every good intent for the welfare of both the public and the medical profession, have stated that if non-profit medical expense indemnity insurance is not made to work by the medical profession, then we must have compulsory health insurance. In discussing this subject, I would like to call attention to items 1 to 6 stated immediately above.

"Are we to discard our present tried and constantly progressive system of caring for the health of our people for one of experimentation with compulsory health insurance because the present experiment of medical expense indemnity insurance does not immediately or at any time prove successful? If there is a 'blame' for non-functioning of medical expense indemnity insurance, shall it be fastened entirely upon the medical profession? Experienced private corporations have for years studied and put into effect systems designed to pay for the cost of illness and accident. Because they did not succeed in covering the entire fields, did that appear an immediate argument for compulsory health insurance? The medical profession has welcomed the aid of all in the promotion for adequate medical care. I think the objection on the part of some prospective buyers of medical expense indemnity insurance is an eloquent answer to the claim that the public wants compulsory health insurance. If they do not want insurance voluntarily, shall they be made to 'like it' compulsory? Although discussion has brought forth a clearer understanding of the subject, the recent preparations for national defense have emphasized the difficulties of a mass change in our national efforts. We study the efforts of government and industry to prepare for national defense—how difficult it is to quickly manufacture munitions, aeroplanes, and ships, how difficult to assemble and employ the personnel of our industrial plants and our Army and Navy. We hear of 'bottlenecks', and there appears to be a great deal of sharp political jockeying and division that holds up administrative policies, and that possibly weakens the bulwarks of our nation's safety. It is easy to criticize but the informed student soon finds that the difficulties are real and that those in charge of our national affairs are doing the very best they can. Would it not be placing an additional burden upon our State and Nation to insist that we now try to make a general change in the methods of medical care which our people have been accustomed to trust for numerous generations?

"There has been concern among some of our people that our country was unprepared for national defense. It may be this criticism is unjustified, but there has never been any doubt about the medical profession's constant preparedness and readiness to fight disease from one day to another, year in and year out, with the most modern scientific knowledge and equipment known to man.

"The American Medical Association at great cost has made available to our Federal Government most invaluable statistical information and records.

"Along with discussions on the war, there has been critical reference to the large number of disabilities uncovered on the physical examination of draftees. Have not many of these been of a preventive nature and does not every town, city, and state have an appointive or elected body charged with the care of the public health and the prevention of disease? The medical profession has learned to conquer and prevent smallpox, diphtheria, and typhoid fever (as examples of many other diseases), and has it not taken years of argument and protest, and the receiving of abuse on the part of the

leading medical men and regular practitioners to get the authorities of government to take the proper steps to eliminate these diseases? Appropriations have been cut and public health agencies hampered so that it has taken decades and generations instead of a few years to effect achievement. (When commerce demanded a cut across the Isthmus of Panama—that was different.) How long has it taken to arrive at the present stage in the control of syphilis and gonorrhea? (Has not the medical profession cooperated to the full in these ventures for the good of the public health?)

"The germ of tuberculosis and its method of transmission has been known since 1882. Tuberculosis is a disease in which the medical profession for years has advocated and agreed to sanatorium and state control. Tuberculosis is a preventable and an expensive disease and now we are talking about being able to eradicate it in another twenty years, some eighty years after the revealing discoveries of Koch. In the February 1st New York State Journal of Medicine, it is stated that the World War is twenty-two years behind us, yet the Federal Government pays in compensation for tuberculosis that originated in service about \$3,000,000 each month at a total cost of some \$959,000,000. In 1939 the total number of World War men compensated for tuberculosis was 55,634, including 1,947 deaths for that year. In the same publication the statement is made that in order to save \$135,000 in x-ray expenses, it is charged that the Government has sent 300,000 National Guardsmen to camp without adequate chest examinations and has thereby assumed a risk of at least \$30,000,000 in future liabilities. It states that service disability claims resulting from tuberculosis among World War veterans have cost the United States about \$10,000 each during the last twenty years. Three thousand cases of tuberculosis among the men now in camp could therefore be expected to cost at least \$30,000,000 during the next twenty years.

"For a long time the medical profession has been in complete accord with the policy of State administration of hospitals for treatment of the insane. Some of our best medical men have been attracted to this work and the annual financial outlay for hospitalization is enormous. And yet we have not solved the problem at all. Is it not a grave question whether we are gaining or losing in our struggle with mental disorder and disease?

"Those of us who have an intimate contact with public health work and who have a regard for high professional attainment most bitterly resent the throttling of the public health by politically minded bodies. Every little health officer in every little town has his mind full of incidents of this nature.

"When the elimination of a costly disease has been brought about, there is a certain amount of justifiable boasting of the dollars and cents that finally is thus saved—but the misery, suffering and loss of life incurred during the years of procrastination and delay—there is little to atone for that.

"We have indicated tuberculosis as an example of a problem for government to try its hand at, along with many other health problems capable of solution, before attempting compulsory health insurance. We do not accept the answer

that the panel class or contract physician in his regular routine of making calls to alleviate symptoms is the one that will discover early tuberculosis. But I do believe that an educated, informed receptive population (public health authority and medical society information)—receiving modern competitive private medical diagnosis and care, with local, state, and Federal aid furnishing adequate policing powers, laborator, sanatorium and hospital facilities, all administered on a progressive scientific basis and unhampered by political manipulation—can be freed from the ravages of a disease we ought to have conquered long ago.

"Much of our public education in health now goes over the radio. Yet Government is still actively concerned in trying to restrict for the public protection some of the statements originating from commercially-minded sources. Would not daily or regular information from an accredited public health source do more to keep people well and thus eventually help business? Is there not too much propaganda directed at the gullibility of the poor sick person? Does the medical profession object to this? They do. Whose duty is it to eliminate these hazards to our welfare?"

"These comments are not made in the sense of criticism but with the idea of pointing out the difficulties in the subject of practical medical care and emphatically with the idea of calling the medical profession and organized medicine to aid in solving these problems.

"The struggle of the human against disease and advancing age is an old, old story—it is destined to be a continuous one—illuminated here and there with brilliant victories.

"It may be that medical expense indemnity insurance, if given proper time and opportunity, will do much for our happiness and welfare. The subject is as yet comparatively new and it deals with important principles and problems. It will take a few years at least to give it a fair trial. The attitude of the State Society has been that it would be most unfortunate to attempt to force it upon communities and organizations not yet prepared for it. At its best, it cannot conquer poverty nor produce abundance. In the meantime, as heretofore, the medical profession will stand by to give every economic strata of our population the best and most modern medical care there is in the world today."

PART VI

Medical Relief

As provided at your last meeting, a Subcommittee of the Council Committee on Public Relations and Economics was set up and charged with the single duty of negotiating an agreement with the State Department of Social Welfare on a plan of medical welfare service embodying the declared policies of this Society. This Subcommittee on Medical Relief (E. Christopher Wood, M.D., White Plains, *Chairman*, Carlton E. Wertz, M.D., Buffalo, F. Leslie Sullivan, M.D., Scotia) was able to start right out on conference work with the representatives of the State Department of Social Welfare. A number of such meetings, in which Dr. Lawrence and Dr. Irving took part, culminated in the following announcement, which was published in the March 15, 1941, issue of the JOURNAL.

Joint Statement

From the New York State Department of Social Welfare and the Medical Society of the State of New York

ON the following pages the outline of "Principles and Discussion" represents the position taken by the State Department of Social Welfare (under the Public Welfare Law) in regard to the various medical welfare policies adopted by the House of Delegates of the Medical Society of the State of New York during the past several years. Also included is an outline of Basic Principles of a New Medical Plan, approved by the State Department of Social Welfare, which is now being put into effect by the State Department in various localities. This is the Medical Plan referred to in the discussion below.

The reader is requested to study thoroughly all this material and preserve these pages for future reference.

For the purpose of maintaining orderly, practical, and logical thinking on the subject of medical welfare policies, the following points must be kept in mind. Under the Public Welfare Law, local welfare officials are empowered to provide medical care on a salary basis or on a fee-for-service basis, consequently the indigent patient may not have or may have the right of free choice of physician according to the procedure adopted in any given locality. In addition, if they are to receive reimbursement from the state, their local welfare departments must be operated under the Rules and Regulations promulgated by the State Department of Social Welfare. At present there is no relation between the Workmen's Compensation panel and the care of indigent patients except in a few localities where such a relation has been mutually agreed upon on a trial basis. Any platform adopted by the State Medical Society, or by local medical groups, has no force whatever in effecting the conduct of medical relief work unless agreement can be reached with the state and local departments of welfare concerning this platform. Such agreements, if reached, are essentially mutual understandings and in no sense abrogate any portion of the Public Welfare Law. It should be noted further that the local welfare official is legally responsible, to his community and to the state, for the entire conduct of his department and he can neither delegate nor share this responsibility. He can seek and accept advice or suggestions concerning medical problems and procedures, but in the final analysis re-

sponsibility for all decisions rests solely on him

In studying the "Principles and Discussion" it will be noted that there is already a considerable amount of agreement on Principles 1, 2, 3, 4, and 7, some of the details of which have to be further worked out from the standpoint of statewide policies. The following portions of the discussion of these principles might well be emphasized. The State Department of Social Welfare agrees that there are advantages in the establishment of a medical advisory committee in each public welfare district and agrees to advocate the use of these committees and to assist in a general determination of their functions. Under the Public Welfare Law, these committees can advise and suggest, and can recommend policies for supervision and administration, but the responsibility for all acts and decisions must remain—and we feel should remain—in the hands of the local welfare official. State reimbursement on a local fee schedule is conditioned upon the State Department's approval of this schedule as being reasonable for the particular community rather than on the basis of a statewide fee schedule. Abolition of the system wherein medical questions are submitted to the State Department for decision is brought about automatically through the introduction of the new medical plan and the "prior authorization" system is transferred to the local agency under local professional control. Considerable study is now being given to the question of medicines and drugs—a few localities having reached a fairly satisfactory solution of this problem—and it can be expected that with local assistance much of the difficulty and criticism will be eventually eliminated. The State Department points out that under the law it cannot guarantee free choice of physician but draws attention to the fact that while in some localities it has been long-standing practice to employ salaried doctors, introduction of the new medical plan has had a tendency to increase consideration of the use of the fee-for-service basis, since provision is made for local medical controls.

Although on the surface there appears to be a wide divergence of opinion concerning Principles 5 and 6, it can be said that the State Department now has a fairly accurate conception of the medical profession's viewpoint regarding these principles. It can be said further that the State Department is not unsympathetic toward these principles but feels that much additional thought and

study are necessary, especially with reference to local conditions, before a common ground can be reached. It is entirely possible that, wherever local medical advisory committees really work and function, salaried practice and the overuse of clinics may be found to be increasingly less desirable medically, socially, and economically. This is not to say that the solution of these problems will be merely a matter of simple evolution but rather to emphasize that their solution directly depends upon the amount of thought and consideration given them.

As enumerated below, there are several methods of providing physicians' services. These methods, their costs, and the results obtained vary with the locality, to a considerable extent dependent upon the judgment and experience of the local welfare official and upon the local conditions and need with which he is confronted. However, nowhere in New York State is there a formal, functioning mechanism which integrates and correlates all the services which are provided in a community at public expense. Only by having the complete picture, especially regarding total individual costs, can the appropriating bodies, the welfare officials, and the medical care professions cooperate to the end that the medical needs of the individual and the community are met efficiently as well as economically.

To provide the services of a physician, one or more of the following methods are commonly used

- 1 Employment of physicians on a fee-for-service basis, either giving the patient free choice of physician or limiting the choice to a selected panel of physicians
- 2 Use of public or private clinics
- 3 Employment of salaried staff physicians to treat patients in their offices and in the patient's home, with specialists' services on a fee-for-service basis
- 4 Employment of salaried staff physicians to treat patients in the patient's home, or in a clinic
- 5 Employment of salaried physicians by a city department of health for services in the home or in clinics, with or without supplementation of this service by employment of general physicians and specialists on a fee-for-service basis when needed
- 6 By any combination of the above methods

Concerning the appointment of a physician

as a medical director or medical consultant and concerning the formation of local medical advisory committees, the State Department of Social Welfare makes the following recommendations to local welfare officials

"The attention of the local public welfare official is called to the value of securing the full cooperation of his county medical society in the development of an approved local medical program and in the selection of a competent physician to act as Medical Director or Medical Consultant on his staff. The State Department recommends that . . . he request the medical society covering his public welfare district to submit a list of physicians recommended by the society as suitable for such appointment and meeting the requirements established by the State Board of Social Welfare, or request the medical society to comment upon the qualifications and professional standing of a licensed physician selected by him as a candidate for appointment as Medical Director or Medical Consultant. Attention is called to the value of an active professional advisory committee in providing the local public welfare official with professional advice in the development and revision of the policies included in the approved local medical program, in the arbitration and discipline of professional problems and the operation of survey boards to review and plan proper medical care for persons suffering from prolonged or disabling illnesses or presenting special or unusual medical needs. The medical advisory committee should be appointed from a list nominated for the purpose by the county medical society. Where deemed advisable this committee may be expanded in the same way to include representatives of other professions, institutions, and laymen."

In conclusion, it should again be emphasized that under the law, the welfare patient is not guaranteed the right to choose his own physician, and the physician is not guaranteed the right to treat his own patient with a commitment of payment for his services. But if the physicians of a given locality can agree among themselves to formulate and to participate seriously in a plan adapted to the medical needs and medical and economic resources of their community, the Public Welfare Law and the regulations of the State Department of Social Welfare make it possible for the indigent patient to choose his own physician and the physician to treat his own patients with payment for his services supplied from public funds. Although the local public

welfare official is responsible for providing necessary medical care for indigent persons, the determination as to the medical needs is now by law "made with the advice of a physician."

JACKSON DAVIS, M D

Chief Medical Officer,
State Department of Social Welfare

CHRISTOPHER WOOD, M D

Chairman,
Subcommittee on Medical Relief
Medical Society of the State of New York

Local Medical Care Plan

BASIC POLICIES

1 Recognition by public officials, physicians, hospital administrators, and all other professional personnel, of the Public Welfare Commissioner's legal responsibility and authority, within existing appropriations, to provide medical care for all persons, under its care, and for such persons otherwise able to maintain themselves, who are unable to secure necessary medical care

2 Acceptance of principle that the local Medical Program of the Department of Public Welfare should be supplementary to, and involve proper, full utilization of all existing medical facilities, federal and state, as well as local tax-supported and voluntary institutions

3 The establishment of a central unit, with administrative responsibility for the authorization and issuance of medical care, and directed by a full-time or part-time physician, who, in the discretion of public welfare official, may be supported by a Medical Advisory Committee, follows recognition of the fact that sound medical program administration requires.

- a Professional medical judgment and controls such as can be given only by a physician.
- b Simplified and smoothly operating procedures to effect the referral of patients to physicians for treatment
- c A clearly defined plan for keeping the social service staff informed of health, medical, and medical social treatment needs of their clients
- d An accounting system

4 Recognition by public welfare officials and physicians, nurses, hospitals, druggists, and other professional personnel participating in the medical care program, of the value and essential need of detailed written agreements wherever practicable, stating clearly the responsibilities to be undertaken by each, as well as procedures and financial payments involved.

5 Acceptance of responsibility to establish and maintain continuous medical records showing

- a Total treatment costs according to type of service, such as physician's treatment, nursing care, drugs, hospital care, appliances, etc
- b Treatment costs of individual patients
- c Diagnostic and treatment records of each individual patient
- d Administrative costs

Without such recording, no sound analysis of the value and cost of the total medical program can be made, nor can the total medical needs of the individual patients be reviewed and adequately or economically met

6 Acceptance of responsibility for joint planning and periodic case conference between the Medical Unit and the Social Service staff for utilization of physicians to determine medical need and social service to determine financial need for those patients applying to the Public Welfare Department for medical care only

7 Acceptance by the Public Welfare Official of responsibility for preparation of written statement of all medical policies and procedures, contracts, price schedules, etc, copies of which should be available to all participating professional personnel or vendors, to the social service staff, and to all cooperating agencies or institutions in any way involved in the local medical program

8 Whenever feasible, the same plan for providing medical care shall be used for all categories of public assistance in order to obviate confusion to the recipient and medical attendant, and to aid in the simplification of administrative and accounting procedures

Principles and Discussion

1 THE MEDICAL ASPECTS OF MEDICAL RELIEF SHOULD BE SUPERVISED BY THE MEDICAL PROFESSION

"Medical aspects" include

Limitation of scope of practice for individual doctors

Decision as to when specialist or consultant is necessary

Decision as to use of special clinics

Evaluation of services in terms of fees and charges

Decision as to whether medical care is needed, or when it should cease

Decision as to drugs and appliances

"Supervision" defined

Above matters should be under effective control of the medical profession by

- 1 Medical society committees
- 2 Full-time medical supervisors, nominated by or approved by medical societies
- 3 County and State medical advisory boards

Actual ruling should be made by local, county or state Welfare Commissioner, but no ruling on a medical question should be made in absence of a definite recommendation by

the medical board or supervising physician.

Discussion

"Medical Aspects"

It was agreed that under the new medical plan the determinations as to limitation of scope of practice and use of special clinics should be made jointly by the local welfare agency and the local professional committee. It was agreed that the other decisions included in "Medical Aspects" would be made by the medical director or consultant of the local agency with or without the advice of a professional committee

"Supervision"

It was agreed that in taking cognizance of the responsibilities of a public welfare commissioner as outlined in the Public Welfare Law, the departmental medical program must be "supervised" by the commissioner and his medical director. A local medical committee should not have any supervisory or administrative responsibility for the program. It was agreed, however, that an "advisory medical committee" should be established in each public welfare district and that this committee should act in an advisory capacity only. It was agreed also that no ruling on a medical question should be made by a local welfare commissioner in the absence of a definite recommendation by the medical director or the medical advisory committee. The State Department of Social Welfare agrees further to advocate the use of these committees, and the exact manner in which they should function will be outlined in a document to be prepared jointly by the Department and the State Medical Society

2 ALL PHYSICIANS SHOULD BE ENCOURAGED TO PARTICIPATE IN THE SERVICE

By abolition of statewide fee schedule and substitution of local schedules, established by mutual consent of local county medical societies and local welfare officers, within limits prescribed by State Department of Social Welfare

By more liberal, but definite, provision for engagement of specialists, and consultants, when needed, in the opinion of the attending physician.

By reduction of red tape and reporting and billing mechanisms to the minimum

By complete elimination of lay interference or dictation in medical matters

Discussion

Under the new medical plan, local fee schedules are prepared by the Welfare Commissioner with the aid and cooperation of his medical director and professional advisory committee. State reimbursement is conditioned upon the State Department's approval of a local fee schedule as being reasonable for a particular community rather than on the basis of a statewide fee schedule

The exact manner and circumstances, in which specialists and consultants are to be engaged, are incorporated as part of the local medical plan

As this plan is developed jointly by the local department, the State Department and the local medical groups, it is to be expected that in each instance this policy can be handled to the satisfaction of all.

Reduction of red tape has already been accomplished through the introduction of a new form which abolishes the former system of a separate bill for each patient and now permits billing on one form for all patients treated in one month.

It was agreed that the State Department's requirement, that a medical director or consultant be engaged wherever the plan is put in operation, would reduce lay interference in "medical determination" to a minimum. It was pointed out, however, that the welfare commissioner is a layman who has sworn responsibilities which he may not renounce—including the authorization of welfare commitments—and that, while it is agreed that in medical matters he should have the advice and guidance of a medical director and/or committee of professional men medically competent, the responsibilities for decision must remain squarely on the shoulders of the commissioner and may in no sense be eliminated or considered as "lay interference."

3. UTMOST DECENTRALIZATION OF CONTROL IN MEDICAL MATTERS

Local supervising physicians or society boards should be able to rule on use of special drugs, use of consultants and specialists or any other special treatment, without reference of these questions to State Department of Social Welfare.

Local welfare officers should have full authority to order special drugs and authorize special modes of therapy, with assurance of reimbursement to themselves, if approved by local supervising physician or society board.

Discussion

Abolition of the system wherein medical questions are submitted to the State Department for decision is brought about automatically through introduction of the medical plan. It was pointed out that wherever the plan is installed and approved by the State Department the "prior authorization" system is transferred to the local agency under local professional control. Under the new system professional members of the State Department staff will periodically examine the records of local agencies to determine whether or not the agency is adhering to the conditions established by themselves in their own plan.

As to drugs the State Department is not as yet ready to change its regulations, especially concerning the use of proprietary drugs. The Department feels that any change in this connection can only be made after a sufficient number of medical plans have been submitted, therein indicating the opinions of the local welfare agencies and local medical groups as to what constitutes a reasonable policy in connection with special drugs and special modes of therapy. It is not likely that this determination can be made for at least another six months.

4. FREE CHOICE OF PHYSICIAN SHOULD BE GUARANTEED SUBJECT TO PROTECTIVE LIMITATIONS

As in Workmen's Compensation practice, panels of participating physicians should be established. Each physician will be bound by the scope of practice for which he has applied, subject to the approval of local authorizing boards.

Any client needing care will go to, or call, his own physician who will care for the patient under the usual conditions of private practice, except that (1) If the patient suffers from a condition outside the physician's scope of practice, he will refer the patient elsewhere, and (2) If the patient fails to qualify for medical aid through the Welfare Office, the physician will continue to treat the patient as a private patient.

Discussion

It was pointed out by the Department that in the majority of communities a system of free choice of physician on a fee-for-service basis is used by the local welfare agency. Wherever this system is used, each of the articles of this principle should be met.

However, the Department pointed out that it has neither the power under the Public Welfare Law, nor does its experience to date indicate the need, to mandate communities to the extent that they *must* use the fee-for-service system rather than salary or contract. It is the major responsibility of the Department to see that the scope of the program provides adequate service, of high quality at reasonable cost to the taxpayers. Wherever the local program fails to meet these requirements, the Department will insist that necessary changes be made regardless of whether the fee or salary basis is used. It is felt that for the Department to *mandate* one way or the other would introduce "State Medicine" to the fullest extent. It was explained that while it has been a long-standing practice in some localities to use salaried doctors, introduction of the new medical plan has had a tendency to swing communities over to the fee-for-service basis.

5. CONTRACT PRACTICE FOR MEDICAL RELIEF SHOULD BE DISAPPROVED

Contract practice is disapproved because

1. From the standpoint of *public policy* it establishes a political control over medical practice.

Establishes a type of service radically different and divorced from the private service available to the general population.

Adulterates the direct legal liability of doctor to patient, the main protection of the individual against incompetence and negligence.

Promotes pauperization of the people by its natural tendency to perpetuate political jobs and extend "free" services.

2. *Medical Policy*

Choice of physician, if properly con-

trolled for protection of patient, has definite therapeutic value

Most competent physicians will not participate in contract plan.

Tendency is to give as little care as possible because of lack of usual incentives

Inevitable overhospitalization under contract plan makes economy an illusion

Cheapens medical service, viewing it as a commodity

Gives free rein to malingerers, and produces growing demand for attention to trivial conditions, at the expense of adequate attention to serious conditions

3 *Ethical Policy*

Directly contrary to and incompatible with the primary ethical principles that have maintained the professional status of the physician, improved the effectiveness of his service, and protected the patient against charlatanism, incompetence, and negligence

Participation by a member of the profession compels him to violate some of these ethical provisions

Discussion

The Department cannot agree to this principle for the reasons stated under Principle No 4. It is quite obvious that if the Department finds the quality of care in a local community effected by and to the extent enumerated in Items 1, 2, and 3, under Principle No 5 and these conditions traceable to the use of salary or contract doctors, the Department would in its normal supervisory role insist upon a change in the system

6 CLINICS SHOULD NOT BE EXPLOITED TO AVOID PAYMENT OF FEES FOR SERVICE THEY SHOULD BE USED WHEN MEDICALLY DESIRABLE

Clinics are largely staffed by private physicians receiving no remuneration for clinic services

When ambulatory cases are sent to hospital clinics for care that could equally well, or better, be given by a private general practitioner in his office,

- (1) The clinic is unnecessarily burdened, cutting down the time available for attention to each case
- (2) The clinic physician is unnecessarily exploited for service to public charges
- (3) The patient is deprived of the right to be attended by his own physician
- (4) The clinic physician or his colleague in the community is deprived of a nominal office fee which would help him pay his taxes

General cases should be sent to general practitioners in the community, especially where the patient expresses preference for a certain physician.

There is no need for a general medical clinic in the relief program

Special clinics should be used wherever a

private physician wishes to refer a patient for diagnostic examination or specialized treatment

The hospital outpatient department should be used as a diagnostic center and treatment auxiliary, by the private physicians, not as a catch-all for every sort of case

Discussion

The program of the State Department of Social Welfare supplements and does not duplicate or substitute for existing facilities. The establishment, expansion, and scope of service of local clinics are determined solely by local government officials. The Department feels that where such services infringe upon or exploit the local medical group, this is a matter for arbitration between local officials and professional groups, and not subject to state interference

With the establishment of the local medical plan, the Department has no choice but to insist that existing clinics and other medical resources be used to the fullest, *reasonable* extent. The department does not, however, insist upon the use of such resources where they fail to meet the purpose for which they were established. In determining jointly with the local welfare agency the extent to which clinics and other resources shall be used, the Department takes into consideration the quality of service, the scope of service, the physical facilities, and the ability of the clinic to handle qualitatively, as well as quantitatively, the number of cases to be referred by the local welfare agency

7 PROVISIONS SHOULD BE MADE TO ENABLE NEEDED MEDICAL CARE TO BE FURNISHED FOR INDIGENT AND NEAR INDIGENT FAMILIES NOT OTHERWISE ELIGIBLE FOR RELIEF

"Medical indigency" should be defined

Discussion

Provision for near indigent families is made through the Public Welfare Law, Section No 85, Responsibility for Providing Medical Care. "The public welfare district shall be responsible for providing necessary medical care for all persons under its care, and for such persons, otherwise able to maintain themselves, who are unable to secure necessary medical care." L 1940, Chapter 682 modified this section by adding, "The determination as to medical care necessary for any person shall be made with the advice of a physician."

It was pointed out that in actual practice and in conformity with this section of the law, local welfare agencies make available to persons not on public assistance such medical care as is required. The medical director and medical advisory committee under the new plan can be of great assistance to the commissioner of public welfare in the interpretation of the medical needs of persons not on public assistance. Under the procedure of the State Department, reimbursement on all such medical care is granted by the department

PART VII

Legislation

The Committee, charged with the duty of study of legislation and putting forth the positions taken by the Society, consists of

John L. Bauer, M.D., *Chairman*

Walter W. Mott, M.D.

Leo F. Simpson, M.D.

Brooklyn

White Plains

Rochester

The Committee has made the following preliminary report up to March 15, 1941. A supplementary report will be ready for the House on April 28, 1941.

"Unquestionably the work of the State and County Legislative Committees is year-round. In order to accomplish the best results, each county committee must be constantly alert, awake to each suggestion on matters which concern medicine, realizing fully that these suggestions create discussions and lead to bills which will need our support or opposition. If we have our ears to the ground, we may be able to advise early and influence the thought of and knowledge on a subject, so that our legislators may be led to appreciate the true significance of that subject. If we take a vacation, just because the legislators are not in session, they will naturally be accumulating facts as they find them and become wrongly impressed with the value of an issue. They are more or less on the job the year round, and while they are not in session, have more time to make up their minds on public questions. On the other hand, when the Legislature is in session, and the bills are being rapidly turned out, it is obviously our duty to contact them frequently, lest the questions are such as they have not considered during the rest of the year—and they have not the time to become informed, as much as they would like to be informed. The legislators have a right to expect us to support them as they are willing to support us—and that means that we should loyally place ourselves at their disposal, so that they may readily know what the arguments for or against a question vital to medicine and public health, should be.

"Therefore, the county medical societies which have active year-round legislative committees are rendering the best service, not only to the cause of their patients but also to the profession.

"The legislator comes to look upon the doctor as his friend—to lean upon him, expecting to be properly informed on public health and other medical matters. The legislator becomes thoroughly acquainted with the value of the Medical Practice Act—is proud of its high rating and will hesitate to tie up with culms which have no scientific substantiation. How could Chiropractic get a foothold, if the legislators knew that no reputable institution of higher learning has ever endorsed the teaching of chiropractic, that the training of the chiropractic graduate is far inferior to that of physicians, that recognition of chiropractic would lower the high standards (even debase them) which govern the practice of medicine, protecting, shielding and benefiting the people, our patients?

"The Workmen's Compensation Law intended to place the workman in a more or less private bed, to keep him out of public hospitals—we recognize that fact and so oppose the McCaffrey bill. We approve the Crews bill—we realize that

the young people who must needs work and go to night school deserve the same privileges of physical examinations that the others receive.

"We all are aware of the political possibilities of the Wagner bill—a provision for compulsory health insurance [compulsory sickness insurance is meant]. We know that no sane man believes that the cost of the operation of this bill can be provided, at least, not at present. We know that it is wrong in principle, it would encourage malingering and neuroses, it would tax severely industry and labor, increasing the cost of living etc. Naturally, we oppose such legislation.

"On request of the Council, we are opposing a bill to give podiatrists authority to treat compensation cases. The Council also instructed that opposition to the Schwert bill should be registered with our Congressmen, a bill which exaggerates the value of development of the muscles—and no thought for the requirement and physical ability of the individual. Wherefore physical examinations! Let the children go to camps. Can you picture all this without proper physical examinations? Can you imagine Federal subsidies without Federal approval of local plans. State Medicine! Dr. Lawrence issued a special bulletin on federal legislative matters and wrote to our Congressmen on the committee to consider this bill, and called upon the county chairmen of the counties represented by these Congressmen, to write similar letters.

"But why continue? The Council, the various legislative committees, are well informed through the bulletins sent out by our Executive Officer and by your own County Committee reports and County Bulletins, of all of the various bills and the actions taken.

"Seven regular, and five special bulletins have been sent out thus far. The mailing list number nearly 600. The return sheet for comment continued to win favor and more returns have been received. Your opinions are invaluable.

"Dr. Lawrence reports 48 Senate and 59 Assembly bills of interest to us so far. To date four have passed both houses. The Chiropractic bills have brought out some interesting information. It is rather controversial, "they did, they didn't." Perhaps one can positively say that the Regents Committee went on record as unanimously disapproving these bills—but they apparently hesitated to declare that in 46 years, scientists have failed to find any scientific value in chiropractic—yet they know positively that such is the truth, and that such a public statement should be forthcoming from them.

"The Annual Conference of County Legislative chairmen and others proved very successful. It was held in Albany on February 14, 1941, the attendance was greater than ever before and the *esprit de corps* was delightful. Thirty-eight county societies were represented. Assemblyman Louis, chairman of the Assembly Public Health Committee and Colonel Gaus, a member of the Adjutant General's staff, were present at the luncheon. Also we welcomed a few ladies, including Mrs. Vander Veer, chairman of the Legislative Committee of the Woman's Auxiliary to the Medical Society of the State of New York. The success of the meeting was really a well-deserved recognition of the services of our Executive Officer, he should feel highly complimented.

It was also an expression of the interest the participants are taking in their legislative work. "Thanks to our officers, Council and Committee Chairmen for timely suggestions and support should now be made. The work must go on with increased vigor."

Malpractice Defense and Insurance

The Committee on Malpractice Defense and Insurance

Clarence G. Bandler, M.D., *Chairman*

Murray M. Gardner, M.D. New York

Andrew Sloan, M.D. Watertown

Peter Irving, M.D., ex-officio Utica

George W. Kosmak, M.D., ex-officio New York

submitted the following report, which the Council approved

"Owing to the fact that this report was filed more than a month earlier than in previous years, due to the annual meeting being held in April, it has not been possible to get as complete an estimate of the cost of operating the Group Malpractice Insurance Plan for the five years ending December 31, 1940, as heretofore. However, the new accounting system, put into effect five years ago, has made it possible to bring all basic data into agreement much faster than under the old system and a preliminary forecast has been obtained from a study of that material. This indicates that there has been no diminution in the number of suits and claims brought against members of the Society and that some increase occurred in the cost of disposing of them. However, this has been partially offset by some reduction in the estimated cost of disposing of the outstanding suits and claims, so it is believed that the net cost of operating the Plan at the end of this accounting period will prove to be substantially the same as at the end of 1939.

"The cost of the minimum or base policy continues to be somewhat in excess of the rate charged and if subsequent experience confirms that cost, recognition of it may have to be made by increasing the base rate. At the time this report was written, however, it did not appear likely that such an increase would have to be made this year. On the other hand, the preliminary estimates indicate that the cost of disposing of suits and claims in excess of \$5,000 has fallen below the income produced by the present schedule of rates for higher limits. High cost suits and claims do not occur with any regularity, nor can their cost be predicted with the same accuracy as those of \$5,000 or less. For that reason, it is never satisfactory or entirely safe to undertake a mathematical prediction of such costs. Nevertheless, the estimates on hand at this time indicate that it may be possible to make some reduction in the schedule of rates for higher limits this year and, if that proves to be the case, new schedules will be published at once.

"As in previous years, it is noted that loose, unwarranted and frequently thoughtless criticism by fellow members of their confreres continues to be the largest single inspiration for malpractice actions. This is a phase of medical practice which can and should be vigorously attacked in every community. It offers the most

effective and perhaps the only way in which unfounded and unjust claims can be discouraged. Medical men are called upon to advise their patients on many matters affecting their welfare. Where that welfare or well-being involves poor results of treatments by other physicians, members should use the greatest care in determining whether those results flowed from negligence or mere errors in judgment or the inevitable complications of life, disease or injury. It is precisely at that moment that the doctor can perform the greatest service to his patient and to practitioners of medicine as a whole by honest and accurate advice to his patient, making sure that he has all of the facts which entered into and affected the previous treatments.

"During the past year, thirty-five suits or claims for malpractice were brought against members who were not insured. In each case, the cost of disposing of those actions, except legal fees and expenses, must be paid for out of the pockets of the individuals concerned. For some, that may not be difficult while with others it may be ruinous. This is a yearly occurrence which can be forecast as to numbers, but as it cannot be predicted as to individuals, it would appear to be poor economy to practice medicine in New York State without insurance when the cost of \$5,000 protection amounts to only \$28 annually. It is recommended that the Council bring this matter to the special attention of all members of the Society.

"Although the number of members who left the Group Plan during the year for various reasons was augmented by members going into military service, the net number of members insured was increased by about 300.

"A word of caution should be sounded for doctors going into the Army and who have arranged with an associate to carry on their practice during their absence and who assume that under such arrangement they would have no malpractice liability to their patients.

"It seems most likely that the doctor left in charge of the practice would be held as the agent of the member whose practice he is taking care of and any action on account of the acts of the agent would probably be brought against both doctors. It is for this reason, and as a factor of security, that it is recommended that any doctor who has been or may be called for military activity retain his Society's malpractice insurance.

"Although Colonel Wanvig, the Society's insurance representative, has been called into active service as the War Department's representative at the national headquarters of Selective Service in Washington, he has kept in almost daily touch with the details of operations of the Group Plan which has been carried forward under the competent care of Mr. Gordon P. Casper and Miss Mary G. Flood who have been associated with the Group Plan since it was organized in 1921.

"The stability of the Yorkshire Indemnity Company as a sound and dependable American company, in no wise affected by the outcome of the war in Europe, has been established to the satisfaction of the Committee and to the Society as a whole. Since this matter has been reported fully to the Society during the year, it is not necessary to repeat it here. During the five years in which the Group Plan has been under

written by the Yorkshire Indemnity Company, the Officers of that Company have a keen understanding and appreciation of the Society's problems and have given their fullest cooperation and assistance at all times "

PART VIII

Medical Preparedness

Immediately following the action of the House of Delegates of the American Medical Association in setting up a national committee, the Council set up a similar committee for New York State. This Committee has functioned since then and consists of the following personnel

Samuel J. Kopetzky, M.D., *Chairman*

Louis H. Bauer, M.D.	New York
Edward T. Wentworth, M.D.	Hempstead
	Rochester

There follows the annual report of this new Committee

"After a conference with the secretaries of the County Societies, held in Albany on July 29, analogous and coordinating County Society committees were established throughout the state, and these committees have functioned very satisfactorily in liaison with the State Committee ever since

"The function of the State Society Committee divided itself naturally into three categories

1. Matters concerned with the Medical Preparedness Committee of the American Medical Association.
2. Matters concerned with the County Societies' committees
3. Assistance to Government agencies

"*Relations with the American Medical Association Medical Preparedness Committee*—All questions involving the development of policy have been referred to the American Medical Association Committee on Medical Preparedness. In most instances, the cooperation has been prompt and sympathetic. The questions which were raised here were also raised in other states. Among these questions, the status of native-born citizens, graduates of foreign medical schools, took up a considerable amount of the correspondence. These men, Americans by birth, graduates of foreign medical schools but licensed to practice here, in some instances were desirous of serving this country in its armed forces, and in other instances were inducted into the armed forces of the country. Their status remains unclarified. The Committee has pointed out that whatever defects their original diplomas had, these deficiencies might be considered as corrected by subsequent internship or residency in a Grade 'A' approved American hospital and has so advised the Army and other authorities who have asked our opinion in the matter. A decision has not yet been made, and the status of these men is still unclarified.

"The question becomes acute when the doctor in this category comes under the provisions of the Selective Service Law and is inducted into the Army. Some of these men have written letters about the condition in which they find themselves, and representations have been made to the military authorities concerned, in an effort to improve their lot, pending decisions from Washington

"Regarding American doctors—graduates of American schools, who come under the provisions of the Selective Service and who are inducted into the Army, under informative letters published by the Selective Service Administration in Washington it has been learned that these men will receive commissions as medical officers. It seems that the amount of time they spend between induction and commission is indefinite and in many instances—in our opinion—too long. Representations have been made to the military authorities, to the American Medical Association committee and to the Surgeon General's office in an effort to clarify this situation

"It has been the announced policy of the Selective Service Administration that medical students, interns and residents who are completing their education, shall receive deferment until the termination of their medical education, with the idea of not interrupting the even flow of educated, qualified doctors into the community. In most instances, in this state, very few complaints have been received regarding the action taken by the local boards in regard to this category of registrant. Nevertheless, since the determination is within the jurisdiction of the local boards, in a few instances these local boards have, to our knowledge, not fulfilled the policy laid down by the National Selective Service Administration. In every instance where that has come to notice, efforts have been made to place the facts before the Appeals Board so that such decisions might be rectified and changes made in accordance with the policy of the Selective Service Administration

"*Relations with the County Society Committees*—Our liaison with the County Societies has been of threefold purpose: first, to facilitate the preparation and completion of the American Medical Association questionnaire, urging doctors to forward them to the American Medical Association headquarters; second, to procure the completion of the State Society questionnaires and send duplicates to the State Society headquarters properly annotated by the County Society officers; and third, to provide the personnel to man the local board examining posts, and the personnel of the Medical Advisory Boards of the New York State Selective Service administrations—that for the New York City area, and the one for the rest of the state

"In every instance, it is a pleasure to report that fine cooperation has been established between the County Society committees and our own. Rapid and prompt responses have been received either by telephone, or sometimes by telegraph. The Society has had commendations from the New York State officials upon this activity. We have asked the County Society Medical Preparedness Committees to develop the home defense activities within their counties and assume the initiative in them, and this work is progressing

"*Liaison with Government Agencies*—The military authorities of the Second Corps Area and the Second Military Area have been in constant communication with the Medical Society of the State of New York in regard to personnel. Reserve Officers who have been called to duty and whose departure would leave their communities uncovered have brought their individual situations to our attention. These matters were taken

up with the military authorities, and in most instances the man was relieved of duty and returned to his civilian work

"The qualification of medical men to serve on induction boards has also been carried out with the assistance of our New York office. In every instance, the recommendations have come from the County Societies and have been checked by us and forwarded to the military authorities. We have had no information as to who has been appointed, or how many. We forward the information and the Army does the rest

"Regarding the commissioning of physicians—information came some time ago that the Army would not commission men except after induction under the Selective Service law. On the other hand, the Navy is commissioning officers in the medical corps without having them go through this process

"The Committee wishes to state that it cannot but feel a source of great pride in the fine contribution that some thousands of men of our profession are making toward the national defense program. Of course, there have been misunderstandings, and there have been some complaints—but on the whole the service rendered by the profession has been well received and is fully appreciated

"In liaison with Government agencies, this Committee took an active part in the meetings of the Commission to formulate a Long Range Health Program of the State of New York. We have met with them at each meeting held, and are making our contribution toward their activity

"*General Remarks*—The provisions by the County Societies for taking care of the practice of men who are absent from their private practice because of military service is causing us considerable concern. We have urged, at various meetings, that the principle embodied in the Bauer Plan be made the basis upon which the County Society take action. It is our considered opinion that no plan can be devised which would be totally satisfactory. It is a matter of honor between the absentee and the man who substitutes for him. We have had a decision from the Internal Revenue Department on the matter of taxes so that the income from the absentees will not be taxed twice

"It has been our aim that the refugee physicians licensed to practice in this state, and the foreign graduates licensed to practice in the state, be treated on a basis of equality with the American doctor before the law—in regard to commissions, and in regard to military service. Otherwise it would be an injustice to our native graduates of American colleges, as they would be called to duty and their practice would be left to the refugee physician and the graduates of foreign medical schools. Manifestly, this is an injustice to the patriotic native American graduate of an American school. We hope that the authorities in charge of our naval and military forces will see the force of the argument advanced to them and will treat these adopted citizens, and also the graduates of foreign schools, on terms of equality with our own graduates who are native-born citizens. This should be done so that the regulations will not work out prac-

tically to the detriment of the native-born American and the graduate of an American school—putting upon him the hardship of military service while his confreres from abroad and the graduates of foreign medical schools take his practice while he is away. It may not be military policy to put foreigners in key positions, but the diversity of Army medical work is such that a place could be found for them, and they should be treated on a footing of equality, as far as military service is concerned

"In these trying times, it is hazardous to be prophetic, and while we have reason to suspect that certain basic changes will take place in regard to industry which may require medical service, at the present time this is not a pressing factor for consideration and we prefer to leave this bridge uncrossed until we have approached it

"In conclusion this Committee wishes to express its sincere thanks for his cordial and ever willing cooperation to the General Manager of the Society, Dr. Peter Irving, and to the staff of capable workers who have assisted the Committee in its necessary work, which has entailed daily contacts and daily attention "

PART IX

Workmen's Compensation

The Council through its Committee on Workmen's Compensation has continued during the past year to maintain an active interest in all phases of the Workmen's Compensation Law affecting medical practice in this state.

Nearly 19,000 physicians have been qualified by the various county society compensation committees or boards, and the majority of them are actually participating in the treatment of injured workmen. This makes available to the working men and women of this state a large reservoir of well-qualified physicians and specialists. The major activities of the Compensation Committee of the State Society have been directed to aiding the county medical societies in carrying out the functions that devolve upon their compensation committees under the Workmen's Compensation Law, such as (1) the qualification and recommendation of physicians to be placed upon the panel, (2) the setting up of standards in the various specialties to aid the committees in the task of qualifying applicants, as well as to help in any change of rating to which a physician would become entitled as a result of increased experience or embarkation in a specialty, (3) guidance to simplify and coordinate the administration and practice of the various county society boards in relation to the above procedures in the interpretation of the rules and regulations governing the Workmen's Compensation Law and of items in the fee schedule for medical service

Through the Bureau of Workmen's Compensation contact is made with more than seventy individual carriers, with the Compensation Insurance Rating Board, and with self-insured employers. Contact is also made with non-insured employers in relation to compensation problems and medical bills and with all the above in connection with the many phases of workmen's compensation practice affecting the medical profession and hospitals. Uniform prac-

tice and administration have been aided by the Bureau through its relationship with the Industrial Council, the Industrial Board, and the Industrial Commissioner.

The following totals indicate the number of physicians qualified in each county (excluding homeopaths and osteopaths) Albany, 284, Allegany, 41, Bronx, 1,976, Broome, 204, Cattaraugus, 80, Cayuga, 67, Chautauqua, 106, Chemung, 99, Chenango, 41, Clinton, 47, Columbia, 40, Cortland, 42, Delaware, 51, Dutchess, 146, Erie, 942, Essex, 33, Franklin, 64, Fulton, 66, Genesee, 53, Greene, 41, Herkimer, 57, Jefferson, 103, Kings, 3,457, Lewis, 23, Livingston, 53, Madison, 37, Monroe, 503, Montgomery, 61, New York, 4,797, Nassau, 490, Niagara, 164, Oneida, 230, Onondaga, 394, Ontario, 97, Orange, 149, Orleans, 26, Oswego, 72, Otsego, 63, Putnam, 15, Queens, 1,175, Rensselaer, 128, Richmond, 121, Rockland, 85, Saratoga, 67, Schenectady, 114, Schoharie, 29, Schuyler, 11, Seneca, 26, Steuben, 86, Suffolk, 186, Sullivan, 69, St Lawrence, 86, Tioga, 37, Tompkins, 67, Ulster, 108, Warren, 56, Washington, 48, Wayne, 64, Westchester, 726, Wyoming, 40, and Yates, 27.

A total of 18,574 licensed physicians were qualified by the various county society boards up to February 1, 1941. In addition, a total of 292 physicians have been qualified by the Homeopathic Society and a total of 360 by the Osteopathic Society, making a grand total of 19,226 physicians qualified and authorized for workmen's compensation in the state to date.

Arbitrations—During 1940, sixty-four arbitration meetings were held, fifty-eight in the metropolitan area and six in upstate areas.

Bills amounting to \$93,253 14 were considered (metropolitan \$84,927 79 upstate \$8,325 35), of which \$83,792 25 was in dispute (metropolitan area \$76,993 90, upstate \$6,798 35), awards were made totaling \$49,083 19 (metropolitan area \$45,487 84, upstate area \$3,595 35).

The above represented 1,155 physicians' bills, awards were made in 1,047 and no awards in 102 instances. Four hundred and twenty-one were settled before arbitration for bills amounting to \$28,192.97, in which the amount in dispute was \$24,957.37.

Upstate Arbitrations—In the report last year the Committee went into great detail on the question of arbitration, and it is suggested that physicians would greatly benefit by reading this report again. Upstate arbitrations have not been numerous, indicating that most physicians throughout the state are receiving satisfactory payment for their services. It is hoped that the infrequency of arbitrations does not indicate that physicians are settling bills and allowing deductions where the latter are not indicated. A just and proper bill should be paid in full, subject only to the 5 per cent discount for payment within thirty days of the submission of the bill. Such discount should not be permitted on bills under \$15 and deductions should under no circumstance be permitted merely to avoid arbitration, inconvenient though that may be at times. The threat of arbitration should not deter a physician from insisting on payment in full of a just bill. However infrequent instances of this form of coercion may be, they should be

brought to the attention of the Director at once. Insurance carriers and self-insurers organizations have assured your Committee that they are not in sympathy with this procedure and will correct any instance of improper pressure being brought to bear on a physician to take a cut in a just bill.

It should be pointed out that as insurance carriers' representatives and physicians become more familiar with the interpretation of the rules and regulations governing medical care and the interpretation of the fee schedule there has been a great tendency to pay physicians' bills as rendered without the necessity of arbitration, relieving the arbitration calendar of many bills that represent only minor misunderstandings or misinterpretations of the fees to be paid under the statute, thus reserving arbitration for the more fundamental controversial issues, such as the claim of failure on the part of the physician to comply with the law in regard to prompt reporting of compensation cases, the necessity for prolonged treatments, the need for consultation, the failure to obtain authorization for physical therapy treatments in excess of \$25, the failure of physicians to contact the previous attending physician before ordering x-rays, laboratory service, and additional consultation, claims for fees in excess of the fee schedule not authorized in advance, and many of other principal objections to a physician's bill. Compared with the hundreds of thousands of bills submitted each year totaling about \$16,000,000, an insignificant number are forced to arbitration.

Arbitrations—Statistics—During the year 1939, 129 different bills of physicians in Bronx County were arbitrated. The total amount represented \$11,368 27. Of this amount \$10,540 82 was in dispute and was arbitrated. Awards totaling \$6,307 75 were made. Of 129 different bills the full amount of the bill was awarded by the arbitrators in twenty-five arbitrations. No awards were made in six of the 129 bills. In five of these six cases in which no award was made, this represented the total bill, while in the remaining bill something had been paid on the bill and no award was made on the balance.

In New York County during the same year, 258 bills were arbitrated, representing twice the number of bills arbitrated for Bronx County physicians. The total amount of bill was \$25,866 50, of which \$22,773 05 was in dispute and awards totaling \$12,994 75 were made. In fifty-one bills out of 258 the full amount was awarded while in thirty-two bills nothing was awarded. In twenty-three of these thirty-two bills the entire amount of the bill was in dispute, while in nine cases something had been paid on the bill.

Taking into consideration that entirely different arbitrators sat for Bronx and New York counties during the course of the year and that the arbitrators were changed from time to time, there is a close analogy between the figures here given. Out of 129 bills twenty-five were paid in full in the Bronx. Out of double that number of bills, or 258 bills, fifty-one were paid in full in New York.

The total amount of the awards in Bronx County was \$6,307 75, while in New York County, with twice the number of bills and a

little more than twice the amount in dispute, almost twice the amount was awarded—namely, \$12,994.75

In the nine counties studied—Bronx, Kings, Queens, New York, Nassau, Richmond, Rockland, Suffolk, and Westchester—677 bills were arbitrated, and the total amount of these bills represented \$69,031.52. The total amount in dispute was \$61,068.62, and awards totaling \$32,228.05 were made.

Out of 667 bills for this area, 100 were paid in full and no awards were made in seventy-nine bills. In sixty-one bills the arbitration was on the entire amount of the bill, while in eighteen of the seventy-nine something had been paid on the bill.

In considering the percentages, it is to be noted that in all bills where the percentage of deduction made by the arbitrators represented the total amount in dispute in both Kings and New York counties 43 per cent of the total amount was awarded in each of these counties. The same figures held true of Suffolk County.

Taking into consideration only those bills where deduction was made and not including bills awarded in full, the figures for Bronx are 44 per cent, New York 43 per cent, Rockland 42 per cent, and Suffolk 44 per cent. Higher amounts were deducted in Kings County (55 per cent), Queens County (52 per cent), Richmond County (fewer bills, 72 per cent), and Nassau County (55 per cent).

Arbitration—Hospital Bills—Under Section 13-g-2 is included the *modus operandi* of arbitration for hospital bills. For the past two years hospital bills have been arbitrated not under the provisions of this chapter but by a special arbitration committee set up by the Compensation Insurance Rating Board and the hospital organizations of this state. It is urged that Section 13-g-2 be modified to remove the necessity of the medical societies arbitrating hospital bills.*

Payment of Bills Not Objected to—Under Section 13-g there is a provision that gives the employer or insurance carrier thirty days after the receipt of a physician's bill in which to demand an impartial examination of the fairness of the bill by arbitration. Otherwise the amount claimed by the physician is deemed to be the fair value of his services. However, there is no provision to enforce the payment of such bill should the employer or carrier refuse to pay it without civil action. Civil action, in our opinion, would unquestionably bring a verdict for the physician in such an event. It is our opinion that there should be a revision of this subsection 13-g to include a sentence to enforce such payment without the necessity of court action. A revision of the statute to bring this about is strongly recommended.

Reports Required Under Section 13-a(4)—Un-

* During the year 1939 nearly 500,000 compensation accidents were reported. Owing to increased employment in 1941 will see a larger number of such accidents.

In about 133,000 of these files were indexed and hearings held.

In the remaining 370,000 cases no files were made or hearing held.

We must take up the slack between the indexed cases and the nonindexed cases in order to assure payment to physicians for medical care in all compensable cases.

der the provisions of Section 13-a(4) a claim for medical and surgical treatment is not valid and enforceable until the physician has made out the necessary reports (C-104, C-4, C-14, etc.) as required by this Section. The Industrial Board may, however, excuse failure to give such notice if it finds it in the interest of justice to do so. Few insurance carriers or employers have taken advantage of this Section unless their interests were seriously prejudiced by the failure of the doctor to report a compensation case. Six years have elapsed since the passage of the amended Workmen's Compensation Law, and it is not to be expected that the insurance carriers will continue to be so lenient where a physician deliberately avoids his obligations under this Section. The Department of Labor has drawn attention to the failure of certain physicians to comply with the law, thereby prejudicing a workman's claim for compensation as well as the physician's own interest. While it is true there has been a marked improvement in reporting, it is recommended that county societies continue to emphasize the importance of this to their members.

Workmen's Compensation Law—Section 13-a(5)—Under Section 13-a(5) no claim for specialists consultation, surgical operations, or physical therapeutic procedures costing more than \$25 or x-ray or laboratory examinations costing more than \$10 shall be valid and enforceable unless the services have been authorized by the employer, insurance carrier, or industrial commissioner, or unless such authorization shall have been unreasonably withheld, or unless the services are required in an emergency. Under a strict interpretation of this statute, a carrier or employer might well refuse to pay a physician's bill unless he could prove that he had received such authorization in a nonemergent case or unless he could prove by documentary evidence that he had made a written request of the employer or carrier and that such request had been ignored for at least five working days. Even then the question of necessity for consultation might be raised. Although the industrial commissioner has the authority under the law to authorize treatment, such authority has never been forthcoming nor has any means of reviewing promptly the medical aspects of the case in order to obtain a prompt decision on the question of necessity for the procedure costing more than \$25 been set up within the Labor Department, therefore, some thought must be given to a mechanism whereby disputes with regard to the payment of a bill because of alleged failure of a physician to obtain authorization should be considered.

The Committee is of the opinion that a clause should be added to this Section to enable a physician whose bill has been objected to have his claim reviewed by an arbitration board as in Section 13-g. This would require an amendment to Section 13-g(2) to the effect that, if a physician renders a bill for services in excess of \$25 under section 13-a(5) and if the carrier objects to such bill within thirty days, the same shall be arbitrable. Such an amendment to the law would broaden the scope of the arbitration committee to include numerous disputes that arise under this Section. At the present time carriers frequently submit to arbitration volun-

REPORT OF THE COUNCIL

731

tarly on this issue. It should be made obligatory. Your Committee is of the opinion further that the Department of Labor should give consideration to the provisions of Section 13-a(5) which authorize the Industrial Commissioner to give authorization for operations, consultations, physical therapeutic procedures costing more than \$25, and x-rays and laboratory procedures costing more than \$10. This would certainly rebound to the advantage of the injured workmen and avoid the occasional charge that physicians are failing to give medical care where such authorization is refused by the carrier.

The Council wishes to advise physicians throughout the state that, while every possible advantage should accrue to an injured workman with regard to specialistic treatment and consultation, the attending physician should use his best judgment in old and protracted cases with regard to the necessity of consultation. A specialist receiving a patient from a physician with request for consultation or for x-rays or laboratory examination should give attention to the need for authorization and should be on his guard in old and protracted cases to ascertain whether the desired consultation is necessary and whether frequent consultations have not already been held. Where such consultations and examinations are desired for evidential purposes before the Department of Labor and are instigated by an attorney or claim representative through the intervention of the treating physician, the specialist should be on his guard and confer with the previous attending physician on the past history of the case and procedures already carried out in order to determine the need for the consultation, even though it be not in excess of \$25. Attention is again called to the rules governing the procedure to be followed by physicians when the carrier objects to further treatment.

In the February 1, 1941, issue of the NEW YORK STATE JOURNAL OF MEDICINE, there appeared an item under the heading Workmen's Compensation which was designed to familiarize physicians with the various forms that are required to be filled out and the changes made in the law effective July 1, 1940. There was a reprinting of this same item in the February 15 issue with a few corrections.

"We have been informed by the Director of Workmen's Compensation of the Department of Labor that many physicians throughout the state are not yet familiar with the amendments to the Workmen's Compensation Law which became effective on July 1, 1940. These were published in the NEW YORK STATE JOURNAL OF MEDICINE, June 1, 1940. The attention of physicians practicing under the Workmen's Compensation Law is again directed to these amendments, and they are urged to comply with them.

"It should be noted that the C-4 report must now be forwarded to the employer or insurance carrier and the Department of Labor, within fifteen days instead of twenty days as heretofore. This report should be notarized, but physicians are urged not to delay it if a notary is not available. The C-104 form is reportable within forty-eight hours. The new progress report (C-14) should be sent to the employer or insurance carrier and

the Department of Labor in all protracted cases every three weeks. The Law states that the C-14 report should be submitted when requested, by the employer or insurance carrier, but it is advisable to submit such reports, even though not requested, at regular intervals, in order to familiarize the employer or insurance carrier with the progress of the patient if the medical care continues beyond the first four weeks or so.

"Another amendment, effective July 1, 1940, gives to the Industrial Board the right to assess the cost of medical care against a non-insured employer. Physicians treating claimants whose employers fail to carry insurance should submit bills for medical service directly to the Department of Labor, care of the Industrial Board, 80 Centre Street, New York City, and send a copy of the correspondence and bill to this office.

"Workmen's compensation committees or boards throughout the state are urged to bring the above changes to the attention of physicians at the regular meetings of the county societies and by publications in local bulletins.

"The various forms (C-104, C-4, C-5, C-14, C-27) are available on application to the local county society office. Forms are obtainable by the societies upon application to the Department of Labor, Albany and New York offices. Physicians should not apply directly to the Department of Labor for blank forms."

The following is a brief summary of the order in which reports must be filled out and filed by the physician. On assuming the treatment of a case under the Workmen's Compensation Law a physician should immediately file a C-104 report with the Labor Department and either the insurance carrier or employer. This report should not be neglected, as the law requires that the form C-104 be sent within forty-eight hours of the first treatment of the patient. If the name of the insurance carrier cannot be ascertained immediately, the form should be sent to the employer with specific directions that it be sent by him to the carrier at once. Within fifteen days a second report must be filed in each case. This is the C-4 report. It also must be sent to the Department of Labor and the insurance carrier or the employer. This report should be notarized. It will, in most cases, save the physician the inconvenience of appearing at the Department of Labor for testimony. It serves as prima-facie evidence. However, if a notary is not readily available, the C-4 should not be delayed beyond the fifteen days and may be sent unnotarized.

The ophthalmologist reporting on eye cases, instead of the C-4 report, submits an ophthalmologic or C-5 report.

The C-14 report is known as the progress report and under the law need be filed only at the request of the employer or carrier and not oftener than every three weeks.

It is suggested, however, that all physicians file the C-14 report in all protracted cases at regular intervals, say every three to four weeks, so as to keep the carrier informed as to the progress of the case, the need for further treatment, etc. This will avoid misunderstanding over bills. The C-14 report may be used as a means

of requesting authorization for continued physical therapy beyond the \$25 fee and, if so used, should bear a notation requesting authorization for the continuation of treatment. The body of the report will indicate the necessity for such treatment to the employer and carrier and the Department of Labor. If a patient comes but once or twice and the case can be terminated within a few days, the physician may file only a C-4 notarized report and mark it *final* to indicate that treatment has been terminated. In such short cases this form will simplify matters and make it unnecessary to file both C-104 and C-4 reports.

If a patient returns to a physician after his case has been closed by the Department of Labor and if in the physician's opinion there are sufficient medical reasons to reopen the case and have another hearing by the Department of Labor, the physician should use the C-27 report instead of the C-4 report to reopen the case. A copy of this should be notarized and sent to the Department of Labor and to the insurance carrier or employer.

Specialists or consultants should always send a full report of the examination on their own letterhead to the Department of Labor and insurance carrier or employer. A copy should also be sent to the referring physician. A specialist or consultant need not file other reports unless he assumes treatment of the case, in which event he carries out the same procedure as though the patient had come to him for treatment. It is the responsibility of a physician authorized to treat compensation cases to go carefully into the history of every patient who comes to him for treatment to ascertain whether or not the injury was sustained in the course of the patient's work. In the vast majority of cases the circumstances of the injury will indicate whether or not the case is a compensable claim. In some instances, despite scrupulous care in taking a history, it will not be immediately apparent to the physician that the case is covered by the Workmen's Compensation Law. He will treat the patient and may be paid by the employee. However, if the patient makes a claim subsequently, the physician will be required to file the necessary forms. Even though he is of the opinion that the injury sustained for which he treated the patient is not covered by the law, he must make out the forms so that the labor department, which has jurisdiction, may determine the question of compensability. The physician may indicate in his report, or in a separate letter in a case which he believes not to be compensable, his reasons for treating the patient as a private patient, and he may give such other information as may substantiate his opinion relating to the question of compensability. Should the case be declared compensable, the physician will be required to reimburse the claimant and look to the employer or carrier for the payment of his bill. There are many reasons why, under such circumstances, a bill may be well in excess of the minimum. There are usually adequate reasons why the physician should be excused by the Industrial Board for failure to file his reports on time if the employer or carrier raise this issue. Should complications of this sort arise in the practice of a physician, they may be brought to the attention of this

Bureau for such help as it may be able to give.

Rule No. 7—A meeting was held recently by the Industrial Council at the suggestion of the insurance carriers organization to discuss a change of Rule 7 (of the fee schedule) which gives the employers or insurance carrier five working days in which to respond to a request for authorization under Section 13-a(5).

"When it is necessary for the attending physician to engage the services of a specialist, consultant or a surgeon, or to provide for physiotherapeutic procedures, costing more than \$25, or to provide for x-ray examinations, or special diagnostic laboratory tests costing more than \$10, he must secure authorization from the employer or insurance carrier or the Industrial Commissioner."

E.g., when the total fees for physiotherapeutic treatment approach the sum of \$25 the physician shall file an additional report and request authorization as prescribed in Section 13-a-5.

"This Rule also applies to hospitals, specialists, consultants, and surgeons who are actually engaged to perform such services."

"If telephone request for such authorization is made, it should be confirmed by letter. If such authorization is not forthcoming or is not denied within five working days, or if such denial is not justified medically or otherwise, the special services required for the patient's welfare should be proceeded with on the ground that authorization has been unreasonably withheld."

"Such authorization is not required in an emergency under the provisions of Section 13-a-5."

It was pointed out by the carriers that in extremely old cases it is not always possible either to affirm or deny authorization within this period. Their plea was for an extension of this period in such cases. The Director of the Workmen's Compensation Bureau of the State Society contended that there was no need for revision of this rule, which has been in effect for more than two years and has worked satisfactorily. The Industrial Council has as yet made no change in the rule. It is strongly recommended that there be no change in the rule as it would often inure to the disadvantage of injured workmen should authorization be delayed beyond this period.

Rules for "Further Treatment"—During the past year there was a protest by the insurance carriers on the rules promulgated by the Industrial Council. As a result of additional conferences with the representatives of the insurance carriers and self-insurers organization, the Medical Society, and the Industrial Council, the following rules were promulgated and are now in force and to be observed by all insurance carriers, employers, and physicians. Instances of refusal or failure of an employer or carrier to comply with these rules should promptly be reported to the Director.

Procedure for adjusting differences of opinion between attending physicians and the examining physicians employed by carriers and employers as to the need for further treatment—Rule 1. The employer or insurance carrier must exercise their right to have a medical examination

made of a compensation claimant by their medical examiner, on which a direction to the attending physician to stop treatment must be based. Rule 2 A request forwarded to the attending physician to stop treatment must be accompanied by a report of the medical examiner employed by the employer or insurance carrier setting forth the physical findings. Rule 3 If the attending physician does not agree with the findings of the medical examiner, he must arrange to confer with the medical examiner for the purpose of reaching an understanding. Rule 4 If the attending physician and the medical examiner are unable to agree, a joint examination of the claimant should be arranged for the purpose of comparing the findings of both the attending physician and the medical examiner.

"Rule 4 is not mandatory although the representatives of the carriers and employers agreed that this procedure should be used whenever possible."

Physicians will conserve their interests by filing a progress report every three or four weeks in a protracted case. If physical therapeutic treatment is given, when the total amount aggregates close to \$25 the progress report may be used as a means of recording the necessity of further treatment and requesting authorization for same. If the employer or carrier then does not comply or answer within a reasonable period, say a week, it may be taken for granted that the carrier has unduly and unreasonably withheld authorization, and, if further treatment is necessary, the physician will of course continue. Should the carrier or employer comply with the rule and submit to the attending physician a medical report indicating that no further treatment is necessary, the physician should confer with the physician making the examination for the employer or carrier and, if no agreement can be reached, suggest the appointment of an impartial examiner agreeable to both sides. If the carrier or employer refuses such consultation, the case should be referred to the labor department for a prompt hearing and examination on the question of the need of treatment. During the interval the physician will be guided as to treatment by the needs of the patient. In every such case the attending physician should either attend the hearing and be present at the medical examination or give to the employee a note indicating the medical facts in the case so that examiner may be conversant with all the details of the dispute. Unless a medical examiner makes a definite statement in regard to treatment, the fact that he states there is "partial disability" or "some earning capacity" is not itself a direct mandate to proceed with treatment nor a denial of the necessity of treatment. Medical examiners will not, and should not, take a position with regard to medical treatment. Where the case is a controverted one, the medical examiner of the Department of Labor may recommend the appointment of an impartial expert (especially qualified physician) to examine the patient and make a report before making a statement in regard to the controverted issue or on the necessity for further treatment. In every case where there has been a lack of agreement between the attending physician and the carrier (employers

medical representative) as to the necessity for further treatment, it is recommended that at least two examiners of the department examine the patient, after reviewing the file carefully, before making a pronouncement on the need for and advisability of further treatment. In controverted cases where the question of causal relationship is involved, it would seem that the patient's physician or consultant should more often be called to testify than is the practice at present. This is strongly urged.

Qualification of Physicians—It has been the purpose of the Council Committee to standardize the procedure of qualifying physicians (by the County Society Compensation Committees or Boards), giving due consideration to the varying standards of practice throughout the state. During the past decade there has been a gradual approximation to the standards of the large cities by physicians in the smaller communities and rural areas of this state. While the number of specialists available in rural areas is not generally as great, the qualifications of such specialists are, generally speaking, similar to those in the large cities. For economic reasons it is often impossible for a well-qualified specialist to confine himself strictly to his specialty, especially in the rural areas. While the national boards have shown a tendency to demand stricter adherence to specialization for physicians throughout the state, there is still reason to believe that well-qualified physicians may, for economic reasons, not be able to adhere completely to their specialties. The Committee has set up standards for qualifications in the various specialties which have been distributed to each county society and serve as a guide to the compensation committees. While these standards are not mandatory, they have generally speaking been accepted with minor modifications to conform to the pattern of practice in the particular community. It is not possible in the small county societies to set up special advisory qualifying committees in each specialty. This has been done in some of the large counties. The Committee strongly advises that, whenever possible, such committees be set up to serve in an advisory capacity to the workmen's compensation committee or board. In the smaller counties it would be advisable, so far as possible, to place on the compensation committee itself specialists, as well as general practitioners, to pass upon the qualifications of applicants for original rating or rerating.

Occasionally, there arises some difficulty in interpreting the symbol "X," which ordinarily indicates that a physician is in general practice or not confining himself exclusively to a branch of medicine in which he is especially qualified. The symbol, "X" when it precedes a specialty rating (such as XA, XE, etc.), may indicate either that the physician is not confining himself exclusively to his specialty or that he has not yet been deemed fully qualified to act as a consultant and to accept referred work in a large city or in the metropolitan area. It is generally accepted in rural areas and smaller communities throughout the state that a physician with an "X" rating followed by the symbol of a specialty is competent and qualified to act as a specialist if he in fact is known to so act in private practice. In larger communities, however, there has been a tendency to confine referred work or con-

sultation to physicians who are fully qualified and who have an "S" rating. The reason for this is not only the competence of the physician in technical work but also his judgment, knowledge, and experience, which can only be acquired over a period of years. This is especially significant in regard to expert testimony before a referee or the Industrial Board. There is ample reason, precedent, and authority to restrict consultation and referred work to the best qualified men in the profession. Difficulty arises, however, when a more or less simple operative procedure is referred to a younger specialist who has been deemed qualified in the specialty but not fully qualified by reason of lack of years of experience to obtain the full "S" rating. Such physician possesses usually an "X" rating either in surgery (XA), orthopedic surgery (XB), or in one of the other specialties. In instances of this sort the "X" rating indicates not necessarily that the young specialist is engaged in general practice but may merely be a temporary partial rating until he has fully complied with all the standards set up by the qualifying committees to enable him to obtain the "S" rating. A satisfactory arrangement has been made in the metropolitan area with many of the insurance carriers whereby, when a physician with an "XA," "XB," etc., rating operates on or accepts a case from another physician, the county society compensation chairman is called upon for an opinion as to the physician's qualifications to cope with the particular situation. This has worked out satisfactorily and has served to obviate many difficult situations in which the carrier objects to such physician's bill because he accepted a referred case. The interests of the workman are protected because the county society is able to determine quickly whether, in accordance with the qualifications on file, the particular physician is indeed qualified to cope with the situation or was so at the time he accepted the referred case. Therefore, it should be noted that, especially in the case of younger specialists, the "X" rating may denote simply that the physician, although qualified, is not deemed fully qualified to act in all cases as a consultant or to accept referred work as such. In due course such younger specialists, on acquiring added experience, obtain the full "S" rating.

Multiple Symbols—County societies are again urged, if they have not already done so, to simplify the symbols given to practitioners under the Workmen's Compensation Law in accordance with instructions published by the Council in its report of 1940 in the JOURNAL of April 15, 1940, and approved by last year's House of Delegates.

In the field of x-rays, county societies are urged to use the services of the X-Ray Examining Committee set up by the Committee with the approval of the Council before granting "D" ratings.

Appeals over Decisions of Compensation Boards—In the course of the past year a few appeals were taken over the decisions of compensation boards with regard to qualifications, and in each instance the action of the county society has been sustained by the Industrial Council. It is recommended that before any compensation board or committee refuses to qualify a physician he be given a *personal* hear-

ing before the board or committee and that, in case of rejection either of an original application or request for revision of rating, minutes of the committee or board be recorded and a copy sent to the Director of the Bureau of Workmen's Compensation, Department of Labor.

In each instance the Director has personally appeared before the Industrial Council to assist the representative of the county medical society in presenting its case.

Employers' Medical Bureaus—Where county societies have recommended the granting of an employers' medical bureau license to the Department of Labor, it is now recommended that the county society compensation committee or board keep in contact with such bureau and ascertain whether the bureau is maintaining proper equipment and complying fully with the provisions of the law, especially in regard to the reporting of cases. Physicians employed by such bureaus are not exempted from the provisions of the law in regard to the reporting of all cases to the Department of Labor which require treatment beyond the first day.

Complaints have been made that physicians employed by employers' medical bureaus and occasionally, independent physicians are rendering medical care at the behest of employers without reporting minor injuries to the Department of Labor and that some fail to make "full and truthful" reports in regard to the patient's disability. This is a practice that cannot be too strongly condemned, as it may seriously jeopardize the rights of the injured worker. If such practice can be proved, there is ample authority in the law to remove the offending physicians from the panel.

The labor department has under consideration the revising of the rules governing employers' medical bureaus in order to make for better accommodations for patients in such bureaus set up temporarily in the course of construction of buildings, plants, or public projects. The committee strongly recommends that these revisions of the rules be made as soon as possible in order to improve the quality of medical care rendered to workmen on such projects.

First-Aid Stations—It is again recommended that rules and regulations be set up by the Department of Labor to cover first-aid bureaus.

Self-Insurers—During the past year there has been an improvement in the promptness with which self-insurers have given attention to bills for medical services. The Bureau is now in a position to make immediate contact with officials of the self-insurers organization in respect to complaints received from physicians affecting self-insurers.

Bureau's Aid in Settling Bills—The Bureau has continued to be available to the various county societies in the settlement of bills or other disputes between physicians, carriers, or employers and, through its contacts with the insurance carriers' organization, self-insurers' organization, the Department of Labor, the Industrial Council, and the Industrial Board, and with individual insurance carriers, has been able to iron out successfully the majority of the matters brought to its attention to the mutual satisfaction, it is hoped, of all parties in interest. The Bureau is available at all times to assist county societies and the compensation com-

mittees and individual physicians in all compensation problems. It is strongly recommended that Bureau be consulted in the first instance in all compensation matters rather than the labor department.

Reports from Labor Department—A promise has been obtained from the Deputy Industrial Commissioner to make available to this Bureau and to the local county societies copies of all medical reports issued by the Department of Labor after hearings and examinations. These are now available to the claimant but are not often given to the attending physician. It is hoped in the near future to make these reports available to the various county committees. This should go a long way to avoid or settle disputes as to the necessity for treatment in prolonged cases especially.

Fees for Testimony—The Director appeared by invitation before a meeting of the Industrial Board to discuss the question of fees to be paid for the testimony of physicians and specialists after July 1, 1940. Prior to this time, the fees and rules and regulations were fixed by the Industrial Commissioner. Subsequent to July 1, 1940, the fees and regulations were to be fixed by the Industrial Board. The Industrial Board indicated that it would continue to pay as heretofore and as contained in old Rule 18 of the original schedule.

"The provisions of Section 13-f(2) shall apply only to the physician selected to treat the claimant under the provisions of Section 13-a(1).

"Such physicians are entitled to a fee for attendance at a hearing when subpoenaed by any party in interest or when directed to attend by a Referee or when produced by an insurance carrier or employer.

"When the physician is a general practitioner his fee shall be ten (\$10) dollars plus mileage (outside New York City) and a fee of five (\$5) dollars for each additional case on which he testifies at the same appearance.

"When the physician is a qualified specialist and is so designated, and has examined, consulted or treated under his specialty, his fee shall be twenty-five (\$25) dollars plus mileage (outside New York City) and a fee of twelve dollars and fifty cents (\$12.50) for each additional case on which he testifies at the same appearance.

"A physician, other than the attending physician, who testifies at hearings or examines claimants or participates in examinations for evidential material for compensation hearing purposes only, may accept fees for such services from claimants, employers, or carriers. In no event shall this fee be fixed by the Referee.

"Nothing herein contained shall limit or abridge the power of the Industrial Board in a proper case, where the circumstances warrant, to fix a fee in an amount other than as herein contained."

These regulations shall become effective July 1, 1940.

The determination of whether the physician is to be paid rests with the referee who must make an award if the physician's testimony is required in the case in the opinion of the referee.

X-Rays Ordered by Referee—On June 1, 1940, the Director of Workmen's Compensation of the Department of Labor rendered the following opinion in answer to an inquiry from our Bureau, in reference to an order from a referee to a carrier to produce x-rays at a subsequent hearing, as to the rights of the attending physician to select the roentgenologist.

"It is my opinion that the claimant still retains the right to go to his own physician to have x-rays taken. The order is frequently made as a direction to the carrier in order to give assurance that the x-rays may be available at the next hearing thereby avoiding delay. It is not intended to place a selection of the physician to make this examination in the hands of the insurance carrier."

On June 7, 1940, this matter having been referred to the Industrial Board, it passed the following resolution.

"Resolved, that the Industrial Board believes that the referee should use his discretion when directing an x-ray examination to be made for comparison or evaluating purposes. The Board is of the opinion that the carrier should provide such x-ray examinations and reports generally, but if the referee believes that the claimant should produce the same he may so direct the claimant and if the cost of the x-rays exceeds \$10 he could obtain authorization from the carrier before directing the claimant to produce same."

Your Director protested this resolution as being not in accordance with the spirit and letter of the Workmen's Compensation Law and was given an opportunity to appear before the Industrial Board on June 26, 1940. Your Director at this time argued that where the x-rays are required for diagnosis or for the guidance of physicians of the Department of Labor in expressing an opinion as to disability, scheduled loss, etc., it was the patient's right to choose a qualified physician to take such x-rays and render an expert opinion. Your Director further argued that it was not within the province of the referee in an ordinary case to direct the choice of a physician or of an x-ray expert. It was our opinion that in *controverted* cases where the evidence adduced was of a conflicting nature the Industrial Board or the referee, on the recommendation of a medical examiner of the Department of Labor, had authority to designate an especially qualified physician (roentgenologist) to examine the patient and render a report. In ordinary cases, however, the choice of the roentgenologist lies with the claimant and his attending physician unless the claimant waives his right in writing to free choice.

Under date of July 29, 1940, as the result of this hearing the following action was received from the Industrial Board.

"Resolved, that the Industrial Board hereby rescinds its resolution of June 7, 1940. Further resolved, that the Industrial Board is of the opinion that where the referee directs the taking of x-rays it is the privilege and right of the claimant to furnish such x-rays payment for which shall be in accordance with Section 13-a(5) of the Workmen's Compensation Law."

This resolution was published in the New

YORK STATE JOURNAL OF MEDICINE, September 1, 1940, issue

On December 5, 1940, your Director was informed that the General Manager of the Compensation Insurance Rating Board had considered the above resolution and that the Rating Board and its Medical and Claims Committee were not in favor of the action taken by the Industrial Board. They requested a rehearing, which was scheduled for Friday, December 13, 1940, to which your Director was invited. At this hearing argument was again had along the lines indicated above and the decision of the Board will be rendered on March 14, 1941.

No-Lost-Time Cases—In our report of last year we indicated that doctors were confronted with the situation in which when they submitted bills for medical care of cases from which the patient suffered no lost time or less than seven days lost time the carriers objected to the bills on the ground that compensability was not passed on by the Department of Labor. It was ascertained that the Department of Labor does not make up a file in every accident reported and hearings are not held in many such cases. By agreement with the Compensation Insurance Rating Board after a hearing, the Medical and Claims Committee of the organization held on May 14, 1940, passed the following resolution:

"Resolved, That it is the sense of the medical and claims committee that medical bills should not be honored by the carriers in all cases in which disability does not exceed seven days, provided there has been submitted to the Department of Labor by the carrier form C-6 (notice to the Industrial Commissioner that payment of compensation has begun without awaiting award of industrial board) or form C-7a (report to the industrial commissioner of reason payment of compensation has not begun) and provided such bills conform to all provisions of the law as to reasonableness, timeliness of reports and otherwise, and further that all carriers be notified to this effect."

This disposes of most no-lost-time cases with the exception of those in which the carrier or employer controverts the claim of the injured employee on the grounds of notice of accident or causal relationship. In such cases the C-7 form is filed which requires a hearing before the referee, and in all such cases bills will be held up pending the determination of causal relationship. This leaves us with a residuum of cases in which the patient has been treated and is not entitled to compensation because disability did not exceed seven days in which a C-7 is filed and in which a hearing is called but where the claimant for one reason or another fails or refuses to put in an appearance at the hearing. Your Director has suggested to the Department of Labor and to the insurance carriers' organization a means of controlling this situation, and the matter is still under consideration by the Department of Labor.

Industrial Dermatitis—In last year's report of the Council there was discussed at length the problem of industrial dermatitis. Again this year the Committee met with the representatives of the insurance profession, self-insurers, and their medical expert to consider further the plan suggested by us then and now made more

concrete. Representatives of the Compensation Insurance Rating Board and self-insurers organization have the plan under advisement, and we are hopeful of a meeting of the minds on this subject in the near future. The plan will then be submitted to the Industrial Commissioner, Industrial Board, and the Industrial Council for approval.

Reporting Forms—By arrangement with the labor department, the supplying of forms required by physicians is effected through the local county medical societies. The secretary of the county medical society or chairman of the workmen's compensation committee or board will apply to the nearest district office of the Labor Department for a supply in bulk of the various forms, which will then be available to physicians in the district by mail or personal contact. The expense incurred in mailing forms to physicians who do not call for them should be reimbursed to the society by the physicians. The actual expense of mailing out one pound (about 100 forms) is 7 cents for postage, plus 3 cents to include wrapping, addressing, and notification expense. Physicians are requested not to apply to the labor department for forms but to their own county medical society.

Activities of Bureau—The activities of the Bureau have increased to such an extent that at the request of the Manager of the State Medical Society, Dr. Peter Irving, a brief summary of a typical month's activities of the Bureau was included in the Council report of November 8, 1940. During this one month there were in quires or matters concerning 21 different county societies involving the labor department or one of its divisions, the New York Rapid Transit System, the Corporation Counsel of the City of New York, the State Insurance Fund, and numerous individual insurance carriers and employers, and these were the method of selection of arbitrators in upstate county societies, questions concerning the arbitration of medical bills, questions concerning the right of the county society to make a change in a physician's compensation rating, questions concerning compensability and causal relationship, information concerning the difference between a first-aid station and an employer's medical bureau, and the rules and regulations governing such bureau or first-aid stations, intervention by medical society at request of insurance carrier to appoint a medical examiner on the question of necessity for further treatment, inquiry concerning a hospital rendering bill for anesthesia, questions concerning proration of medical bills of physicians practicing in different counties, conferences with insurance carrier on request of a county society in respect to fee for multiple injuries, adjustment of dispute when physician was rated differently by two county societies, arrangements for arbitration in six upstate counties and appointment of arbitrators, etc., adjustment of dispute between physician applying for compensation rating and a county medical society over fee charged by county society, adjustment of dispute over assistants' fees between insurance carriers and physicians in a county where the local hospital does not provide intern service, information over ownership of x-ray films and appraisal of same by insurance carriers, adjust-

ment of dispute between carrier and county society over failure of carrier to consent to arbitration on question of improper transfer of patient, numerous inquiries in county societies concerning specific fees not mentioned in fee schedule and explanation of fees mentioned in the fee schedule, correspondence with attorney on question of proper fee for hernia operation in a hospital without intern staff, correspondence with division of after care in Department of Labor in silicosis case, correspondence with Compensation Medical Registrar concerning revocation of licenses of physicians throughout the state found guilty of felonies, conferences and correspondence with New York attorneys and with secretary of supreme court justice concerning decision rendered by Appellate term in relation to physicians' bill where either physician or employer has refused to arbitrate, continued correspondence with Compensation Medical Registrar on payment of medical bills in non-insured cases, correspondence with Osteopathic Medical Society, State of New York, on question of charges for x-rays, correspondence with insurance carrier concerning principle involved if physician accepts fee from patient although the labor department has declared no further treatment was necessary and carrier refuses to authorize further treatment, correspondence with out-of-state insurance carriers with relation to proration of physicians' bills, correspondence with out-of-state physicians in reference to applications to practice under the Workmen's Compensation Law of New York State, inquiry from Executive Secretary of the Medical Society of Rhode Island concerning Workmen's Compensation Law.

Among the items considered were fees to be paid to physicians and roentgenologists for multiple x-ray examinations, and hearings were held with insurance carriers and self-insurers and with Industrial Council on this problem.

There was a failure of labor department to index or report compensation case because of lack of appropriation and personnel, negotiations with labor department were held on this problem.

Fees for X-Rays of Multiple Injuries or Parts — A revised reprinting of the fee schedule was published in the course of the year, and a new printing is promised for the near future. This will contain the revisions agreed upon in regard to x-ray fees. The revision of the fee schedule affecting multiple x-ray examinations has been promulgated by the Industrial Commissioner on March 10, 1941. By agreement, the schedule will apply to all unpaid x-ray bills as of November 15, 1940.

X-rays of multiple injuries or parts shall be charged as follows:

- (a) For two contiguous parts, the charge shall be the greater fee plus 50 per cent of the lesser fee,
- (b) For two remote parts, the charge shall be the greater fee plus 75 per cent of the lesser fee,
- (c) For three or more parts, whether contiguous or remote, the charge shall be the greatest fee plus 75 per cent of the total of the lesser fees.

There shall be no charge under this formula

for x-rays of two or more parts or regions included in any line item of the minimum fee schedule.

No charge shall be made for comparative x-rays except when such x-rays are specifically authorized by the carrier or industrial commissioner. Comparative x-rays specifically authorized shall be subject to fees for contiguous and remote parts as provided in this formula.

In explanation of the paragraph following (c) it may be stated that where the x-ray schedule of fees already allows a discount for more than one part, as in items 889-890, 1089-1089a, 1230, 1231, the multiple rule just promulgated does not apply. Thus, if a head and face and two spinal regions were x-rayed by an SD man, the skull fee would apply (\$20) and item No. 889 or \$25, a total of \$45. If, however, a head and face and cervical spine were x-rayed, the skull fee of \$20 would be paid in full plus one-half of item 884 (this being a contiguous single part). The above revision applies only to multiple examinations at one time.

Proposed Amendments to Workmen's Compensation Law — An amendment to the Workmen's Compensation Law passed in 1940 became effective July 1, 1940, and gave to the Industrial Board the power to fix a fee for medical service against a noninsured employer. This law applies to all bills for services rendered on and after July 1, 1940. Such bills, if not paid in full by the employer, should immediately be sent to the Department of Labor, Division of Workmen's Compensation, for action by the Industrial Board.

A bill has been introduced in the present legislature which would permit municipal hospitals that now may treat compensation cases only in emergency and only during the pendency of the emergency to treat compensation cases where the employer or carrier refuses or neglects to authorize hospital services required under Chapter 258, Section 13, and permit the employee to select any hospital for care and treatment in accordance with the rules and regulations prescribed by the Industrial Commissioner. We are opposed to this bill, as a review of the situation indicates no real deprivation of hospital service to injured workmen. Furthermore, compensation cases should not be treated as ward patients but as semiprivate patients, and this type of service is not afforded in municipal hospitals.

A bill introduced this year in the Assembly provides for an amendment to the Workmen's Compensation Law to cover all civil service employees of a municipal corporation or other subdivision of the state except in the uniformed police and fire force.

We endorse again this year an amendment (by the labor department) to the Workmen's Compensation Law permitting applicants for employers' medical bureaus or x-ray laboratories who have been denied a license by a county medical society compensation board, or where the board refuses to act within a reasonable period of time, to apply to the Industrial Council for a review of the refusal or failure and for issuance of a license.

Certain other amendments will be required to integrate this change in Section 13-c and in

other chapters of the law, such as subdivision 4, Section 10-a of the Labor Law

A legislative conference in the Department of Labor, in which this Bureau is included, has under advisement an amendment to Section 13-d(2)c which now reads "has failed to submit full and truthful medical reports required to be made by him to the commissioner, or the industrial board" It is the purpose of the Commissioner to have power to penalize a physician who persistently *refuses* to file reports with the labor department (see above)

Podiatry—From time to time, persons who have been licensed by the state to perform limited functions such as optometry, physical therapy, podiatry, etc., have pressed for independent functions under the education laws of this state. These limited practitioners have, from time to time, attempted to obtain independent authority to treat persons coming within their so-called fields. It has always been the opinion of the organized profession that the primary interest should be the welfare of the citizen. It would not be in the best interests of the public to allow such limited practitioners who are not fully qualified to diagnose medical conditions, and to have independent authority in the treatment of patients. This applies with great force to the Workmen's Compensation Law. Under the provisions of Section 13-b(c), certain limited scope is given to physical therapists and other technicians under the direct and personal supervision of qualified and authorized physicians to treat injured workmen within the range of the licensed practitioner's authority. To permit such practitioners to enter into the practice of accepting cases for treatment without the active supervision of a licensed and qualified medical practitioner is fraught with great danger. An attempt was made this year by podiatrists to obtain the same authority to diagnose and treat foot injuries as is now given under the Workmen's Compensation Law to practitioners of medicine. Aside from the material aspects involved, it would not be in the interests of the injured workman should such partially trained practitioners be allowed to assume independent status in the diagnosis and treatment of injured workmen. It is strongly recommended that any and all attempts to permit partially trained practitioners to practice under the Workmen's Compensation Law be combated for the reasons mentioned above.

PART X

General Matters

There follow in this Section of the Council Report a number of items that fall into different categories

Memorial to Dr Guy S Carpenter—The Council adopted the following memorial

"Dr Guy S Carpenter, of Waverly, New York, member of the Council of the Medical Society of the State of New York, died August 28, 1940, age sixty-six

"His life exemplified the beauty and value of the simple homely virtues. The eminence he attained was out of all proportion to the radius of his professional activities. Honesty, fairness, kindness, devotion to duty, sound judgment, were so marked in him that the knowledge of his

worth went far beyond the small community in which his life was spent, so that he was called to important responsibilities with the State Society of his profession

"Dr Carpenter has served as vice-president, and as councilor of the Medical Society of the State of New York, being the Chairman of its Committee on Publicity for the past three years. He was a past-president of the Tioga County Medical Society and for thirty-three years had served as Waverly Village Health Officer. He was a delegate to the American Medical Association, a member of the New York Sanitar Officers' Association, of the American Association of Anaesthetists, of the Eastern Anaesthetists, and the American Public Health Association

"Though no greater tribute to his character could be offered than that given by his fellow practitioners, yet the esteem of his neighbors in the intimate community which found his daily life as open as a book, must serve as a living memorial to the widow and brother who go the rest of the way without him

"*'Beloved Physician,'* said the *Waverly Sun* in commenting on his death. *'A genial gentleman, who has not only numbered his friends by the legion, but who has been outstanding in humanitarian and community welfare work in this valley for two score years. He had practiced medicine in Waverly since his graduation from Cornell Medical College in 1899. During these forty-one years he has brought hundreds of the present residents of this valley into the world, has brought back countless others from the brink of the grave, and has eased the passing of many more whose time on earth was done.'*

"It was, perhaps, symbolical that Dr Carpenter should be stricken and end his days at the Tioga General Hospital. Because no one was more closely identified with the conception, the building, and the progress of the hospital than was he. For twenty years he had been president of the Old Peoples Hospital in Sayre, the forerunner of the present fine institution in Waverly. Then, when the Tioga General was completed ten years ago he was elected its first president, and for the last eight years he has served as Chairman of its executive committee

"Dr Carpenter was an active member of the Waverly Methodist Church. A member of the Board of Trustees for twenty-five years, at the time of his death he was chairman. He was a member of the Waverly Masonic Lodge and of the Odd Fellows

"Four Methodist clergymen officiated at the funeral, which was attended by seven hundred persons. During the services, the Waverly Free Library was closed, out of respect, he was an original director. The offices of the town of Barton, and a number of private stores and offices, also were closed"

Election of Councilor—At its meeting on October 10, 1940, the Council unanimously elected Dr Floyd S Winslow of Rochester to fill the vacancy created by the death of Dr Carpenter, with term expiring in 1941. Dr Winslow was appointed, on nomination by the President, as Chairman of the Council Committee on Medical Publicity vice Dr Carpenter

Nominations—On request of the State Board of Examiners of Nurses, the Council nominated Dr Peter Irving to succeed Dr Nathan B Van

REPORT OF THE COUNCIL

Etten on expiration of his term as member of the Nurse Advisory Council on December 31, 1940 Dr Irving was appointed for the term of three years from January 1, 1941

On request of the State Board of Medical Examiners, the Council nominated Dr Terry M Townsend to succeed Dr Orrin S Wightman resigning as a member of the Committee on Grievances of the State Department of Education. Dr Townsend was appointed for the term that expires in 1944.

Amendments to the State Education Law — Dr Townsend brought to the Council a request from the Committees on Grievances that it endorse certain recommendations looking toward amendment of the present law as to methods by which the Committee on Grievances does its work. The Council approved these and transmitted its endorsement to the Board of Regents. They were

- 1 The present membership of the Committee consisting of ten shall not be changed
- 2 No change shall be made in the law so as to provide compensation for members of the State Medical Grievance Committee
- 3 It is recommended that the Law be changed so that instead of hearing being held by subcommittees of three, that one of the members of a subcommittee of three of the Medical Grievance Committee be designated by the Chairman as a committee of one to hear and take testimony and report same to the subcommittee of which he is a member, which subcommittee shall make findings and recommendations to the State Medical Grievance Committee. Prior to the meeting of the Medical Grievance Committee the record for each case shall be submitted to each of the members of the said committee so that they may read same prior to reaching a determination upon all the facts
- 4 It is recommended that the Law be changed so that instead of requiring a unanimous vote for guilt that a vote of two-thirds of the members of the full Medical Grievance Committee be deemed sufficient and that the vote of the committee shall be recorded division 4, sentence 3, shall be amended so as to eliminate from that sentence the following language "all cases in which said committee shall deem a trial necessary"
- 5 It is recommended that Section 1265, Subdivision 4, sentence 4, shall be amended so that the provision now pertaining to school of practices shall read "the same school of practice which has a representative on the committee"
- 6 It was understood that, as to No 4, the change from a unanimous vote of all members to a two-thirds vote, would obviate the delay now produced by absence of just one member

Amendment to the Nurse Practice Act — Dr Irving brought back from a meeting of the Nurse Advisory Council information on a question discussed in connection with an amendment to the Nurse Practice Act that had been planned with the approval of the New York State Nurses Association and the Board of Examiners of Nurses. This related to one provision for licensing of practical nurses

This provision is that applications for practical nurse licenses must be "endorsed by two physicians, members of a county medical society". It had given so much extra work to the Board of Examiners' office that the question had arisen of deleting the phrase "members of a county medical society".

After discussion the Council went on record as in favor of retention of the requirement that the endorsing physicians be members of a county medical society. Transmission of this position to the Board of Regents and the State Nurses Association was ordered

Annual Meeting Arrangements — The Council on nomination by the President appointed Dr J Sidney Ritter of New York as secretary of the Section on Urology to take the place of the late Dr Lisle B Kingery

At the suggestion of the New York Society for Medical History, the Council created a new Session of the State Society on the History of Medicine to hold its first meeting at the Annual Meeting of the State Society in Buffalo on April 30, 1941 On nomination by the President, the Council appointed the following officers

Emerson C Kelly, M D, Chairman Albany
George Rosen, M D Brooklyn
Edward F Hartung, M D New York

The Council approved an arrangement recommended by its Committee on Scientific Program that a Round Table Conference on Tumor Clinics be held during the Annual Meeting under the chairmanship of the Director of the Division of Cancer Control of the State Department of Health, Dr Louis C Kress This will occur on Wednesday evening, April 30, 1941

Delegates to Vermont State Medical Society — As exchange delegate to the Annual Meeting of the Vermont State Medical Society the Council appointed, on nomination of the President, Dr Harry Dan Vickers, of Little Falls, and Dr Denver M Vickers, of Cambridge, as alternate Both were able to attend the Vermont meeting and extend the greetings of the Medical Society of the State of New York

PART XI

Other Matters

Still further matters of various nature have been considered by the Council and they are the subjects of this final Section of this Report

Motor Vehicle Drivers — Medical Examinations — Through the Committee on Public Relations and Economics

Augustus J Hambrook, M D, Chairman

Herbert H Bauckus, M D
Louis H Bauer, M D

Troy
Buffalo
Hempstead
contact has been had from time to time with the Commissioner of Motor Vehicles and discussions have taken place on the subject of health of drivers as it may affect their ability to drive safely. Contact was also made with the Commissioner of Mental Hygiene with particular relation to paroled mental cases

Complete accord has been reached regarding recommendations made to the Motor Vehicle Department of the State in connection with licenses to be issued. All persons applying for an operator's license or renewal of such license must sign a certificate as to whether or not they

other chapters of the law, such as subdivision 4, Section 10-a of the Labor Law

A legislative conference in the Department of Labor, in which this Bureau is included, has under advisement an amendment to Section 13-d(2)c which now reads "has failed to submit full and truthful medical reports required to be made by him to the commissioner, or the industrial board" It is the purpose of the Commissioner to have power to penalize a physician who persistently *refuses* to file reports with the labor department (see above)

Podiatry—From time to time, persons who have been licensed by the state to perform limited functions such as optometry, physical therapy, podiatry, etc., have pressed for independent functions under the education laws of this state. These limited practitioners have, from time to time, attempted to obtain independent authority to treat persons coming within their so-called fields. It has always been the opinion of the organized profession that the primary interest should be the welfare of the citizen. It would not be in the best interests of the public to allow such limited practitioners who are not fully qualified to diagnose medical conditions, and to have independent authority in the treatment of patients. This applies with great force to the Workmen's Compensation Law. Under the provisions of Section 13-b(c), certain limited scope is given to physical therapists and other technicians under the direct and personal supervision of qualified and authorized physicians to treat injured workmen within the range of the licensed practitioner's authority. To permit such practitioners to enter into the practice of accepting cases for treatment without the active supervision of a licensed and qualified medical practitioner is fraught with great danger. An attempt was made this year by podiatrists to obtain the same authority to diagnose and treat foot injuries as is now given under the Workmen's Compensation Law to practitioners of medicine. Aside from the material aspects involved, it would not be in the interests of the injured workman should such partially trained practitioners be allowed to assume independent status in the diagnosis and treatment of injured workmen. It is strongly recommended that any and all attempts to permit partially trained practitioners to practice under the Workmen's Compensation Law be combated for the reasons mentioned above.

PART X

General Matters

There follow in this Section of the Council Report a number of items that fall into different categories.

Memorial to Dr Guy S Carpenter—The Council adopted the following memorial:

"Dr Guy S Carpenter, of Waverly, New York, member of the Council of the Medical Society of the State of New York, died August 28, 1940, age sixty-six.

"His life exemplified the beauty and value of the simple homely virtues. The eminence he attained was out of all proportion to the radius of his professional activities. Honesty, fairness, kindness, devotion to duty, sound judgment, were so marked in him that the knowledge of his

worth went far beyond the small community in which his life was spent, so that he was called to important responsibilities with the State Society of his profession.

"Dr Carpenter has served as vice-president, and as counselor of the Medical Society of the State of New York, being the Chairman of its Committee on Publicity for the past three years. He was a past-president of the Tioga County Medical Society and for thirty-three years had served as Waverly Village Health Officer. He was a delegate to the American Medical Association, a member of the New York Sanitary Officers' Association, of the American Association of Anaesthetists, of the Eastern Anaesthetists, and the American Public Health Association.

"Though no greater tribute to his character could be offered than that given by his fellow practitioners, yet the esteem of his neighbors in the intimate community which found his daily life as open as a book, must serve as a living memorial to the widow and brother who go the rest of the way without him.

"*'Beloved Physician,'* said the *Waverly Sun* in commenting on his death. 'A genial gentleman, who has not only numbered his friends by the legion, but who has been outstanding in humanitarian and community welfare work in this valley for two score years. He had practiced medicine in Waverly since his graduation from Cornell Medical College in 1899. During these forty-one years he has brought hundreds of the present residents of this valley into the world, has brought back countless others from the brink of the grave, and has eased the passing of many more whose time on earth was done.'

"It was, perhaps, symbolical that Dr Carpenter should be stricken and end his days at the Tioga General Hospital. Because no one was more closely identified with the conception, the building, and the progress of the hospital than was he. For twenty years he had been president of the Old Peoples Hospital in Savre, the forerunner of the present fine institution in Waverly. Then, when the Tioga General was completed ten years ago he was elected its first president, and for the last eight years he has served as Chairman of its executive committee.

"Dr Carpenter was an active member of the Waverly Methodist Church. A member of the Board of Trustees for twenty-five years, at the time of his death he was chairman. He was a member of the Waverly Masonic Lodge and of the Odd Fellows.

"Four Methodist clergymen officiated at the funeral, which was attended by seven hundred persons. During the services, the Waverly Free Library was closed, out of respect, he was an original director. The offices of the town of Barton, and a number of private stores and offices also were closed."

Election of Councilor—At its meeting on October 10, 1940, the Council unanimously elected Dr Floyd S Winslow of Rochester to fill the vacancy created by the death of Dr Carpenter, with term expiring in 1941. Dr Winslow was appointed, on nomination by the President, as Chairman of the Council Committee on Medical Publicity vice Dr Carpenter.

Nominations—On request of the State Board of Examiners of Nurses, the Council nominated Dr Peter Irving to succeed Dr Nathan B Van

"I have a report from Mr. Bienstock stating that from January 1, 1940, to date, 29 cases of illegal practice of medicine have been prosecuted and concluded in the courts. There are, in addition, 14 other cases pending in the courts. Besides this, Mr. Mangan reports to me that he has in process of preparation as of the first of October 20 cases. You understand, of course, that all complaints of illegal practice or of other procedures subject to criminal action are handled first in Mr. Mangan's office. Under his direction the evidence is secured by the medical investigators and the case prepared for submission to the Attorney General. The latter conducts the legal proceedings from that point on. I assume also that you understand that the Department proceeds only on the basis of information which comes to it through complainants. We do not and cannot make independent surveys to uncover violations of the law."

Assurance was given that a report would be made regarding this work by the Department each year in future.

Eichacker vs. New York Telephone Company — At the time of your last meeting the status of this case was that the Telephone Company had appealed a decision in favor of Dr. Henry C. Eichacker, also, the Society had agreed, if formally requested, to take over defense of the appeal through its own attorney. No such formal request was made.

During the summer the appeal was decided adversely to Dr. Eichacker. The Secretary authorized the doctor's attorney to file notice of further appeal by Dr. Eichacker to come up in the fall when the Council would be in a position to decide on what position it would see fit to assume in regard to the further appeal. The Council approved this action of the Secretary and, after full discussion, finally gave authority to Mr. Brosnan, the Society's legal counsel, to intervene in the appeal as *amicus curiae*. This Mr. Brosnan did in due course, and the court granted the application for intervention. The appeal is at this time (March 15, 1941) still pending.

Basic Science Law — At your last meeting you discussed a possible Basic Science Law which had been proposed for New York State by resolu-

tion introduced by Dr. Charles Gullo of Livingston County. You referred this matter to the Council for further study.

Your Council discussed this matter fully and arrived at the conclusion that it is best to leave the situation in New York State in this regard as it stands at present rather than to foster the introduction of a Basic Science Law.

PART XII

State Society Assessment and Military Service

The Council has received many queries from the component county medical societies as to relief from payment of State Society assessments for members called into military service. In reply, the Council has stated that it did not have authority to remit assessments except as provided in the Bylaws for illness, and that therefore the matter would be brought to the attention of the House of Delegates.

The Council did go on record with an opinion that the relief from assessment for the calendar year 1940 should not be in question because those assessments should have been paid by May 31, 1940, which was before the passage of the Selective Service Act. In regard to the State Society assessment for 1941, however, the Council begs to present the following resolution.

"Be it resolved by the House of Delegates of the Medical Society of the State of New York assembled in annual meeting at Buffalo, New York, on April 28, 1941, that the annual per capita assessment on members of the component county medical societies shall remain as at present, namely, ten dollars per annum, and

"Be it further resolved that, on the request of any component county medical society, the annual assessment on any of its members temporarily on active duty in the military or naval service of the United States may be remitted by the Council in full or in part during the period of such service."

Respectfully submitted,
PETER IRVING, M D, *Secretary*

March 15, 1941

Report of the Treasurer

To the House of Delegates, Gentlemen

The accompanying financial statement is abstracted from the auditors' report for the calendar year 1940. A more complete analysis of the Society's financial affairs will be pre-

sented by your Treasurer at the Annual Meeting.
Respectfully submitted,

GEORGE W. KOSMAK, M D, *Treasurer*
March 6, 1941

AUDITORS' STATEMENT

We have completed our examination of the books and records of the Medical Society of the State of New York for the year ended December 31, 1940, have reviewed the system of internal control and the accounting procedures of the Society, and have examined or tested accounting records of the Society and other supporting evidence by methods, at times, and to the extent we deemed appropriate.

In our opinion, the accompanying balance sheet and related statements of income and capital present fairly the position of the Society at December 31, 1940, and the results of its operations for the year ended that date.

Respectfully submitted,
J. K. LASSER & Co.,
Certified Public Accountants

February 28, 1941

are suffering from or have ever suffered from any of the following

Insanity	Hypertension
Epilepsy	Nephritis
Coronary Thrombosis	Drug Habit
Angina Pectoris	Physical Deformities
Diabetes	Loss of an Extremity or Part of an Extremity

No license will be issued to a known epileptic

As regards insanity, the Commissioner contemplates legislation which will require that the license of a person committed to a mental hygiene hospital shall be taken up and transmitted to the Motor Vehicle Department, same to be returned to the individual only on certificate of competent examining physician

Persons suffering from heart disease and nephritis are to be issued licenses only after examination and certificate from examining physician. Diabetics must furnish certificate that constant care is being supervised. No licenses are to be issued to drug addicts

In the case of physical deformities, persons must demonstrate to the satisfaction of the Bureau of Motor Vehicles that they are not incapacitated from driving under such restrictions

It has been recommended that all persons over seventy should have a physical examination before license is issued

Regarding drunken drivers, tests are now available to determine alcoholic content in the blood and legislation is contemplated which will permit such tests to be made where accidents have occurred. The medical profession has not as yet passed upon the proposed tests, but at least two other states have incorporated them in their restrictions

It is the opinion of the Committee that in many instances of diseased conditions known to physicians and not reported as such to the Motor Vehicle Department the individuals could be discouraged by their physicians from asking or soliciting motor vehicle licenses. Very cooperative action has been taken to prevent the increasing number of accidents in this state, and it is hoped that by incorporating the suggestions made a lessening may be possible

Deaf and Hard of Hearing.—The Deaf and Hard of Hearing Committee (Dr Hambrook) has cooperated during the year with the State Commission for the Deaf and Hard of Hearing

Due to the fact that many children are unable, because of hearing defects, to acquire satisfactory education in their regular school classes, legislation has been sought to have lipreading instruction, voice training, and other hearing aids necessary to enable such children to acquire the education so necessary for proper success in after life

A survey has been made as to the number of such children who would be benefited by lipreading instruction, and a fair estimate of about 70,000 in the state has been made. If and when this legislation is enacted it will mean that at least 20 per cent of the pupils attending deaf schools in the state will be returned to their regular school classes. These have been in deaf schools because no satisfactory means has been available for education in the regular schools

The Committee, in cooperation with the State Commission for the Deaf and Hard of Hearing,

has recommended to the Legislature of the State of New York and to Governor Lehmann that the Commission be continued to enable them to complete a study being made of the deaf and hard of hearing adults with special skills and available in industry for replacements during the crisis in medical preparedness

Attention has also been directed to Civil Service laws and regulations regarding the deaf and hard of hearing and to more rational ratings in compensation cases. A special study of this phase of the work has been made by Dr Edmund Prince Fowler of New York, an eminent otolaryngologist and a member of both the State Medical Society and the State Commission for the Deaf and Hard of Hearing

The early recognition of hard of hearing cases, the elimination—in so far as possible—of the causative factors, the prompt and efficient treatment of cases when discovered, and the complete and proper education of the handicapped hearing individual have been given serious consideration by this Committee. The two laws now on the statutes, viz the reporting of all deaf and hard of hearing children, and the annual examination of hearing of all children in the schools of the State, will make possible early discovery. Correct and efficient treatment should follow this discovery. Lipreading instruction, voice culture and other hearing aids required for specific cases will make possible the type of education so necessary

The adult deaf and hard of hearing have been given serious consideration. Questions pertaining to Civil Service, labor preferment and placement, rehabilitation and re-education, especially in skilled industry, have all been dealt with by the combined efforts of the State Commission for the Deaf and Hard of Hearing and the Committee of the Medical Society of the State of New York.

Civil Service rules and regulations are naturally very rigid and the applicant is subject to exacting mental and physical examinations. Those with the handicap of deafness, consequently, find themselves practically excluded from this field, but the tendency in recent years, both in Federal Government and in State Government, has been to modify arbitrary and rigid rules and thus enable the otherwise qualified deaf and hard of hearing persons to compete with others for governmental positions

The right of the deaf and hard of hearing to drive motor vehicles has also been considered, and a review of the instances of accidents proves a very small proportion of accidents caused by deaf or hard of hearing drivers. No one who has given serious thought to the subject will deny the truth of these assertions. The deaf or hard of hearing drivers are of necessity more careful and cautious and, unless other handicaps are associated or individual cases are of such severity, it is the opinion of the combined group that they (the deaf or hard of hearing) should not be excluded from licensure

Medical Practice Act Enforcement.—Through Dr Hambrook's Committee a request for information was proffered as to enforcement of the Medical Practice Act by the Department of Education. A letter was received under date of October 15, 1940, from Associate Commissioner Milton E. Loomis

REPORT OF THE COUNSEL

Report of the Counsel

To the House of Delegates, Gentlemen

Your Counsel herewith submits his report of the activities of the Legal Department of the Medical Society of the State of New York for the period from February 1, 1940, to and including January 31, 1941.

Within the reasonable confines of a report of this character nothing but the barest outline of the work done in our department can be given. Conclusions only can be stated, but these do not give any adequate picture of the work done or the responsibility assumed by our department.

As in other years we again record our appreciation for the assistance and cooperation furnished by your officers and your committeemen. It has indeed been a pleasure to work with them.

In making his report, your Counsel adheres to the convenient category employed in previous years whereby his activities have been divided into three main divisions: (a) the actual handling of malpractice actions before courts and judges and in the appellate tribunals, (b) counsel work with officers, committees, and individual members of the Society, and (c) legislative advice and activities.

Litigation We again call to the attention of the members the dangers done by careless, hasty, and unjustified criticism by one physician of the work of another. Of course, we realize that in most instances the criticizing doctor does not intend that the patient shall commence a malpractice action based on his comment, but it is equally true that in these parlous times not much is needed to plant in the mind of a patient the seed of litigation against another physician. It is a fact, although not always susceptible of proof, that many malpractice actions stem from just such criticism.

It is pertinent at this point to call to the attention of the members of your Society, as we have done in previous years, the ever-present hazard of a malpractice action to the practicing physician. It further should be noted that the rights of the physicians in malpractice actions are in the hands of lay jurors, who, at times, are unduly influenced by sympathy, passion, prejudice, or bias. It was the recognition of these factors that many years ago led the State Society to initiate a group plan of malpractice insurance. For a period of nearly twenty years this plan has been in operation. It was recognized at the outset that a union of defense and indemnity was essential to the success of the Group Plan. The outstanding success of this plan is a matter of record.

The Group Plan is one of the most important activities of your Society, and it deserves the loyal support of every member. We should have more insured members in the Society than we now have. We have heard many expressions of regret voiced by uninsured members who have been sued over their failure to take advantage of your Group Plan.

At this point we should make mention of the fine spirit of cooperation displayed by everyone connected with the Yorkshire Indemnity Company, the carrier under your Group Plan. Now entering their sixth year as such carrier, they have lived up in every way to all of the obligations assumed and, in addition, have shown

themselves to be genuinely and enthusiastically interested in assisting us in every way to make the Group Plan successful. We record our appreciation of the cooperation furnished by Mr. Horace Crowell, Jr., claim agent of the Yorkshire Indemnity Company, with whom your Counsel and office staff are in almost daily conference and consultation.

We should also make mention of the splendid work of your Insurance Committee headed by Dr. Clarence G. Bandler and Mr. Harry F. Wansentative. With these gentlemen your Counsel has conferred on a number of occasions during the reporting period.

For the past decade appreciation has been expressed in my report for the splendid work of my associates, Mr. William F. Martin and Mr. Thomas H. Clearwater, the attorney for the Society. I do so again this year. Mr. Martin's reputation in the defense of malpractice actions is well and favorably known throughout the entire state. In the thirteen years he has been engaged in this work he has come to grips in a practical way with every sort of medicolegal problem. His experiences in this field have won for him expressions of the highest approval from judges, lawyers, and doctors in all parts of the state, not only for his exceptional ability as an advocate but for his fine personal qualities as well.

Mr. Thomas H. Clearwater, the attorney for your Society, has had close contact over many years with the members and with its officers and committeemen. Mr. Clearwater is a gentleman of exceptional ability and character, and he has rendered to your Counsel at all times the fullest measure of cooperation and support.

We cannot leave this subject without paying tribute to the splendid spirit of industry, loyalty, and devotion manifested by your Counsel's entire staff, both legal and clerical.

With this preliminary statement, we note that there were commenced in the present reporting period 131 cases as against 170 last year. These figures, of course, do not include a number of claims outstanding on which suit may ultimately be brought. Of equal importance with the actual work of litigation is the preventative work done by your Counsel and his office staff. Throughout the year we are in consultation with many claimants and their attorneys, and frequently we have been successful in demonstrating to them in fact and in law that no valid claim exists. Thus these claims never reach a suit stage.

Table 1 shows that during the present reporting period we disposed of 145 cases as against 191 disposed of during the previous reporting period. Forty of these cases were settled, and, of the balance, 103 were successfully terminated in favor of the physicians. Two cases resulted in judgments in favor of the plaintiff as opposed to three verdicts for plaintiffs in the prior reporting period.

We note from Table 1 that there were pending cases as of January 31, 1941, 406 cases as against 420 cases pending on January 31, 1940.

Table 2 gives a comparison of the number of members insured in 1938, 1939, 1940, and 1941, the number of members in the county societies,

Report of the Board of Trustees

To the House of Delegates, Gentlemen

I have the honor to report for the Board of Trustees on its supervision of the financial affairs of the Society during the past fiscal year.

It has carried out the following routine duties. Contracts with the General Manager and Executive Officer were renewed, as were contracts with Mr. Kent Lighty for securing advertisements for the *JOURNAL* and *Directory* and for sale of technical exhibit space for the 1941 Annual Meeting. Lease of the Albany office has been renewed for three years at the same terms, to begin in April, 1941. The budget for the fiscal year 1940-1941 was adopted as recommended by the Council. Later in the year the Board adopted a tentative budget for the calendar year 1941, subject to the action of the House of Delegates on the amendment changing the fiscal year to correspond with the calendar year and the dues year. Following the move of the New York office certain additional appropriations for moving expenses were needed and were approved.

On recommendation of the Council, the Board approved a change of auditors, it being understood that the new auditors, J. K. Lasser & Company, would make a more comprehensive audit of the books of the Society than had been done

in previous years. In this connection the Board approved the setting up of a new bookkeeping system suggested by the auditors and approved by the Treasurer.

On recommendation of the Council, the Board approved additional appropriations for medical preparedness, and also for studies of compilation system for the *Directory* and the Society's files.

The main concern of the Board throughout the year has been the study of investments. In this connection it has had the continuous advice of the Chase National Bank. Where it has seemed wise to dispose of any investments, the Board has, in accordance with advice, preferred to keep the money in the form of cash in savings banks.

In general, the Board is glad to report that the financial condition of the Society is sound, that it has continued to live within its income from dues without curtailing its activities.

Respectfully submitted,
JAMES F. ROONEY, M.D.
GEORGE W. COTTIS, M.D.
WILLIAM H. ROSS, M.D.
THOMAS M. BRENNAN, M.D.
HARRY R. TRUCK, M.D., *Chairman*

and the percentage of insured members in the county societies and in the entire State Society

Counsel Work. During the period of this report your Counsel prepared for the Society's JOURNAL articles in the nature of editorial comment. These articles have included the following:

Malpractice—Sufficiency of Evidence, Disciplinary Proceedings—Effect of Pardon, Negligence—Injuries to Nursing Infant, Physical Examinations in Personal Injury Actions, Label of a Physician, Quackery as Grounds for Disciplinary Action Against Physician, Liability of Hospital for Negligence of Nurse, Charitable Hospitals—Liability for Malpractice of Physician

Your Counsel has also digested reports of cases concerning malpractice actions held to be of interest to the members of the medical profession. From time to time during the reporting period, these case reports appeared in the JOURNAL and included the following:

Treatment of Fractured Leg, X-Ray Treatment of Malignancy, Fistula Following Delivery, Plastic Surgery of the Face, Alleged Erroneous Diagnosis of Tuberculosis, Complications Following Appendectomy

Your Counsel is pleased to learn from the members of your Society, from time to time, that they enjoy reading these reports and articles and that they find them to be interesting and instructive.

Inquiries. In addition to his other duties your Counsel receives frequent requests for opinions, orally and in writing, on various topics. Some of the matters upon which advice has been given (in writing) are the following:

1 Inquiry from a physician as to the individual liability of a hospital intern when sued for malpractice and further as to whether the hospital would be liable for any judgment obtained against the intern

2 Query as to whether a privately owned hospital has an absolute right to determine what doctors should be members of its staff, or allowed

to perform major surgery, and to make rules and regulations to govern the conduct of the staff

3 Request for advice as to the necessity of advising a patient that a broken surgical needle remained within his finger

4 Several requests for advice as to the extent to which a physician may testify in Court as to the physical condition of a patient without violating the Statute with respect to confidential communications.

5 Inquiry by a medical director of a publicly owned and operated institution as to the possibility of his becoming involved in a malpractice action and the possible results of such action.

6 Inquiry as to the possible personal liability in cases of anesthesia accidents of a physician associated with a hospital as its superintendent

7 Request for information as to the extent a physician may be required to give expert testimony when compelled to attend Court on an ordinary subpoena.

8 Inquiry as to whether a county welfare commissioner has the proper power to limit the earnings of physicians to a stated amount for any calendar year and for any one month

9 Request for advice as to whether a physician who has some years before treated a patient is disqualified from examining the same patient upon Court order in the course of litigation involving that patient.

10. Request for opinion as to whether a duly licensed practicing physician is entitled legally to change his name without a court order

11 Inquiry regarding legal responsibility that might be incurred by a group of physicians serving as an advisory medical board to a hospital.

12 Request for advice with respect to whether an elderly patient should be told after an operation that there was a possibility, though not a certainty, that a sponge was left in his abdomen

13 Inquiry from a physician as to whether a breach of the confidential relationship between

F Jurisdiction of Board of Censors

Amendments

A Change of Dues Year and Fiscal Year

This has to do with change of the Dues Year and Fiscal Year so that both shall coincide with the Calendar Year. Previous to 1939 the Dues Year had been the Calendar Year while the Fiscal Year had begun July 1 and ended June 30 of the succeeding year. In 1939, the House of Delegates had retained the Fiscal Year from July 1 to June 30, but changed the Dues Year to coincide with the Fiscal Year. Because this was found impractical, particularly as related to the change in the Dues Year, the Council submitted an amendment in 1940 so that both Dues Year and Fiscal Year shall hereafter coincide with the Calendar Year, as follows:

*Chapter I—Board of Trustees, Section 2—*Change last sentence by deleting word, "July 1," and "June 30 of the following year," and inserting the words "January 1" and "December 31 of each calendar year" making it read

"The fiscal year shall begin January 1 and end December 31 of each calendar year."

*Chapter I—Membership, Section 2—*Change (a), last sentence, by deleting the words "July 1 to June 30 of the succeeding year," and inserting the words "January 1 to December 31 of each year," making it read

"The dues year shall coincide with the fiscal year, January 1 to December 31 of each year."

*Chapter I—Section 2—*Change (b), first sentence, by deleting the words "December 31," and inserting the words "May 31" making it read

"A member whose dues and assessments are unpaid after May 31 of any current year is not in good standing."

Change (c) by deleting the words "June 30," and inserting the words "December 31" making it read

"A member whose dues and assessments are unpaid after December 31 of any current year shall automatically be dropped from the rolls of membership of both county and state societies, without notice to such member by"

Delete (d), which now reads "The change of the dues year shall first become operative."

Change (e) by deleting the words "May 1," and "Ensuing fiscal" and inserting the words "November 1," and "succeeding," making it read

"Dues and State assessment of a member elected or reinstated after November 1 shall be credited to the succeeding year, all rights and privileges of membership, however, dating from the time of election."

B Amendment of Previous Amendment

This was notice that the Medical Society of the County of Kings had resolved to amend the preceding amendment, *Chapter I, Section 2 (e)*, to make that portion read

"Dues and State assessment of a member elected or reinstated after October 1 shall be credited to the succeeding year, all rights and privileges of membership, however, dating from the time of election."

C. Rearrangements of Sessions of the House of Delegates

This amendment was presented to the 1940 House of Delegates by Dr. Peter Irving, General Manager, reading as follows:

Chapter III, Section 4, the first sentence shall be altered by the substitution of the words "last day" for the words "second day" making the first sentence of Section 4 read

"The first order of business on the last day of the session of the House of Delegates of each annual meeting shall be the nomination for officers of the Society and other members of the Council, a member of the Board of Trustees, delegates to the American Medical Association, and the appointment of a sufficient number of tellers by the Speaker."

The House instructed the Council to reword this amendment in order to clarify its meaning. This the Council has done, at the same time taking cognizance of notice of an amendment by Dr. Arthur J. Bedell that would add a new Section to Chapter II of the Constitution to the effect that

"No new resolution may be presented on the last day of session of the House of Delegates without a two-thirds affirmative vote."

These two amendments have been fitted together by the Council with the full approval of Dr. Bedell, and the result follows:

Chapter II, Section 3, add three additional sentences, instead of adding a new section, to read

"At least thirty (30) days before the Annual Meeting of the House of Delegates, the Speaker shall announce a schedule of the adjourned sessions of the House of Delegates. This schedule may be amended by the House of Delegates during its convention. No new resolution shall be introduced at the last scheduled session except by a two-thirds vote of the House."

Chapter III, Section 1, to effect the purpose of the amendment to Chapter III, Section 4, it was found necessary to change the first sentence of this Section by deleting the words "second day's," and inserting the words "last scheduled," making it read

"The Officers, members of the Council and of the Board of Trustees of the Society, and the Delegates to the American Medical Association shall be elected as the first business of the last scheduled session of the annual meeting of the House of Delegates."

ment rendered to a plaintiff at a time when she had been his patient

23 Inquiry concerning the rights of one physician to reveal to another physician confidential matters concerning a patient

24 Request for various forms of consents to operations, and for forms of release for use when patient leaves hospital against his physician's advice

25 Inquiry from a physician as to the propriety of his giving information to the attorney for a man who was suing his wife for annulment, which information would relate to the physical condition of the wife prior to their marriage.

26 Request from a county medical society for advice as to whether certain action could legally be taken by resolution, rather than by amendment to bylaws

27 Inquiry from the secretary of a county medical society as to the type of consent necessary for a sterilizing operation.

28 Inquiry from the secretary of a county society as to whether paid notices in programs of charitable functions inserted by physicians constitute a violation of Medical Ethics

29 Request for an opinion as to the applicability in New York State of a case decided in another jurisdiction relating to the disciplining of physicians

30 Request by the secretary of a county society for opinion as to whether certain acts by a physician constitute advertising and a basis for disciplinary action

At the request of the House of Delegates, your Counsel during the past year has published, from time to time, in the Society's JOURNAL certain such inquiries together with your Counsel's answer to such inquiries, which related to subjects of general interest to the members of the profession

Other Counsel Activities Your Counsel, acting with the Committee on Bylaws, examined various proposed amendments to the Constitution and Bylaws of the State Society and of a number of component county societies and has rendered advice and made suggestions in connection therewith

Your Counsel drew the contracts between Mr Kent Lighty and the State Society with reference to advertising matter in the NEW YORK STATE JOURNAL OF MEDICINE, the *Medical Directory of New York, New Jersey, and Connecticut*, and the Commercial Exhibits

Your Counsel also drew the contract between the Society and Dr Joseph S Lawrence, its executive officer

Your Counsel drew the contract between the Society and Dr Peter Irving, its secretary and general manager

Your Counsel drew the contract between the Society and Mr Dwight Anderson, as director of the Public Relations Bureau and business manager of the NEW YORK STATE JOURNAL OF MEDICINE and the *Medical Directory of New York, New Jersey, and Connecticut*.

Your Counsel has conferred at various times with members of the various committees on certain phases of their work

Your Counsel attends and advises at the monthly meetings of the Council of your Society

Mr Clearwater, the attorney for the Society, has been in consultation with the Joint Committee on Medical Jurisprudence to cooperate with the Special Committee of the Bar Association and has attended a number of meetings of the Bar Association in connection therewith.

In addition to the above, your Counsel is constantly in communication by telephone and letter with Dr Peter Irving, secretary and general manager of the *Medical Society of the State of New York*, with regard to the many questions that arise almost daily in connection with his work.

Also it should be noted that daily telephone calls from members of the Society come to your Counsel and his office staff which require advice and assistance on various problems in connection with the members' practice. Most of these telephone inquiries present emergency situations that cannot be handled by correspondence

Legislative Advice and Activities. At the writing of this report the legislature has been in session about one month.

Your Counsel has already examined some bills affecting the medical profession and has given advice with respect thereto

Conclusion. Once again in closing this report, we record our grateful appreciation to the members of your Society who have assisted us in the defense of malpractice actions both in court and in consultation. Without their assistance so generously given we could not have obtained the results shown in this report

Respectfully submitted,
LORENZ J BROSNAN, Counsel

Amendments to Constitution and Bylaws

To the House of Delegates, Gentlemen

At your last meeting there were considered seven separate amendments to the Constitution and Bylaws, two of which have now been combined. These amendments were placed on the table for action at the 1941 session, and they will not go to reference committees but to you as a whole. It is earnestly requested that each and every member digest these in advance and be prepared for discussion. Under the present bylaws "the affirmative vote of two-thirds of the House of

Delegates present and voting shall be necessary for adoption." These amendments cover

- A Change of Dues Year and Fiscal Year
- B Amendment of Previous Amendment
- C Rearrangement of Sessions of the House of Delegates
- D Payment of Expenses of District Branch Presidents Attending the House of Delegates as District Delegates

"Hospitalization, in the Zone of the Interior and in the Theatre of Operations," Colonel Floyd Kramer, M C, U S A., post surgeon, Fort Totten, New York, "The Practical Phases of the Early Recognition and Management of Shock," Dr Virgil Moon, professor of pathology, Jefferson Medical College, "Aviation Medicine," Lieutenant-Colonel Charles L. Maxwell, M C, U S A., post surgeon, Mitchel Field.

Between the morning and afternoon sessions, there was a luncheon at the Officers' Club which was attended by 240 physicians and members of the Woman's Auxiliaries of the four county societies composing the branch. This was the largest attendance ever recorded at any meeting of the branch. Dr James M. Flynn, president of the Medical Society of the State of New York, addressed the gathering.

The four Woman's Auxiliaries held a morning session at the Officers' Club, and an afternoon session at the same place. The afternoon session was addressed by Dr Kopetzky, president-elect of the Medical Society of the State of New York.

A short business session was held immediately after the luncheon and the following officers were elected for the term 1941-1943: president, Dr Burdge P. MacLean, Huntington, first vice-president, Dr Francis G. Riley, Jamaica, second secretary-treasurer, Dr John B. D'Albora, Brooklyn, Brooklyn.

Besides Dr Flynn and Dr Kopetzky, other officers of the State Society who honored us by their presence were Dr Peter Irving, secretary and general manager, and Dr Joseph S. Lawrence, executive officer. Thanks are due to Dr Mrs Luther H. Kice, president of the State Auxiliary, and Mrs A. C. Martin, president of the Nassau County Auxiliary, who arranged the auxiliary meeting.

During my two-year term of office, I have twice visited each county society composing the branch.

Respectfully submitted,
L. H. BAUER, M D, *President*
February 1, 1941

Report of the Third District Branch *To the House of Delegates, Gentlemen*

The thirty-fourth annual meeting of the Third District Branch of the Medical Society of the State of New York was held at the Colonne Country Club at Albany on September 17, 1940. During the morning and afternoon sessions there were presented several timely papers by recognized authorities and these were much discussed by those present at the meeting. Among the subjects presented were "Gastric Hemorrhage," "Present Status of Sulfathiazole," "Observations on Human Refrigeration," "Specific Treatment of Pneumonia," and "Spa Therapy."

At the noon luncheon, Dr James M. Flynn, president of the State Society, made a brief but pertinent address, this was followed by a short discussion by Dr Peter Irving, secretary of the State Society. Mr Dwight Anderson, director of the Public Relations Bureau of the State Society, took a bow. Also Dr Louis C. Kress,

director of the State Health Department, Division of Cancer Control, spoke briefly on the problem of registration of cancer cases.

Following the luncheon period, election of officers took place with the following results: president, Dr Mahlon H. Atkinson, Catskill, first vice-president, Dr Stephen H. Curtis, Troy, second vice-president, Dr Homer L. Nelms, Albany, Secretary, Dr Harry Golembe, Liberty, Treasurer, Dr Henry C. Galster, Hudson.

A total of eighty-six persons attended this meeting, of whom ten were not members of the district. The largest group came from Albany County, Rensselaer County was quite well represented, and attendance from other counties of the district varied from two to four members from each. When the high standard of the program and its practical value to the general physician are considered, the attendance at this meeting was far below what it should have been. A factor that may have contributed to the poor attendance was the delay in receiving of meeting, it required daily calls to the New York office to expedite the releasing of the programs. They finally came but most members of this district did not receive the programs until the day before the meeting and some had not yet received their copies when they arrived at the meeting. Obviously, such delay is a serious handicap if attendance at the meetings is to be maintained.

Respectfully submitted,
ARTHUR M. DICKINSON, M D, *President*
February 11, 1941

Report of the Fourth District Branch *To the House of Delegates, Gentlemen*

The thirty-fourth annual meeting of the Fourth District Branch of the Medical Society of the State of New York was held on Tuesday and Wednesday, October 1 and 2 1940, at the Hotel Van Curler, Schenectady.

The meeting opened with a scientific session on Tuesday, October 1, at about 2 00 P. M. The following papers were presented: "Proprietary Medicines," by Dr A. H. Aaron, Buffalo, professor of clinical medicine, University of Buffalo School of Medicine, "Problem Fractures about the Elbow," by Dr Clay Ray Murray, New York, associate professor of surgery, College of Physicians and Surgeons, Columbia University, "Acute Cardiovascular Emergencies," by Dr John E. Detrick, New York, "Convalescence at the Spa," by Dr Edward J. Callahan, Saratoga Springs.

These papers were received with a good deal of interest by the members present and were well discussed.

Following the papers the meeting was briefly addressed by Dr Louis C. Kress, director of the Cancer Control Division of the New York State Department of Health, who endeavored to impress on our members the necessity and importance of reporting cases of malignant tumors. A business meeting followed, at which time the following officers were elected for the years 1941-1942: president, Dr E. Harrison Ormsby, Amsterdam, first vice-president, Dr William

Chapter III, Section 4, change the first sentence of this Section by deleting the words "on the second day of the session of the House of Delegates of each Annual Meeting," and inserting the words "at the last scheduled session of each Annual Meeting of the House of Delegates," making it read

"The first order of business at the last scheduled session of each Annual Meeting of the House of Delegates shall be the nominations for officers of the Society "

D Payment of Expenses of District Branch Presidents Attending the House of Delegates as District Delegates

Dr Theodore West of Westchester County introduced the following amendment at the 1940 House of Delegates to amend *Chapter X, Section 1*, by insertion of an additional sentence after the fifth sentence to read

"Presidents of the District Branches sitting in the House of Delegates shall be allowed necessary expenses "

E Duties of Officers

Dr George W Kosmak introduced the following amendment at the 1940 House of Delegates to amend *Chapter VII*, by insertion of a new section, *Section 10-A*, to read

"An assistant to the Treasurer shall be appointed annually by the Council at its organization meeting, who shall serve and be subject to the supervision and order of the Treasurer, shall be adequately bonded, have

no voice or vote in any meeting, shall be suitably remunerated through an order of the Council and be empowered to sign checks in special rotating funds to be set up as needed by the Trustees "

F Jurisdiction of Board of Censors

Dr Peter Murray of New York County introduced the following amendment at the 1940 House of Delegates to amend *Chapter VI, Section 2*, by repealing and deleting therefrom the second sentence of said section beginning with the words "Any member" and ending with the words "component county society" and enacting and inserting, in lieu thereof, the following

"Any member of any component medical society who shall have been disciplined or directed to suffer discipline in any degree by any final decision of his county medical society and who shall have exhausted his right of appeal, if any, with any such county medical society, feeling aggrieved by the decision of such society, may appeal to the Board of Censors of this Society from the decision of such component medical society by filing a notice of appeal with the Secretary of this Society and with the Secretary of such component medical society within three months after such final decision by such component medical society "

Respectfully submitted,

LOUIS H BAUER, M.D., *Speaker*
PETER IRVING, M D, *Secretary*

Report of the First District Branch

To the House of Delegates, Gentlemen

The annual meeting of the First District Branch was held at St Luke's Hospital and at the Woman's Hospital, in New York City, on October 9, 1940

Following the custom of the past few years, the program was arranged by the staffs of the two hospitals, beginning at 8 00 A.M. and continuing until 5 30 P.M. There were clinics, demonstrations, and lectures covering practically every field of medicine, affording the men in the district a complete "refresher session" in whatever department of medicine they desired

The attendance was the best for several years, which we believe indicates that this is the type of meeting that the men prefer

All credit for the arrangement and execution of the program should be given to Dr Edward J Donovan and Dr Albert H Aldridge.

We wish to extend our appreciation to them and to the superintendent of St Luke's Hospital for the delightful luncheon

Immediately after luncheon, Dr James M Flynn, president of the State Society, made a short and forceful address, which was well received. Following this, election of officers was held, and the following men were elected president, Dr Alexander N Selman, Spring Valley, first vice-president, Dr Morris R Bradner, Warwick, second vice-president, Dr

James G Morrissey, Yonkers, secretary, Dr Isidore J Landsman, Bronx, treasurer, Dr Aaron Sobel, Poughkeepsie

Respectfully submitted,
THEODORE WEST, M D, *President*

December 23, 1940

Report of the Second District Branch

To the House of Delegates, Gentlemen

The annual meeting of the Second District Branch was held at Mitchel Field, Garden City, through the courtesy of the commanding officer of that station on November 13, 1940. The scientific program was devoted to military medicine

The program was as follows—Morning Session "Plans of the Medical Profession for National Preparedness and Mobilization," Dr Samuel J Kopetzky, chairman, Council Committee on Medical Preparedness, Medical Society of the State of New York, "General Principles of Medico-Military Care and Evacuation," Colonel Julius Blank, M C U S A. Headquarters, 2nd Corps Area, "Plastic Surgery in Connection with General Medical Work," Dr Clarence R. Straatsma, past-president, Society of Plastic and Reconstructive Surgery. At the afternoon session the following talks were given "The Treatment of Head Injuries," Lieutenant-Colonel M F DuFrenne, M C, U S A., post surgeon, Fort Jay, New York,

tory Aids in the Early Diagnosis of Communicable Disease," Dr A. H. Harris, Jr., Albany, "Cancer," prepared by the Metropolitan Life Insurance Company

In addition to these exhibits there was a trip to the Physiological Field Station of Cornell University, where Dr Howard Liddell described the technic and demonstrated the mechanical devices used in the study of the neurotic animal

The 1941 meeting of the Sixth District Branch will be held in Cooperstown on September 18

Respectfully submitted,

G M MACKENZIE, M D, *President*

February 15, 1941

Report of the Seventh District Branch

To the House of Delegates, Gentlemen

The thirty-fourth annual meeting of the Seventh District Branch of the Medical Society of the State of New York was held at the Clifton Springs Sanitarium, Clifton Springs, September 26, 1940

The meeting began at 10 00 A.M., with sound motion pictures, of the historical type, devoted to episodes of medical interest Dr James M Flynn, president of the Medical Society of the State of New York, then spoke briefly, as did Dr Joseph S Lawrence, the state executive officer This was followed by the scientific program "The Recognition and Prevention of the Late Toxemias of Pregnancy in Their Incipient Stages," by Dr Herbert F Dyer, of Hamilton, Ontario—discussion by Dr James K Quigley, of Rochester, Dr Thomas W Maloney, of Geneva, and Dr A. B. Chidester of Auburn

After a bountiful dinner served in the main dining hall of the sanitarium, the afternoon session began with a paper by Dr Elmer Milch, of Buffalo, on the "Treatment of General Peritonitis Following Ruptured Appendix." This paper was discussed by Dr Lynn Rumbold, of Rochester, Dr Alfred K Bates, of Auburn, and Dr H J Knickerbocker, of Geneva

During the afternoon, Dr Benjamin J Slater, of Rochester, showed a movie travelogue, "A Trip to the Mediterranean," from films taken by himself These color films were shown as an entertainment for the ladies and were much appreciated.

The meeting closed with a medical "Correct or Incorrect" Contest, conducted by Dr Floyd S Winslow, of Rochester, with two teams of six doctors each. The sanitarium team won the contest, which was interesting and amusing to the 250 doctors in attendance

Respectfully submitted,

FREDERICK W LESTER, M D, *President*

February 4, 1941

Report of the Eighth District Branch

To the House of Delegates, Gentlemen

A very interesting and varied program was given at the annual meeting of the Eight District Branch held at the Hotel Niagara, Niagara Falls, Thursday, October 3, 1940 The morning session began at 9 30 with the showing of motion pictures, which included the following subjects "Occiput Posterior," Dr Arthur H Bill, "Varicose Veins Their Treatment by the Modern Combined Ligation and Injection Treatment," Dr H O McPheeters, "Cardiac Irregularities," Dr Carl J Wiggers Following these, Dr N Stanley Lincoln, Superintendent of the Mount Morris Tuberculosis Hospital, discussed "The Diagnosis and Management of Early Pulmonary Tuberculosis," emphasizing many points in his paper by the use of lantern slides

Dr W P Van Wagenen, associate professor of neurosurgery, University of Rochester School of Medicine, Rochester then gave a very interesting paper on "The Rationale of Common Procedures Used in the Care of Head Injuries"

Luncheon was served in the main ballroom, at which time Dr James M Flynn, president of the Medical Society of the State of New York, spoke briefly on "Problems Confronting the Medical Profession Today"

The afternoon program was opened with a paper, "Problems in the Care of the Premature Infant," by Dr Julius H Hess, professor of pediatrics, and head of that department at the University of Illinois College of Medicine, Chicago

The remaining portion of the program was devoted to a "Round Table Discussion on Therapy," conducted by Dr A. H. Aaron, Buffalo, and assisted by Drs F D Leopold, Frank Meyers, W J Orr, W J Rose, L M Siegel, and L Maxwell Lockie Numerous questions were received from the audience and a lively discussion of many subjects resulted from them

In addition to the scientific program presented for the members of the Eight District, an entertainment program for the wives of those attending the session was provided The Woman's Auxiliary of the Erie County Medical Society was host at a luncheon in the main dining room of the hotel Following the luncheon, moving pictures were presented by Mrs Edward G Winkler, a member of the Auxiliary Bridge, and a sightseeing trip around the Falls, were included for the visiting fair sex.

The entire program was well attended, there being almost two hundred present for the scientific program, in addition to another one hundred of the auxiliary and guests

Respectfully submitted,

LEON J LEAHY, M D, *President*

February 9, 1941

Warriner Woodruff, Saranac Lake, second vice-president, Dr Harold A Peck, Glens Falls, secretary, Dr John E Free, Ogdensburg, treasurer, Dr F Leslie Sullivan, Scotia

The officers and visiting members of the Fourth District Branch were guests of the Schenectady County Medical Society at a dinner held in the evening at the Hotel Van Curler

President S C Clemans presided and addresses were given by the state president, Dr James M Flynn, who spoke on the need for membership in the State Society and what the Society has to offer its members Dr Samuel J Kopetzky, president-elect, spoke on the organization for Medical Military Service

Entertainment was furnished by an orchestra composed of members of the Schenectady County Society, who rendered both vocal and instrumental solos as well as orchestral numbers

The Woman's Auxiliary of Schenectady entertained the ladies from the other counties of the district in the afternoon and also as their guests at the dinner in the evening

The second scientific session began at 9 30 A M on Wednesday, October 2, at which time the following papers were presented and received a great deal of instructive discussion "Pentothal Sodium in General Surgery," by Dr Edward S McDowell, Plattsburg—collaborators Dr William W Johnson and Dr William H Ladue, Plattsburg, "Medical Care of the Indigent Sick," by Dr Louis H Bauer, Hempstead, "Treatment of Unusual Fractures," Lantern Slide Demonstration by Dr Frederick F McGauley, Schenectady

This branch meeting was successful in having a large attendance from the various counties comprising the branch and its officers are indebted to the officers and members of the Schenectady County Medical Society in arranging and taking care of the annual meeting so well.

Respectfully submitted,
S C CLEMANS, M D, President

January 20, 1941

Report of the Fifth District Branch

To the House of Delegates, Gentlemen

The thirty-fourth annual meeting of the Fifth District Branch was held in the Hotel Snyder, Little Falls, on September 24, 1940 Seventy members and guests were present The following program was presented "Newer Concepts of Hypertension," by Dr Harry Dan Vickers, Little Falls—discussion opened by Dr Wardner P Ayer, Syracuse, "Diagnosis of Carcinoma of the Lung," by Dr George G Ornstein, New York—discussion opened by William C Jensen, superintendent of Broadacres, Oneida County Sanatorium, Utica, "Appendicitis in Children," by Dr Brewster C Doust, professor of pediatrics, Syracuse University—discussion opened by Dr Frederick S Wetherell, Syracuse, Symposium on "General and Local Cryotherapy," by Dr John C A Gerster, Cornell University Medical College, New York—Dr Gerster gave a very interesting paper on the subject as to history, technic, indications and contraindications, and the results obtained, "Chemotherapy

in General Practice," by Dr Henry van Zile Hyde, Syracuse—Dr Hyde gave a very complete review on sulfanilamide, sulfapyridine, and sulfathiazole

All the papers evoked considerable discussion by the men present

At the dinner Dr James M Flynn as state president gave a very interesting talk on medical ethics

The Woman's Auxiliary of the Herkimer County Society entertained the visiting ladies with a luncheon at the Beechnut Hotel in Canajoharie, and a trip through the Beechnut Packing Company plant in Canajoharie

Respectfully submitted,

FRED C SABIN, M D, President

February 10, 1941

Report of the Sixth District Branch

To the House of Delegates, Gentlemen

The thirty-fourth annual meeting of the Sixth District Branch of the Medical Society of the State of New York was held in Willard Straight Hall at Cornell University, Ithaca, New York, on Thursday, September 19, 1940 For the meeting 172 registered.

The members of the Sixth District Branch are greatly indebted to the Tompkins County Medical Society for providing luncheon, and to Professor Norman S Moore of the Department of Hygiene of Cornell for making such excellent arrangements for the meeting The program was as follows—Morning Session "Recent Progress in Thoracic Surgery," by Dr J Maxwell Chamberlain, Homer Folks Hospital, Oneonta—discussion by Dr R J Erickson, Albany, associate professor of medicine, Albany Medical College, "The Clinical Use of Ovarian Sex Hormones," Dr Benjamin P Watson, New York, professor of obstetrics and gynecology, Columbia University College of Physicians and Surgeons—discussion by Dr Claude E Chapin, Cortland, "The Clinical Use of Sulfonamide Drugs," Dr Colin M MacLeod, New York, Hospital of the Rockefeller Institute—discussion by Dr Norman S Moore, Ithaca.

At the afternoon session "The Psychoneuroses," Dr Thomas Rennie, Baltimore, associate in psychiatry, School of Medicine of the Johns Hopkins University—discussion by Dr Waldemar Boldt, Binghamton, "Sudden and Unexpected Deaths from Natural Causes," Dr Thomas A Gonzales, chief medical examiner of the City of New York—discussion by Dr Floyd S Winslow, Rochester

An innovation was introduced in the form of exhibits which were inspected by a large number of those who came to the meeting Among these were "The Diagnostic Value of Photographs of the Interior of the Eye," Dr Arthur J Bedell, Albany, "Salivary Reflexes in Students in the Civilian Pilot Training Corps at Cornell University," Richard Parmenter, Ph D, Ithaca, "The Influence of Diet on Aging Processes," Professor L A Maynard and Professor C M McCay, Ithaca, "Colored Reproductions of Normal and Pathologic Blood Cells," Dr William A Groat, Syracuse, "Certain Labor-

Scientific Program

The Committee Albert F R Andresen, M D , *Chairman*, Brooklyn,
A W Martin Marino, M D , Brooklyn, and
Chairmen of Sections and Sessions

GENERAL SESSIONS

(*Dr Andresen presiding*)

The presentations at these Sessions will consist of one-half hour lectures, without discussion. The meetings will start promptly at the hour specified. Members are requested to be in their seats at least five minutes in advance of the meeting time.

Meetings will be held by Daylight Saving Time

Tuesday, April 29—2 00 P M
Hotel Statler, Ballroom

SYMPOSIUM PSYCHOSOMATIC PROBLEMS

The effect of "mind over matter" has in recent years again assumed prominence in many fields of medicine, and the psychosomatic aspects of all kinds of diseases are once more being emphasized. General practitioner and specialist alike are becoming bewildered on considering the diversity of opinions in regard to this important subject. The speakers in this symposium have been devoting their time to intensive study of psychosomatic problems so that an authoritative review of the subject will be presented.

- 1 Cause and Motive in Health and Disease
Bernard Glueck, M.D., Ossining
- 2 The Importance of the Investigation of Personality Factors
Edwin J Doty, M.D., Assistant Attending Psychiatrist, Payne Whitney Psychiatric Clinic, New York Hospital, New York
- 3 Practical Aspects of Psychiatric Management
George Eaton Daniels, M.D., Clinical Professor of Psychiatry, College of Physicians and Surgeons, Columbia University, New York
- 4 Medicine and Mental Symptoms
(The A. Walter Suter Lecture. This will be the third lecture to be delivered under this lectureship fund.)
Foster Kennedy, M.D., Professor of Clinical Medicine (Neurology), Cornell University Medical College, New York

Thursday, May 1—2 00 P M
Hotel Statler, Ballroom

SYMPOSIUM TRAUMA—ITS EARLY TREATMENT

At any time any physician may be called upon to administer first aid in a major accident case. Incorrect early treatment may result in serious consequences. Knowing what to do, and especially what not to do, may often result in the saving of a life. Entirely aside from the important military aspects of this problem it will be of advantage to all practitioners of medicine to hear the speakers in this symposium present the latest authoritative views on the proper care of injuries to various vital regions of the body.

- 1 The Treatment of Head Injuries
Fred W Geib, M.D., Attending Neurosurgeon, Rochester General Hospital, Rochester
- 2 The Diagnosis and Treatment of Fractures of the Spine with and Without Spinal Cord Injury
E. Jefferson Browder, M.D., Clinical Professor of Surgery, and of Neurology and Psychiatry, Long Island College of Medicine, Brooklyn
- 3 The Treatment of Injuries to the Chest
Frank B Berry, M.D., Assistant Clinical Professor of Surgery, College of Physicians and Surgeons, Columbia University, New York
- 4 The Treatment of Injuries to the Abdomen
Fenwick Beekman, M.D., Clinical Professor of Surgery, New York University College of Medicine, New York

[Section and Session programs on following pages]

1941 Annual Meeting

Medical Society of the State of New York

April 28, 29, 30, May 1—Hotel Statler, Buffalo

All meetings will be held by Daylight Saving Time

House of Delegates

The regular Annual Meeting of the House of Delegates of the Medical Society of the State of New York will be called to order at 10 00 A M on Monday, April 28, in the Meeting Room on the Seventeenth Floor

LOUIS H BAUER, M D, *Speaker*

PETER IRVING, M D, *Secretary*

Annual Meeting

The Annual Meeting of the Medical Society of the State of New York will be held on Tuesday, April 29, at 7 00 P M, in the Ballroom

JAMES M FLYNN, M D, *President*

PETER IRVING, M D, *Secretary*

Registration

Registration will be held on the Seventeenth Floor—for delegates on Monday, April 28, after 9 00 A M, for members on Monday, Tuesday, Wednesday, and Thursday, April 28, 29, 30, May 1, from 9 00 A M to 6 00 P M

Exhibits

Scientific and Technical exhibits will be located in the Hotel

Scientific Motion Pictures will be shown

Scientific Sessions

General Sessions on Tuesday and Thursday afternoons Section and Session meetings will be held on Tuesday morning, Wednesday morning and afternoon, and Thursday morning

Section on Industrial Medicine and Surgery Luncheon

On Tuesday, April 29, the Section on Industrial Medicine and Surgery will hold a subscription luncheon Mr Henry D Sayer will speak on "A Review of Medical Practices Under the Compensation Law"

Workmen's Compensation Conference

Chairmen and members of Compensation Boards of the county societies and

others will assemble in the Iroquois Room at 2 00 P M for a conference meeting on problems in this field David J Kaliski, M D, Director of the Workmen's Compensation Bureau, will preside

135th Annual Meeting

Hotel Statler, Ballroom, Tuesday, April 29, 7 00 P M

Calling the Society to order by the President, James M Flynn, M D

Reading of the minutes of the 134th Annual Meeting by the Secretary, Peter Irving, M D

The Annual Banquet

The Annual Banquet will be held in the Ballroom on Tuesday, April 29, at 7 00 P M, guest speakers to be announced

Requests for tickets and reservations should be sent to Lester S Knapp, M D, *chairman*, Banquet Committee, Hotel Statler, Room 1810, Buffalo, or telephone, Cleveland 1810 Tickets \$5

Public Meeting

In the Ballroom will be held a meeting for the public at 8 30 P M on Wednesday, April 30 Cards of invitation (without cost) can be secured in advance by writing to A H Aaron, M D, *chairman*, Public Meeting Committee, Hotel Statler, Room 1810, Buffalo, by telephoning Cleveland 1810, or they can be obtained at the Registration Desk, Seventeenth Floor

Tumor Clinic Round Table Conference

In the Iroquois Room will be held a round-table conference at 8 00 P M on Wednesday, April 30, where the problems of Tumor Clinics will be discussed under the auspices of the Medical Society of the State of New York and the Division of Cancer Control of the New York State Department of Health

The Woman's Auxiliary

See page 773 for the program

Thursday, May 1—10 00 A.M.

Hotel Statler, Georgian Room

- 1 Intestinal Obstruction from the Practitioner's Viewpoint
W Osler Abbott, M.D., Philadelphia (By invitation)
Discussion Leon J Leahy, M D, Buffalo
- 2 Polyps of the Rectum and Colon—Their Etiology, Clinical Significance, and Treatment
John C M Brust, M D, Syracuse
Discussion Alfred M Buda, M D, Brooklyn
- 3 Multiple Polyposis (Adenomatosis) of the Colon
Descum C McKenney, M D, Buffalo
Discussion Harry Goldman, M.D., New York
- 4 Cryptitis—Perianal and Perirectal Infections
F Leslie Sullivan, M.D., Scotia
Discussion Harry C Guess, M D, Buffalo

SECTION OF INDUSTRIAL MEDICINE AND SURGERY

Chairman John J Wittmer, M D, New York
Secretary John L Norris, M D, Rochester

Tuesday, April 29—10:00 A.M.

Hotel Statler, Iroquois Room

- 1 Clinical Considerations of Poisonings by Some of the Chlorinated Hydrocarbons
Henry Field Smyth, M.D., Philadelphia (By invitation)
Discussion May R. Mayers, M D, New York (By invitation)
- 2 The Potential Hazards of Some of the Newer Solvents
William J McConnell, M D, New York (By invitation)
Discussion Leonard Greenburg, M D, New York
- 3 Solvent Exposures—Petroleum Distillates
A. L Brooks, M D, Detroit, Michigan (By invitation)
Discussion James H Sterner, M D, Rochester

Wednesday, April 30—2:00 P.M.

Hotel Statler, Iroquois Room

SYMPOSIUM INDUSTRIAL HEALTH

- 1 Periodical Examinations
McIver Woody, M.D., New York
- 2 New Medical Opportunities in National Defense Industries
Clarence D Selby, M.D., Detroit, Michigan (By invitation)
- 3 Industrial Health and the General Practitioner
Leverett D Bristol, M.D., New York
Discussion Irving Gray, M D, Brooklyn,
Russell C Kimball, M D, Brooklyn

SECTION ON MEDICINE

Chairman

Louis Faugeres Bishop, Jr, M D, New York

Secretary

Scott Lord Smith, M D, Poughkeepsie

Tuesday, April 29—10 00 A.M.

Hotel Statler, Ballroom

- 1 Treatment of Fibrositis
Charles LeRoy Steinberg, M.D., Rochester
Discussion Morris Ant, M D, Brooklyn
- 2 The Urinary Tract in Medical Practice
Clayton W Greene, M.D., Buffalo
Discussion Allister M McLellan, M D, New York
- 3 The Diagnosis of Upper Abdominal Conditions
Maximilian A Ramirez, M D, New York
Discussion Henry Craig Fleming, M D, New York
- 4 Chemotherapy of Infection of Nervous System
Willard B Weary, M D, Albany (By invitation)
John J A. Lyons, M D, Albany (By invitation)
Discussion Emanuel Appelbaum, M D, New York, H van Zile Hyde, M D, Syracuse

Wednesday, April 30—2 00 P.M.

Hotel Statler, Ballroom

Address Soldier's Heart

- Louis Faugeres Bishop, Jr, M D, New York
Discussion C Ward Crampton, M D, New York
- 1 Principles Underlying the Treatment and Management of Coronary Disease
Frederick A. Willius, M.D., Rochester, Minnesota (By invitation)
 - 2 Follow-Up Study of Coronary Occlusion Comparative Study of Various Function Tests
Arthur M Master, M D, New York
Simon Dack, M.D., New York
Harry L Jaffe, M D, New York
Discussion of Papers Louis H Bauer, M D, Hempstead, Roy M Colhe, M D, Schenectady

SECTION ON NEUROLOGY AND PSYCHIATRY

Chairman Wallace B Hamby, M D, Buffalo
Secretary John E Scarff, M D, New York

Wednesday, April 30—10 00 A.M.

Hotel Statler, Chinese Room

- 1 Abscess of the Brain—Medical Diagnostic Aspects
Gilbert M Beck, M D, Buffalo
Irving Hyman, M D, Buffalo
Discussion Joseph E J King, M D, New York

SECTIONS

All papers read before the Society by members become the property of the Society. The original copy of each paper shall be left with the secretary of the section.

Discussers should have their remarks typed and hand them to the secretary.

Time limits. Twenty minutes for each paper, five minutes for individual discussion.

Section meetings will begin promptly at the hour specified.

SECTION ON DERMATOLOGY AND SYPHILOLOGY

Chairman Herbert H. Bauckus, M.D., Buffalo
Secretary Eugene F. Traub, M.D., New York

Wednesday, April 30—10 00 A.M.

Hotel Statler, Room 302

1. Dalhbour's Water—Its Uses in Dermatology
Timothy J. Riordan, M.D., New York
Orlando Canizares, M.D., New York
George Edward Morris, M.D., New York
(By invitation)

Discussion Frank C. Combes, M.D., New York

2. Contact Dermatitis
Irving Swartz, M.D., Syracuse

Discussion W. Francis Hoover, M.D., Jamestown

3. Some Common Problems in the Management and Diagnosis of Contact Dermatitis

Albert R. McFarland, M.D., Rochester

Discussion Howard Fox, M.D., New York

4. Report of Subcommittee on Industrial Dermatoses

Eugene F. Traub, M.D., New York

5. Treatment of Epitheliomas by Modern X-Ray Technic

George Clinton Andrews, M.D., New York

Discussion Earl D. Osborne, M.D., Buffalo

Thursday, May 1—10 00 A.M.

Hotel Statler, Room 302

1. The Treatment of Hypertrichosis by Electrocoagulation

Charles Lerner, M.D., New York

Discussion Paul Gross, M.D., New York

2. The Acidity on the Surface of the Skin

Eugene Traugott Bernstein, M.D., New York

Franz Herrmann, M.D., New York (By invitation)

Discussion Herman Sharlit, M.D., New York

Aurotherapy in Lupus Erythematosus, A Study Based on a Further Experience of Fourteen Years

Paul E. Bechet, M.D., New York

Discussion Edward R. Maloney, M.D., New York

4. Intensive Dosage, The "New" Interest in Arsenotherapy of Early Syphilis

A. Benson Cannon, M.D., New York

Discussion Lopo DeMello, M.D., Buffalo

5. Treatment of Pyoderma by Intravenous Injections of a Mixture of Yatren and Pus Obtained from Local Lesions

L. J. Arnesson, M.D., Buffalo

Discussion Harold L. Walker, M.D., Elmira

SECTION ON GASTROENTEROLOGY AND PROCTOLOGY

Chairman John L. Kantor, M.D., New York
Vice-Chairman

A. W. Martin Marimo, M.D., Brooklyn

Secretary H. Walden Retan, M.D., Syracuse

Wednesday, April 30—10 00 A.M.

Hotel Statler, Georgian Room

Address Role of Gastroenterology in American Military Medicine

John L. Kantor, M.D., New York

SYMPOSIUM

FOOD-BORNE DISEASES OF THE GASTROINTESTINAL TRACT

1. Food Inspection
Orville E. McKim, D.V.M., Port Chester
(By invitation)

Discussion E. T. Faulder, D.V.M., Albany
(By invitation)

2. Epidemiology of Food-Borne Diseases of the Gastrointestinal Tract

James E. Perkins, M.D., Albany

Discussion Stanley W. Sayer, M.D., Gouverneur

3. Laboratory Aids in Diagnosis and Control of Enteric Diseases

Albert H. Harris, 2nd, M.D., Albany

Marion B. Coleman, B.S., Albany

Discussion Samuel Frant, M.D., New York

4. The Treatment of Food-Borne Diseases of the Gastrointestinal Tract

Zacharias Bercovitz, M.D., New York

Discussion Howard B. Shookhoff, M.D., New York

- 3 Industrial Otology in Caisson Workers
Ralph Almour, M.D., New York
Discussion James W Babcock, M D, New York
- 4 Treatment of Ethmoiditis
John R. Honiss, M.D., Rochester
Discussion Arthur Palmer, M.D., New York, Frederick J O'Connor, M D, Syracuse

SECTION ON ORTHOPEDIC SURGERY

Chairman Frank N Potts, M D, Buffalo
Secretary Donald E. McKenna, M D, Brooklyn

Wednesday, April 30—10 00 A.M.
Hotel Statler, Chinese Room

SYMPOSIUM SPASTIC PARALYSIS

- 1 The Cerebral Palsy Problem
Lyman C Duryea, M.D., New York (By invitation)
- 2 Neurologic Aspects of Spasticity and Athetosis
Tracy J Putnam, M D, New York
- 3 Differential Characteristics of Spasticity and Athetosis in Relation to Therapeutic Measures
Winthrop M. Phelps, M.D., Baltimore (By invitation)

Thursday, May 1—10 00 A.M.
Hotel Statler, Chinese Room

- 1 Fractures of the Radial Head and Neck
Henry P Lange, M D, Brooklyn
- 2 Results in Internal Fixation of Intracapsular Fractures of the Hip
William W Plummer, M.D., Buffalo
- 3 Injuries to Cervical Vertebrae
Barbara B Stimson, M.D., New York
- 4 The Treatment of Fracture of the Patella by Excision
Robert P Dobbie, M.D., Buffalo

SECTION ON PATHOLOGY AND CLINICAL PATHOLOGY

Chairman Ward J MacNeal, M D, New York
Vice-Chairman Herbert R. Brown, M D, Rochester
Secretary M J Fein, M.D., Brooklyn

Tuesday, April 29—9.30 A.M.
Hotel Statler, Room 310

- 1 The Serodiagnosis of Trichinosis by Means of Complement Fixation
Ernest Witebsky, M.D., Buffalo
- 2 The Volume of the Blood and Extracellular Fluid in Congestive Heart Failure
Nolan L Kaltreider, M.D., Rochester
George R. Meneely, M D, Rochester

- 3 Recent Developments in Bacteriophage
Ward J MacNeal, M D, New York
Discussion Arthur W Wright, M D, Albany
- 4 The Pathology of the Apocrine Sweat Glands in Dogs
Robert McClelland, D V M, Buffalo (By invitation)
Discussion Norman Elton, M D, Buffalo
- 5 Blood Supply Experimental Tumors
Stafford L. Warren, M.D., Rochester
- 6 Recent Advances in Bacillary Dysentery
Joseph Felson, M D, New York

Wednesday, April 30—2 00 P M
Hotel Statler, Room 310

- 1 Aplastic Anemia
Stuart L. Vaughan, M D, Buffalo
- 2 Adenocarcinoma of Cervix
Burton T. Simpson, M.D., Buffalo
Alphonse A. Thibaudeau, M.B., Buffalo (By invitation)
Eugene M. Burke, B S, Buffalo (By invitation)
- 3 Recent Developments in the Field of Laboratory Medicine
Ralph G Stillman, M.D., New York
Discussion Walter S Thomas, M D, Rochester
4. Experimental Acute Gastric Ulcer Produced in Animals by Exposure to Sulfur Dioxide Gas
Frederick R. Weedon, M.D., Jamestown
- 5 The Dissemination of Tubercle Bacilli from Fresh Autopsy Material
Ruell A. Sloan, M.D., Buffalo
Discussion David K. Miller, M D, Buffalo
- 6 Effect of Kidney Extract on the Cardiovascular and Renal Systems
Benjamin Jablons, M.D., New York
Discussion J Homer Cudmore, M D, New York

SECTION ON PEDIATRICS

Chairman Norman L Hawkins, M D, Watertown
Vice-Chairman Leshe O Ashton, M D, New York
Secretary William J Orr, M D, Buffalo

Wednesday, April 30—10 00 A.M.
Hotel Statler, Ballroom

- 1 The Use of Bovine Antitoxin for Prophylaxis of Tetanus
Jerome Glaser, M.D., Rochester
- 2 The Use of Vitamin K in Children
Samuel W Clausen, M.D., Rochester
- 3 Clinical Endocrinology in Children
Walter Timme, M.D., New York

- 2 Oxycephaly
Joseph E J King, M.D, New York
Discussion Fred W Geib, M D, Rochester
- 3 The Present Status of Surgical Procedures Directed Against Extrapyramidal Diseases
H Russell Meyers, M.D, Brooklyn
- 4 Nervous and Mental Diseases of Soldiers During Active Warfare
George A. Blakeslee, M.D, New York
Discussion R. Montfort Schley, M D, Buffalo

Thursday, May 1—10 00 A.M

Hotel Statler, Room 338

- 1 The Present Status of Vitamins in Nervous Health and Disease
Herman Wortis, M.D, New York
Norman Jolliffe, M D, New York
Discussion Noble R. Chambers, M D, Syracuse, Franklin C Southworth, M D, Buffalo
- 2 The Surgical Treatment of Epilepsy
William P Van Wagenen, M.D, Rochester
Discussion Eldridge H Campbell, M D, Albany
- 3 The Various Forms of Shock Therapy in Mental Disorders and Their Practical Importance
Lothar B Kalinowsky, M D, New York (By invitation)
Discussion S Eugene Barrera, M D, New York, and Ralph W Bohn, M D, Helmuth
- 4 An Evaluation of the Surgical Treatment of Hypertension
George J Heuer, M D, New York
Frank Glenn, M D, New York

SECTION ON OBSTETRICS AND GYNECOLOGY

Chairman Francis R. Irving, M D, Syracuse
Secretary Eliot Bishop, M D, Brooklyn

Tuesday, April 29—10 00 A.M

Hotel Statler, Chinese Room

- 1 Rectocele—A Consistent Lesion Frequently Overlooked in Standard Repairs
Joshua William Davies, M D, New York
Discussion Edward P McDonald, M D, Albany
- 2 Obstetrical Problems Arising from Excessive Size of the Infant
Karl M Wilson, M.D, Rochester
Discussion Francis C Goldsborough, M D, Buffalo, and Henry W Schoeneck, M D, Syracuse
- 3 The Present Status of Gynecological Hormone Therapy
Samuel H Geist, M D, New York
Udall J Salmon, M.D, New York
Discussion Nathan P Sears, M D, Syracuse

4. The Direct Supravescical Extraperitoneal Cesarean Section
Francis R. Irving, M.D, Syracuse
Raymond J Pieri, M.D, Syracuse
Discussion Edward G Waters, M.D, Jersey City, New Jersey (By invitation), and Henry T Burns, M D, New York

Wednesday, April 30—2 00 P M

Hotel Statler, Chinese Room

- 1 Pruritus Vulvae
James E King, M.D, Buffalo
Discussion J Craig Potter, M D, Rochester
- 2 Ovarian Malignancy—A Clinical and Pathological Evaluation
Andrew A. Marchetti, M.D, New York
Discussion Ward L Ekas, M D, Rochester, and Samuel A. Wolfe, M D, Brooklyn
- 3 Streptococcal Puerperal Infections
Fred L Adair, M.D, Chicago (By invitation)

SECTION ON OPHTHALMOLOGY AND OTOLARYNGOLOGY

Chairman Searle B Marlow, M D, Syracuse
Secretary C Stewart Nash, M D, Rochester

Wednesday, April 30—9 00 A.M

Hotel Statler, Iroquois Room

- Instruction Hour Tonometry
Jonas S Friedenwald, M.D, Baltimore (By invitation)
- 1 Ophthalmoscopic Findings Versus Sinusitis
Arthur J Bedell, M.D, Albany
Discussion John F Fairbairn, M D, Buffalo, David F Gillette, M D, Syracuse
 - 2 Subnormal Vision and Occupation Aptitude
Albert C Snell, M.D, Rochester
Discussion Walter S Atkinson, M D, Watertown, James I Farrell, M D, Utica
 - 3 The General Practitioner's Share in the Campaign for the Prevention of Blindness in Patients Suffering from Glaucoma
Mark J Schoenberg, M D, New York
Discussion William A Groat, M D, Syracuse, Harold H Joy, M D, Syracuse

Thursday, May 1—10 00 A.M

Hotel Statler, Iroquois Room

- 1 Relation of a Specialist to the General Hospital and Its Personnel
Frank M Sulzman, M D, Troy
Discussion Albert M Rooker, M D, Niagara Falls, William J Hicks, M D, Middletown
- 2 The Management of Cavernous Sinus Thrombosis
Gordon D Hoople, M.D, Syracuse
Iri H Blaisdell, M.D, Syracuse
Discussion Harry K Tebbutt, M D, Albany, Homer A Trotter, M D, Buffalo

- 2 Intravenous Anesthesia
Brian C. Sword, M.D., New York (By invitation)
Discussion Frederick C. Wilcox, Jr., M.D., Brooklyn
- 3 Continuous Spinal Anesthesia
G. Edgar Burford, M.D., New York
Discussion Virginia Apgar, M.D., New York

Wednesday, April 30—2:00 P.M.
Hotel Statler, Room 302

- 1 Water Balance
Lourdon C. Reid, M.D., New York (By invitation)
Discussion John Scudder, M.D., New York (By invitation)
- 2 Recent Advances in Therapeutic Nerve Block
Emery A. Rovenstone, M.D., New York
Discussion Paul W. Searles, M.D., Buffalo
- 3 Problems of Obstetrical Anesthesia in the Average Hospital
John A. Kaib, M.D., Endicott
Discussion Paul M. Wood, M.D., New York
- 4 Anoxia, with Special Reference to Aviation
Frederick A. D. Alexander, M.D., Albany
Discussion Clarence J. Durshodwe, M.D., Buffalo

Thursday, May 1—8:00 P.M.
Hotel Statler, Room 302

A Clinic on Subcutaneous Oxygen will be given by John H. Evans, M.D., and L. Maxwell Lockie, M.D., of Buffalo. Cases treated will be presented, and technic demonstrated.

SECTION ON SURGERY

Chairman Roderick V. Grace, M.D., New York
Secretary Alfred H. Noehren, M.D., Buffalo

Wednesday, April 30—10:00 A.M.
Hotel Statler, Meeting Room

- 1 Bleeding as a Late Sequela of Gastroenterostomy and Subtotal Gastrectomy of the Bilroth II Type for Duodenal Ulcer
Ralph Colp, M.D., New York
Sigmund Mage, M.D., New York
Discussion Henry N. Kenwell, M.D., Buffalo
- 2 The Use of Powdered Sulfanilamide Locally in the Treatment of Peritoneal Infections
R. Sterling Mueller, M.D., New York
James E. Thompson, M.D., New York
Discussion James C. Sullivan, M.D., Buffalo

- 3 The Preparation and Use of Desiccated Plasma by Mass Production Methods and Its Importance in Routine and Military Surgery
Joseph M. Hill, M.D., Dallas, Texas (By invitation)
Discussion Paul W. Searles, M.D., Buffalo

Thursday, May 1—10:00 A.M.
Hotel Statler, Meeting Room

SYMPOSIUM SURGICAL TREATMENT OF GOITER

- 1 Indications for Operation—How to Differentiate Toxic Goiter from Conditions Simulating It
George W. Cottis, M.D., Jamestown
- 2 The Use of Iodine in Preoperative and Postoperative Treatment
Thomas B. Jones, M.D., Rochester
- 3 Technic of Thyroidectomy
Frederick S. Wetherell, M.D., Syracuse
- 4 Many Stage Operation
Martin B. Tinker, M.D., Ithaca
Martin B. Tinker, Jr., M.D., Ithaca
- 5 Anesthesia in Goiter Surgery
Oscar H. Stover, M.D., Buffalo
- 6 Surgical Complications and Their Treatment
George E. Beilby, M.D., Albany
- 7 Exophthalmos—Modern Views on the Cause, Treatment, and Prognosis
Summation Donald Guthrie, M.D., Sayre, Pennsylvania (By invitation)

SECTION ON UROLOGY

Chairman Leo E. Gibson, M.D., Syracuse
Vice-Chairman Roy B. Henline, M.D., New York
Secretary J. Sidney Rutter, M.D., New York

Tuesday, April 29—10:00 A.M.
Hotel Statler, Room 338

SYMPOSIUM PYELONEPHRITIS

- 1 The Effectiveness of the Sulfonamides on the Bacteria Encountered in Infections of the Upper Urinary Tract
Roscoe C. Borst, M.D., Utica
- 2 Chronic Pyelonephritis, an Incurable Disease—Importance of Prevention
Reed M. Nesbit, M.D., Ann Arbor, Michigan (By invitation)
- 3 So-Called Pyelitis in Children
Edgar A. Slotkin, M.D., Buffalo
Discussion of Symposium Winfield W. Scott, M.D., Rochester, George E. Slotkin, M.D., Buffalo, Albert M. Crance, M.D., Geneva, and Francis N. Kimball, M.D., New York

- 4 The Practical Management of Infantile Eczema
Earl D. Osborne, M.D., Buffalo

Thursday, May 1—10 00 A.M.
Hotel Statler, Ballroom

- 1 The Part of the Private Pediatrician in School Health Program
William E. Ayling, M.D., Syracuse
- 2 The Feeding of the Newborn Infant
Charles Hendee Smith, M.D., New York
- 3 The Management of the Diabetic Child
Priscilla White, M.D., Boston, Massachusetts (By invitation)
- 4 The Management of Feet Deformities in the Newborn
Frederick R. Thompson, M.D., New York

SECTION ON PUBLIC HEALTH, HYGIENE AND SANITATION

Chairman Ray D. Champlin, M.D., Oneonta
Vice-Chairman Edward E. Gillick, M.D., Niagara Falls
Secretary Frank E. Coughlin, M.D., Albany

Tuesday, April 29—10 00 A.M.
Hotel Statler, Room 334

- 1 Restaurant Hygiene
Walter D. Tiedeman, Albany (By invitation)
Discussion Paul B. Brooks, M.D., Albany
- 2 A Rural Bedside Nursing Program
Donald R. Davidson, M.D., Hancock
Discussion Stanley W. Sayer, M.D., Gouverneur

SYMPOSIUM

HEALTH EDUCATION FOR YOUTH ORGANIZATIONS

- 1 A Health Program for Youth Organizations
J. G. Fred Hiss, M.D., Syracuse
- 2 A Demonstration of a County 4H Club Health Program
Evelyn F. H. Rogers, M.D., Oneonta
- 3 The Physician's Part in the Program
Thomas C. Monaco, M.D., Walton

Wednesday, April 30—2 00 P.M.
Hotel Statler, Room 334

SYMPOSIUM

MEDICAL PROBLEMS IN NATIONAL DEFENSE

- 1 From the Viewpoint of the Army Medical Officer
Col. Charles M. Walson, M.D., Governor's Island (By invitation)
- 2 From the Viewpoint of the National Health Service
Albert E. Russell, M.D., Governor's Island (By invitation)

- 3 From the Viewpoint of the State Health Department
V. A. Van Volkenburgh, M.D., Albany
- 4 From the Viewpoint of the Physician in Civil Life
John D. Naples, M.D., Buffalo

SECTION ON RADIOLOGY

Vice-Chairman

Chester O. Davison, M.D., Poughkeepsie
Secretary Foster C. Rulison, M.D., Syracuse

Wednesday, April 30—10 00 A.M.
Hotel Statler, Room 334

SYMPOSIUM

GASTROINTESTINAL ROENTGENOLOGY

- 1 An exposition of film-reading methods on selected and proved cases furnished by Roentgenologists throughout the state (Diagnosis to be withheld in each case from the leaders of the symposium until after analysis and opinion are given)
Paul C. Swenson, M.D., New York
E. Forrest Merrill, M.D., New York

Thursday, May 1—10 00 A.M.
Hotel Statler, Room 334

Address A Report of the Dutchess County Tumor Clinic

Chester O. Davison, M.D., Poughkeepsie

- 1 Peroral X-Radiation in the Treatment of Mouth Cancer
Hayes E. Martin, M.D., New York
Discussion Walter L. Mattick, M.D., Buffalo
- 2 Clinical—Physical Significance of Quality in Routine Tele-Radiation Therapy
Walter T. Murphy, M.D., Buffalo
Discussion Louis C. Kress, M.D., Albany

SECTION ON REGIONAL AND GENERAL ANESTHESIA

Chairman John H. Evans, M.D., Buffalo
Vice-Chairman John F. Kellogg, Jr., M.D., Rochester
Secretary Milton C. Peterson, M.D., New York

Tuesday, April 29—9 00 A.M.
Hotel Statler, Room 302

Address of Welcome Herbert A. Smith, M.D., Buffalo

Address Control of Pain and Discomfort by the Subcutaneous Injection of Oxygen
John H. Evans, M.D., Buffalo

- 1 Prevention of Explosions of Anesthetic Mixtures by the Addition of Helium
George J. Thomas, M.D., Pittsburgh (By invitation)

Scientific Exhibits

April 28, 29, 30, May 1, 1941

The Committee William A. Krieger, M D, *Chairman*, Poughkeepsie,
Alfred H. Noehren, M D, Buffalo, and Secretaries of Sections and Sessions

Hotel Statler, Buffalo

Lobby

Walter D. Tiedeman
Chief, Bureau of Milk Sanitation

EVOLUTION OF THE UTERINE DEFECT OF CLASSICAL CESAREAN SECTION AND IMMEDIATE RESULTS OF AN IMPROVED SUTURE TECHNIC Defects have been demonstrable in all uteri which have undergone section by the former multiple layer suture technic. These defects have been due to the creation of sinuses and fistulas of varying degree, attributable to the sloughing of muscle strangulated by sutures. Modification of the suture technic by the use of a single row of interrupted sutures placed only in the outer layer, with beveling of the wound edges, has resulted in a sharp reduction of morbidity in 50 cases.

5

SESSION ON PHYSICAL THERAPY

Chairman
Madge C L McGunness, M D, New York
Secretary Harold J Harris, M D, Westport

Tuesday, April 29—10 00 A M

Hotel Statler, Georgian Room

- 1 The Significance of Muscular Balance in Acute Disorders of Posture and Locomotion
Henry H Jordan, M.D, New York
- 2 Therapeutic Relaxation
Jerome Weiss, M D, Brooklyn
Hans J Behrend, M D, New York
Discussion of Papers 1 and 2 George G Martin, M D, Buffalo, Joseph A. E Syracuse, M D, Buffalo
- 3 Ultraviolet Irradiation of Autotransfused Blood in the Treatment of Acute Pyogenic Infections
George P Miley, M.D, Philadelphia (By invitation)
Discussion Elmer W Rebbeck, M D, Pittsburgh (By invitation)
4. The Role of Spas in Medical Preparedness
Walter S McClellan, M.D., Saratoga Springs
Discussion Allen W Holmes, M D, Penn Yan

ROUND TABLE CONFERENCE ON TUMOR CLINICS

Under the auspices of the Medical Society of the State of New York a meeting will be held in the Iroquois Room under the chairmanship of Louis C Kress, M.D, Director of the Division of Cancer Control, State Department of Health.

All those at present concerned with tumor clinics in the hospitals throughout the State, and others who may be interested, are invited to

attend this discussion period. The various problems that have arisen and others that may arise will be considered. It will greatly assist if those interested will send in by mail to Dr Kress, at the Division of Cancer Control, New York State Department of Health, 152 Washington Avenue, Albany, any questions that they would like to have discussed.

Dissection of a freshly enucleated eye in Locke's solution at body temperature, gross anatomy seen in passing

New York

A NEW TEST FOR PREGNANCY (The *Xenopus* "Frog" Test) The exhibit consists of an explanation and description of the *Xenopus* (frog)

test for pregnancy The method of urine extraction and the methods of injection of the *Xenopus* are gone into in detail. Actual demonstrations of the pregnancy test will be performed daily The positive and negative reactions will be differentiated clearly Although many new tests have been suggested in recent years as being superior to the A-Z test, none has been proved to be of much worth except this *Xenopus* test The *Xenopus* test for pregnancy is not only as accurate as the A-Z or Friedman test but is far superior in many instances, since it is rapid, economical, and simple to perform The extruded eggs are easily visualized in a positive reaction A positive reaction can be obtained in from six to eighteen hours

13 (Viewing Box 23)

Albert A. Cinelli, M D
Manhattan Eye, Ear and Throat Hospital
New York

PLASTIC SURGICAL PRINCIPLES IN EAR, NOSE, AND THROAT Exhibit will depict the basic principles involved in plastic surgery of otorhinolaryngology Diagrams, photographs before and after, transparencies, etc., will aid greatly in the demonstration

14

Walter S McClellan, M.D
Saratoga Springs Authority
Saratoga Springs

CLINICAL STUDIES WITH NATURALLY CARBONATED SALINE-ALKALINE MINERAL WATERS The charts illustrate studies of the influence of the carbon dioxide bath on the peripheral circulation, the effect of the ingestion of these waters on the pH of the urine, and the changes in hemoglobin and red cell count observed during the "cure" regimen

Technical Exhibits

Hotel Statler, Seventeenth Floor, April 28-May 1

THE dictum, "There is Nothing New Under the Sun," cannot be applied to the technical exhibits of the 1941 annual meeting. For, as you will see on the seventeenth floor of the Hotel Statler, there are new developments and products in many of the various fields. These merit your closest attention, for about none can you afford to be uninformed. Therefore, you are urged to set aside a definite time during the Buffalo meeting to inspect these displays.

Descriptions of the exhibits are listed below in alphabetical order. Necessarily brief, they give but a fraction of the information that you will get from a personal visit. The exhibits will be located near the Registration Desk where, of course, you will go upon arrival to receive your badge admitting you to all scientific sessions.

Abbott Laboratories, North Chicago (Booth 68), most heartily invite you to stop at their exhibit to discuss the newer specialties with Abbott-Trained Representatives in attendance. The wide assortment of newer products displayed merits your attention and study and your questions are solicited. Description of the items being shown is prohibited for lack of space, so—

passed quality Biolac, the distinctive new liquid infant food, Beta Lactose, Dryco, Klim, Merrell-Soule Products, and Irradiated Evaporated Milk.

American Hospital Supply Corporation, Chicago and New York (Booth 52), is displaying Plasma, its simple and inexpensive preparation, Baxter's Closed Technique for Indirect Transfusion, Sulphanilamide in Vacolters and many new, interesting specialties, designed and developed to save the time and care of busy administrators at its exhibit.

Burroughs Wellcome & Co (U S A.) Inc., New York (Booth 43), presents a representative group of fine chemicals and pharmaceutical preparations, together with new and important therapeutic agents of special interest to the medical profession.

Cambridge Instrument Company, Inc., New York (Booth 67), will feature as part of a complete exhibit of Cardiac Diagnostic instruments, the compact, lightweight, portable "Simpli-Trol" Electrocardiograph - Stethograph that produces electrocardiogram and stethogram separately or simultaneously. A new portable instrument (illustrated), which automatically indicates and records blood pressure continuously, will also be displayed.

W. A. Baum Co., Inc., New York (Booth 50), who have devoted twenty-five years exclusively to the origination and making of blood-pressure apparatus, will display their complete line of Baumanometers and Latex replacement parts. The new STANDBY, a practical floor model designed primarily for office work, will be featured. You are cordially invited to consult a Baum representative on your blood-pressure instrument problems.

The Coca-Cola Company, Atlanta (Booth 36), will serve ice-cold Coca-Cola to the delegates with its compliments.

J. Beeber & Co., New York (Booth 16)

The Borden Company, New York (Booth 2), invites you to visit their display to learn about Borden's new Prescription Product for vaginal therapy—Betanul Vaginal Capsules, whose four-point action helps restore normal vaginal defenses. Also exhibited are infant foods of unsur-

Davies, Rose & Company, Ltd., Boston (Booth 55), hope that you will visit their headquarters. The preparations that this firm is exhibiting have a worldwide reputation. Physiological or chemical tests are made to assure their standardization. Clinical experience vouches for their dependability. Mr. H. V. Orne, well known to many of the members, will be at the booth to welcome you.

F. A. Davis Company, Philadelphia (Booth 65), suggests that you spend your spare time at their exhibit where you may examine without interference such outstanding new publications.

as *Medical Diagnosis and Symptomatology*—Loewenberg, *The Diagnosis and Treatment of Cardiovascular Disease*—Stroud, *Clinical Tuberculosis*—Goldberg, *The Cyclopedia of Medicine, Surgery, and Specialties, Clinical Endocrinology, and others*

R. B Davis Company, Hoboken, New Jersey (Booth 62), invites you to enjoy a drink of delicious Cocomalt at their exhibit. Cocomalt is refreshing, nourishing, and of the highest quality. It is fortified with Vitamins A, B₁, and D, Calcium, and Phosphorus to aid in the development of strong bones and sound teeth, Iron for blood, Protein for strength and muscle, Carbohydrate for energy.

The Denver Chemical Mfg Co, New York (Booth 85), will exhibit Antiphlogistine. This is employed by physicians in all parts of the world. Galatest, the new micro-reagent for the instantaneous detection of urine sugar, will be demonstrated. Be sure to see this demonstration.

Doak Company, Inc., Cleveland (Booth 80), pioneers in colloidal chemistry, are exhibiting the original colloidal Sulfur Diasporal as reported by Sullivan, Argy, Wheeldon, Senturia, Woldenberg, and others for treatment of chronic arthritis. Information for determination of cystine sulphur furnished, together with necessary reprints. They are also showing a number of dermatological specialties.

The Doho Chemical Corporation, New York (Booth 39). Animated Pathological Ear Exhibit—the Auralgan Exhibit consists of a model of the human auricle four feet high together with a series of twenty-four three-dimensional ear drums, modeled under the supervision of outstanding otologists. Each of these drums depicts a different pathological condition based upon actual case observation.

Duke Laboratories, Inc., Stamford, Conn (Booth 46), will demonstrate the original American-made, stretchable, adhesive-surfaced bandage, Elastoplast, suggested whenever compression and support are required. Samples of Medi-plast, the Elastoplast speed compress and Elastoplast Occlusive Dressings, used in the treatment of minor injuries, may be had, also samples of Nivea and Basis Soap—the prescriber's cosmetics.

E & J Resuscitator Company, Inc., New York (Booth 69)

J H Emerson Co, Cambridge, Mass. (Booth 8), will show the Emerson Resuscitator, Inhalator, and Aspirator—a single unit with three distinct functions involving no leather cups, pistons, or

oil, and the latest model Emerson Respirator with the new Orthopedic Attachment, designed for use with any model Emerson Respirator.

H G Fischer & Co, Chicago (Booth 7), are displaying their 1941 models of x-ray and short-wave apparatus which are so distinctive, both in improved performance and, in various instances, greatly lowered in price, that every physician should consider inspection a convention obligation. The complete H G Fischer & Co line includes shockproof x-ray apparatus, short wave units, combination cabinets, galvanic and wave generators, ultraviolet and infrared lamps and many other units, accessories, and supplies.

C B Fleet Co, Inc., Lynchburg, Va (Booth 63). Phospho-Soda (Fleet) is a highly concentrated and purified, aqueous solution of sodium phosphates. It is nontoxic, rapid but mild in action without irritation of the gastric or intestinal mucosa. Indicated for hepatic dysfunction, and for its thorough eliminating and cleansing action on the upper and lower gut.

The Foregger Co Inc., New York (Booth 20), is featuring anesthesia apparatus of new and distinctive design, resuscitation apparatus, and oxygen therapy equipment. The new O.F. type anesthesia apparatus is even more rugged and durable than previous models, simpler to operate and maintain, with finer regulation, improved visibility, and increased safety.

General Electric X-Ray Corp, Chicago (Booths 44 and 45)

Gerber Products Company, Fremont, Mich (Booth 19), have added several new varieties to both Gerber's Strained and Junior Foods and will display them at their exhibit. They invite examination of the booklets for mothers and of the professional literature.

Harold Surgical Corp, Albany and New York (Booth 34), will exhibit a complete line of short-wave apparatus of the latest design, electrocardiographic apparatus, Basal Metabolism Machine, and a new combination X-Ray Unit. A trained technician will be available at all times to explain the apparatus and this firm will also exhibit a number of new surgical and medical supplies which will be of interest to the profession. The Albany office will be represented by Mr H H Kestenbaum, and Mr Sam Mehlinger will be in attendance from the New York office.

H J Heinz Co, Pittsburgh (Booth 14), appreciates the confidence which the members of the Medical Society of the State of New York have expressed in their recommendation of Heinz

Strained and Junior Foods for infant feeding and special diets. Some of these foods are on display at their exhibit as well as various literature—newest of which is the Nutritional Chart, 9th edition, and Nutritional Observatory. Miss Alice Yakulis and Mr. H. N. Harris are at your service and will welcome members and friends at the exhibit.

Holland - Rantos Company, Inc., New York (Booth 35), will graphically illustrate with a motion picture modern contraceptive technique and will demonstrate at their display all the various contraceptive materials including both the Koromex and Hyva diaphragms, Koromex and H-R Emulsion jelly, together with the most complete line of contraceptive specialties.

Horlick's Malted Milk Corporation, Racine, Wis. (Booth 48), invites you to visit their exhibit of Horlick's, the Original Malted Milk, powder and tablets. Horlick's is a distinctive natural food combination containing the basic nutritive principles of full-cream milk and malted grain. Its ease of digestion, freedom from fiber and roughage, together with its rich calcium and phosphorus content, particularly recommend it to the physician.

Hyson, Westcott & Dunning, Inc., Baltimore (Booth 33), will exhibit Mercurochrome which is prominent among their products to be displayed and is now in the twenty-first year of its acceptance by the Council on Pharmacy and Chemistry of the American Medical Association. Thantiss Lozenges, Cobra Venom Solution, and Lutein Solution Ampules will also be shown, in addition to the diagnostic solutions and apparatus supplied by the manufacturers. The clinical effectiveness of Lutein Solution, an aqueous extract of corpus luteum, in the treatment of many menopausal disturbances and its effectiveness in obstetrical complications will be illustrated by especially prepared diagrams. Visiting delegates are invited.

Jeffrey-Fell Company, Buffalo (Booths 82, 83 and 84). Purveyors to the medical, hospital and nurses profession for more than half a century will display and demonstrate rare and select surgical and scientific instruments, drugs and sundries, known to modern science, representing the products of the most representative manufacturers in the United States and abroad. They specialize in the distribution of the products of Wilmot Castle Co., Rochester, N. Y., sterilizing equipment for office and hospital, Burdick Corp., Milton, Wis., complete physiotherapy equipment, Wiesner-Rapp Co., Inc., Buffalo, modern aluminum iron lung, Jones Metabolism Equipment Co., Chicago, simplified scientific metabolism equipment, and Gomco

Surgical Mfg. Corp., Buffalo, scientific instruments and apparatus.

You are cordially invited to visit their store at 1700 Main St., Buffalo. Telephone Garfield 1700.

"The 'Junket' Folks," Chr. Hansen's Laboratory, Inc., Little Falls, New York (Booth 17), serve rennet-custards made with either "Junket" Rennet Tablets or "Junket" Rennet Powder. There is also a display of "Junket" Brand Food Products. Enlarged photographs show how the rennet enzyme in rennet-custards transforms milk into softer, finer curds. Rennet-custards are widely recommended for infants, children, convalescents, postoperative cases and as a delicious, healthful dessert for the whole family. Fully informed attendants on duty.

Kalak Water Co. of New York, Inc., New York (Booth 58). If you are interested in inhibiting the distressing side effects associated with the administration of sulfonamides, salicylates, iodides, arsenicals, etc., drop around to the Kalak Water Co.'s exhibit. While enjoying a refreshing drink of this crystal-clear, sparkling water, ask the representative how Kalak Water may be employed to buffer the untoward effects of these drugs.

The Kelley-Koett Mfg. Co., Inc., Covington, Ky. (Booths 3, 4, and 5).

Kellogg Company, Battle Creek, Mich. (Booth 9). Kellogg's ready-to-eat cereals have an important part in the dietary program. Corn Flakes and Rice Krispies are included freely in wheat-free and low residue diets. Pep has been enriched with vitamins B₁ and D. Kellogg's other whole wheat and bran cereals—Wheat Krispies, Krumbles, Shredded Wheat, All-Bran and Bran Flakes—are rich in minerals and vitamin B, too. Reprints covering recent research with bran and nutrition leaflets are available at their exhibit.

Laboratory Natuelle, New York (Booth 73), will exhibit Digitaline Cristallisee Natuelle, a purified principle of digitalis purpurea. In attendance will be a representative qualified to discuss the pharmacological and clinical studies recently conducted and published surrounding Digitaline Cristallisee Natuelle. The purified principles of digitalis are attracting much attention. They will consider it a privilege to discuss the properties of this purified principle with you.

Lea & Febiger, Philadelphia (Booth 54), will exhibit among their new works Kraines' *Neuroses and Psychoses*, Portis on *The Digestive System*, Dennie and Pakula on *Congenital Syphilis*, Lewin on *The Foot and Ankle*, Rony on *Obesity and Leanness*, Packard, Hayes, and Blanchet on *Artificial Pneumothorax*, and Adair's *Obstetrics and Gynecology*. New editions will be shown of Boyd's *Pathology of Internal Diseases*, Craig and Faust's

Parasitology, Stimson on the *Common Contagious Diseases*, Haden's *Hematology*, Cushny's *Pharmacology*, Fishberg on *Heart Failure*, Joslin's *Treatment of Diabetes Mellitus*, and Peter on *Extra-ocular Muscles*

Lederle Laboratories, Inc., New York (Booth 53), are featuring their Hay Fever Products and the Tuberculin Patch Test (Vollmer) Lederle, Vi-Ferrin, Tetanus Toxoid, the new improved Staphylococcus Toxoid Digest-Modified, Bellabulgara, and Vitamin B Complex. Another feature of the Lederle display will be a large transparency showing their Research and Production Laboratories at Pearl River from the air, with a description of the various units. Regular Lederle staff attendants will be on hand for discussion with the doctors.

Lehn & Fink Products Corporation, Bloomfield, New Jersey (Booth 70). Amphyl display shows by means of excellent laboratory photographs that this antiseptic and germicide is noninjurious, nonspecific, and economical. Look at those graphic real-life photographs and charts. One of their outstanding chemists will answer all your queries at the exhibit.

Lepel High Frequency Laboratories, Inc., New York (Booth 18), will have on display their latest models of short-wave, ultraviolet, and galvanic sinusoidal apparatus. You are cordially invited to visit this display and see the latest in physical-therapy equipment. Questions on technical problems will be cheerfully answered.

Libby, McNeill & Libby, Chicago (Booth 27)

The Liebel-Flarsheim Co., Cincinnati, Ohio (Booth 51), will exhibit a line of short-wave generators as well as the famous Bovie Electro - Surgical Units, and other new and useful electromedical apparatus. A cordial invitation is extended to you to stop at this display and have the equipment demonstrated to you.

Eli Lilly and Company, Indianapolis, Ind (Booth 60), will demonstrate the germicidal efficacy of "Merthiolate" (Sodium Ethyl Mercuri Thiosalicylate, Lilly) and the compatibility of the antiseptic with body cells and fluids. Other new and useful products will be featured.

J B Lippincott Company, Philadelphia (Booth 23), will have on display Kugelmass' *Newer Nutrition in Pediatric Practice* and Becker and Obermayer's *Modern Dermatology and Syphilology*, as well as *Functional Disorders of the Foot* by Dickson and Diveley which has already gone into a second printing. Leaman's brand new

book, *Management of the Cardiac Patient*, will also be displayed. Other interesting works include Thorek's *Modern Surgical Technique*, Ragler's *Outline of Roentgen Diagnosis*, Bar-borka's *Treatment by Diet*, and many others.

Loeser Laboratory, Incorporated, New York (Booth 87), display their line of Loeser Intravenous and Intramuscular Solutions and Organotherapeutic Products. We cordially invite the physicians to visit our booth.

T H McKenna, Inc., New York (Booth 77), will show the new and more important books of all American publishers, as well as many new British books. You are invited to compare the leading books available on each subject and make your OWN selection. Avail yourself of our temporary Buffalo branch.

Mead Johnson & Company, Evansville (Booths 25 and 26), will exhibit several new products in addition to Dextri-Maltose, Pabulum, and Oleum Percomorphum. They will also have on display various examples of the slogan "Servamus Fidem"—We Are Keeping the Faith.

The Medical Film Guild (Booth 78), specialists in the production and distribution of "Medical Films That Teach" will exhibit a large variety of new original clinical and diagnostic films with emphasis on gynecology, ear, nose, throat, and respiratory diseases. Mr J P Hackel will be glad to answer your photographic questions.

The C V Mosby Company, St Louis, Mo (Booth 31). Doctors attending the convention are cordially invited to visit their exhibit to inspect the new publications which will be on display. Outstanding new volumes on surgery, dermatology, heart diseases, x-ray, obstetrics, and gynecology, and practice of medicine will be shown. Browse through this new material at their display.

Mutual Pharmacal Company, Inc., Syracuse, New York (Booth 6), will exhibit special tablet products such as Liv-Ferrin, Vita-Lav-Ferrin, Ferrous Sulfate with Vitamins, Vitamin D Capsules, ABCDG Capsules, Eluxr and tablets of Thiamin Chloride, Ascorbic Acid, Nicotinic Acid, and other products of special interest.

Nutrition Research Laboratories, Chicago (Booth 30), will show by means of illuminated x-ray and lifelike plaster casts of actual case histories the successful results obtained from ERTRON therapy in the treatment of arthritis. Also featured will be BEZON, a Natural High Potency Vitamin B Complex.

Paine Hall School, New York (Booth 86)

Make it a point to stop in and clear up questions on Medical Assistants' their worth, salaries,

Paine Hall

TECHNICAL EXHIBITS

771

and hours. You will learn our students are trained in Laboratory Technique, Doctor's Office Practice, Medical Secretarial, X-Ray, First Aid, Medical Nomenclature, and Professional English. Obtain authentic information from trained directors

Parke, Davis & Company, Detroit, Mich (Booth 76), will feature in their exhibit the sex hormones, Theelin and Theelol, antisyphilitic agents, such as Mapharsen and Thio-Bismol, posterior lobe preparations, including Pituitrin, Pitocin, and Pitressin, and various Adrenalin Chloride Preparations

Pet Milk Sales Corporation, St Louis, Mo (Booths 71 and 72), will display an actual working model of a milk condensing plant in miniature. This exhibit offers an opportunity to obtain information about the protection of Infant feeding and its uses in Miniature Pet Milk cans will be given to each physician who visits the Pet Milk display

Petrolagar Laboratories, Inc., Chicago (Booth 28), offer, in addition to samples of the Five Types of Petrolagar, an interesting selection of descriptive literature and anatomical charts Ask the Petrolagar representative to show you the HABIT TIME booklet. It is a welcome aid for teaching bowel regularity to your patients

Philip Morris & Co, Ltd., Inc., New York (Booth 59), will demonstrate the method by which it was found that Philip Morris Cigarettes, in which diethylene glycol is used as the hygroscopic agent, are less irritating than other cigarettes. Their representatives will be happy to discuss researches on this subject and problems on the physiological effects of smoking

Picker X-Ray Corp, Buffalo and New York (Booth 13)

The Radium Emanation Corporation, New York (Booth 75), will exhibit a wide variety of instruments and applicators used in modern radium therapy, including permanent and removable composite, leakproof Radon Seeds. The advantages of these seeds will be demonstrated by magnified sections showing their constructions in detail.

Ralston Purina Company, Inc., St Louis, Mo (Booth 66), invites physicians to register at their exhibit for Low Calorie and Allergy Diets, wheat, egg and milk-free food lists, recipes and food diaries, Laboratory Reports on whole grains as a natural source of vitamins and minerals, samples of Ralston Ry-Krisp, the whole rye wafer

Riedel-de Haen, Inc., New York (Booth 12), will feature their pioneer bile acid preparations. Competent representatives will gladly discuss the latest findings on Decholin and Decholin sodium, Degalol, Cholmodin and other Riedel-de Haen products. Physicians are requested to register for their free copy of the third edition of the brochure, *Biliary Tract Disturbances*

Ritter Equipment Company, Inc., Rochester, New York (Booths 40 and 41), is a newcomer to the state exhibit this year. They introduced to the medical profession last summer an entirely new line of medical equipment, designed for both the specialist and the general practitioner. Included in their display will be Ear, Nose, and Throat Units, Chairs, Fluorescent Lights, Stools, Surgical Cuspidors, Sterilizers, Compressors, and Bone Surgery Engine. Picture shows the Ritter ENT Unit

S. M. A. Corporation, Chicago (Booth 42), has an interesting new display which represents their selection of infant feeding and vitamin products. Physicians who visit this exhibit may obtain complete information as well as samples of S. M. A. Powder and the special milk preparations—Protein S. M. A. (Acidulated), Alerdex and Hypo-Allergic Milk

Sanborn Company, Cambridge, Mass (Booth 74), is featuring the New Sanborn Cardiette with "Instomatic" Operation and a Double Check on "timing" Accuracy, the Stetho-CARDIETTE for simultaneous heart sound and electrocardiogram recording, the CARDIO-SCOPE for visual electrocardiography, and the 1941 WATERLESS Metabolism Tester offering improvements in convenience, in portability and in patient comfort through easier breathing

Sandoz Chemical Works, Inc., New York (Booth 64), are featuring Gynergen—(ergotamine tartrate) for the dramatic relief of migraine as well as dependable uterine hemostasis, Digiland—crystallized initial glycosides of Digitalis lanata, gravimetrically and biologically standardized, Calgluon and Neo-Calgluon for oral and parenteral calcium therapy, Bellergal, Bellandanol, and Bellafoline—sedatives of the neurovegetative system, Calcibronat—laren—cardiodiuretic principles of squill, Scil-gun—a stable preparation of pure ergonovine tartrate, Neo-Gynergen—a balanced combination of ergotamine and ergonovine for obstetric and gynecologic use

W B Saunders Company, Philadelphia, and London, Eng (Booth 1), will have on display their complete line of books of interest to physicians and specialists. Of particular interest are Graybiel & White's *Electrocardiography in Practice* the new Griffith & Mitchell's *Pediatrics*, Krusen's new *Physical Medicine*, Novak's

Obstetrical and Gynecological Pathology, Walters & Snell's *The Gallbladder and Its Diseases*, advance sheets of the new (1941) Mayo Clinic Volume, Pelouze's *Office Urology*, the current series of the Medical Clinics of North America and of the Surgical Clinics of North America with their Symposia on common, everyday diseases and conditions, the new Cecil's *Medicine*, new Ewing's *Neoplastic Diseases*, Wilder's *Clinical Diabetes*, and a number of other important new books and new editions

Schering Corporation, Bloomfield, New Jersey (Booth 15) Their exhibit actually displays the entire group of highly advanced Schering hormone preparations (including Oretone-M, the new orally effective tablets for male hormone therapy), distinguished for their potency, absolute purity, and economy in actual practice. Members of the Medical Research Division are present to discuss endocrine or other problems. Attending representatives: Dr. Max Gilbert, Mr. N. P. Lombardi, Mr. Charles H. Witters, and Mr. F. O. Robbins.

Sharp & Dohme, Inc., Philadelphia (Booths 10 and 11), will feature in their new, modern and striking display "Delvinal" Sodium, "Lyovac" Bee Venom Solution, and other "Lyovac" biologicals. There will also be exhibited a group of new biological and pharmaceutical specialties prepared by this house, such as "Propadrine" Hydrochloride products, "Rabellon," "Padrophyl," "Riona," "Depropanex," and "Ribothron." Capable, well-informed representatives will be on hand to welcome all visitors and furnish information on Sharp & Dohme products.

Smith, Kline & French Laboratories, Philadelphia (Booth 47), will display their medical specialties at their exhibit. Messrs. H. O. Walton and A. B. Howe will be on hand to answer questions and furnish any information regarding the products that the physician may desire.

E. R. Squibb & Sons, New York (Booth 32), will feature a number of new and interesting Vitamin, Glandular, Biological and Chemotherapeutic specialties at their exhibit. Well-informed Squibb Representatives will be on hand to welcome you and to furnish any information desired on the products displayed.

R. J. Strassenburgh Co., Rochester, New York (Booth 29) Research is the life of the modern pharmaceutical industry. Because of its constant research, the R. J. Strassenburgh Company has progressed steadily for over fifty-five years—its contributions and service to the medical profession are responsible for its high standing. Visit their exhibit and see the latest developments in Strassenburgh Pharmaceuticals.

The Wander Company, Chicago (Booth 24) During the convention when you feel tired and

"let down" have a refreshing cup of Ovaltine at The Wander Company exhibit. Ovaltine is a food supplement enriched in vitamin and mineral content. Feel free to visit the Ovaltine booth often.

Westwood Pharmacal Corp., Buffalo, New York (Booths 56 and 57)

White Laboratories, Inc., Newark, New Jersey (Booth 21), will present White's Cod Liver Oil Concentrate Liquid, Tablet and Capsule (and White's Thiamin Chloride Tablets)—all Council-Accepted. Well-trained, courteous representatives will be in attendance to discuss the practical advantages provided by Cod Liver Oil Concentrate as an economical and convenient measure of Vitamins A and D prophylaxis and therapy. Pertinent information concerning our new knowledge of the vitamins and vitamin deficiency states, together with literature descriptive of the clinical merit of the products of White Laboratories, will be offered for the registrant's consideration.

Wilmot Castle Company, Rochester, New York (Booth 81) Safe Lighting and Sterilizing. The Castle Exhibit will show what's new in lighting and sterilizing equipment for the Physician's office. One item will be an examining light that is suitable in price for the physician, and yet has a host of the qualities of a big hospital light. Then, there will be the famous CAST IN BRONZE "Full-Automatic" sterilizers and autoclaves. These will be shown singly and recessed in cabinets.

Winthrop Chemical Company, Inc., New York (Booth 49), extends a cordial invitation to every member of the Medical Society of the State of New York to visit their exhibit where representatives will gladly discuss the latest preparations made available by this firm. Available to you are valuable booklets dealing with anesthetics, hypnotics, sedatives, antasyphilitics, diagnostics, diuretics, vasodilators, vitamins, anti-allergics, and others.

John Wyeth & Brother, Inc., Philadelphia (Booths 37 and 38), cordially invite you to visit their exhibit where the following pharmaceutical specialties will be displayed: Amphojel—Wyeth's Alumina Gel for the management of hyperacidity and peptic ulcer, A.B.M.C. Ointment—for the relief of Arthritic pain, Bepron—Wyeth's Beef Liver with Iron for the nutritional anemias, Bewon Elixir—a palatable appetite stimulant and vehicle, Duterra—Wyeth's vaginal lotion of Kaolin and Alumina, Kaomagma—Wyeth's magma of Alumina and Kaolin for the control of diarrhea and treatment of colitis, Silver Picrate—for the treatment of acute anterior urethritis and Trichomonas vaginalis.

The Zemmer Company Inc., Pittsburgh (Booth 22), extends a cordial invitation to every member of the Medical Society of the State of New York and guests to visit their exhibit where they will display a number of their leading pharmaceutical products.

Medical News

County News

Albany County

Dr Haven Emerson, of New York City, spoke on voluntary and compulsory health insurance on March 13 in Page Hall, Albany, under the auspices of the woman's auxiliary of the county society.

Medical societies and their auxiliaries from all parts of the Albany area were represented, including the county organizations in Schenectady, Schoharie, Rensselaer, Greene, Columbia, Saratoga, and Montgomery.

Broome County

Dr Louis C Kress addressed the county society on March 11 on "Cancer Its Prevention and Treatment."

The radio speakers on Thursday evenings in March were Miss Beatrice Ritter, who spoke on nursing, and Drs Carl Benson, Ralph Vincent, and W H Boldt.

Chautauqua County

The Jamestown Labor Legislative Conference voted on March 3 to submit a proposed medical service plan to the Jamestown Medical Society.

Erie County

Buffalo's pneumonia death rate has been better than divided in half in the last three years, due largely to use of chemotherapy, Dr Nelson W Stroh, president of the county society, said in a newspaper interview a few days ago.

He attributed the "wonderful results" in Buffalo's conquest of pneumonia to a great extent to the help many physicians received from the clinical and laboratory demonstrations of the use of serums and chemotherapy conducted here in 1939 by the county medical society in cooperation with the Edward J Meyer Memorial Hospital, State Health Department, and Medical Society of the State of New York.

The Women Physicians' League, the Councilors, and Dentists held a joint dinner meeting on March 3.

Dr Edward Clark, of Buffalo, who died on March 1, had practiced medicine for sixty years.

Nassau County

The Wagner state compulsory health insurance bill was opposed by the county society at its meeting in the Cathedral house, Garden City, on February 25, as reported in the *Nassau Renew Star*.

As a more effective plan, the society endorsed that of the Medical Expense Fund of New York, Inc., a nonprofit, medical expense indemnity insurance company authorized by the state legislature. The fund operates in similar fashion to the "three-cents-a-day" hospital plan.

The society contended that the compulsory measure would make it impossible to provide the medical care to which "persons in moderate

circumstances are entitled." Under the compulsory measure, all persons who earn up to \$25 weekly would have to purchase the insurance and would have to accept any physician sent to care for them, the society charged.

The plan of the medical expense fund, as outlined before the society by Dr Frederick E Elliott, of Brooklyn, head of the organization, would permit the subscriber to select his own physician from a list of co-operating doctors in the county.

Already more than 150 physicians in Nassau County have announced they would cooperate in the medical expense fund plan, J Louis Neff, executive secretary of the society, said.

Subscribers would be entitled to \$500 worth of medical care, including surgery, x-ray and other special services a year, Dr Elliott said.

More than 175 members of the society attended the session and saw a ten-minute motion picture. The members also heard a report of the legislative committee headed by Dr Eugene Coon, of Hempstead, and a report of the medical economics committee headed by Dr Stuart T Porter, of Floral Park.

New York County

The county society has condemned the bill in the State Legislature which proposes to amend the education law regarding the practice of chiropractic. It characterized the bill as a "menace" to the health of the people of this state, emphasizing that the training of chiropractors was "inadequate" to permit them to take care of the sick.

The Academy of Medicine met on March 8, with the following program:

"Current Concepts Regarding Benign Lesions of the Small Intestine" (a) Roentgenological aspects—Ross Golden, professor of radiology, College of Physicians and Surgeons, Columbia University, (b) Surgical aspects—Claude F Dixon, associate professor of surgery, Mayo Foundation, University of Minnesota, (c) Medical aspects—Burrill B Crohn, associate in medicine, Mount Sinai Hospital.

On March 11 there was a combined meeting of the Section of Neurology and Psychiatry of the New York Neurological Society. Papers of the evening were (a) "The Effect of Liver Therapy on the Pathways of the Spinal Cord in Subacute Combined Degeneration"—Charles Davidson, discussion—Lewis D Stevenson, (b) "The Psychopathology of Psychopathic Personality"—George S Sprague, discussion—Karl M Bowman and A A Brill, (c) "Ambulatory Schizophrenias"—Gregory Zilboorg, discussion—A A Brill. A general discussion followed.

The International Medical Club of New York met in cooperation with the French Medical Society, the Hispano-American Medical Society, the Hungarian-American Medical Association, the Italian Medical Society, the Rudolph Vir-

Preoperatively... and for Speedier Post-Surgical Come-Back

In the aim for a better nutritional state in the patient about to undergo surgery, New Improved Ovaltine can play a signal role. It contributes materially to the protein, carbohydrate, mineral, and vitamin intake, providing the elements which have been shown to reduce the hazards of anesthesia and surgery.

Postoperatively, Ovaltine supplies balanced caloric energy in easily digested, readily available form. Its palatable taste assures acceptance by the patient even when many other foods are refused, and its generous supply of vitamins and minerals makes for accelerated postsurgical comeback. Following abdominal surgery Ovaltine is especially valuable, its low curd tension encourages rapid gastric emptying, its complete digestibility and virtual freedom from fibrous resi-

due impose no undue burden upon the stomach and small bowel. Ovaltine is advantageously included in the postoperative diet as soon as liquids are tolerated.

The recommended three daily servings of New Improved Ovaltine, made according to directions, each with 8 oz. of milk*, provide in addition to proteins, fat, and carbohydrate, the following:

VITAMIN A	2578 I. U.
VITAMIN B ₁	302 I. U.
VITAMIN D	327 I. U.
VITAMIN G	491 Sherman-Bourquin units
CALCIUM	1.05 Gm.
PHOSPHORUS	0.903 Gm.
IRON	8.8 mg.
COPPER	0.75 mg.

(*Based on average reported values for milk)

NEW IMPROVED

Ovaltine

2 KINDS — PLAIN AND CHOCOLATE FLAVORED

Ovaltine now comes in 2 forms—plain, and sweet chocolate flavored. Serving for serving, they are virtually identical in nutritional value.

Physicians are invited to send for individual servings of New Improved Ovaltine. The Wander Company, 360 North Michigan Avenue, Chicago, Ill.

Say you saw it in the NEW YORK STATE JOURNAL OF MEDICINE

chow Medical Society, and the Russian Medical Society, at the New York Polyclinic Medical School and Hospital, on March 5. The topic and speaker were "Contributions of Foreign Graduates to American Medicine," by Dr Foster Kennedy, professor of neurology, Cornell University Medical School, with remarks by Dr Alfred M. Hellman, president, Medical Society of the County of New York.

The club will meet on April 21, at The New York Academy of Medicine, Host—The Rudolph Virchow Medical Society, and on May 16, at New Amsterdam Hospital, Host—The French Medical Society.

Dr Claude A. Burrett, president of the New York Medical College and Flower-Fifth Avenue Hospitals, died at the hospital on March 3 of a cerebral hemorrhage. He was 62.

Onondaga County

Dr Leon H. Cornwall, of New York City, addressed the county society on "Medical Science and Political Philosophy" in the Syracuse University College of Medicine on March 4.

Dr Edward S. Van Duyn, chairman of the Onondaga County Medical Preparedness Committee, discloses, as reported in Syracuse newspapers, that questioning of men rejected at the Syracuse draft induction station has revealed that 90 per cent of them refused to permit examining physicians to refer disabilities to health welfare organizations for rehabilitation.

"This is probably explained by the fear on the part of the man examined that it is purely an effort to make him fit to be drafted when he has just escaped," Dr Van Duyn said in an article in the monthly publication of the Onondaga Medical Society and the Syracuse Academy of Medicine.

Physicians on duty at the induction station decided to report remediable physical defects to welfare health authorities, but selective service headquarters reported that such information was confidential and could not be passed on by draft boards.

"In an effort to get some idea of how this (reference system) would work if carried out, some of the draft physicians were requested to ask men rejected if they would like to be referred for such rehabilitation," Dr Van Duyn explained.

The number of men questioned was small, but it was "surprising to learn" that more than 90 per cent refused, he said.

Continuing, the article pointed out that one reason for the occasional appearance at the induction station of a registrant wearing braces is that such a man's examination by doctors attached to his draft board is not required to be as thorough as the examination at the station.

Rensselaer County

Members of the county society were invited to attend the public meeting of the American Institute of Electrical Engineers in Union College Memorial Chapel at Schenectady on March 13. This was the fifteenth memorial of a series inaugurated in 1925 by the Schenectady section of the institute to perpetuate the memory of Dr Charles P. Steinmetz.

The lecturer was Dr Frank H. Lahey, head of the Lahey Clinic in Boston.

Dr James P. Marsh, of Troy, who died on February 23 at the age of 78, had practiced medicine and surgery from 1885 to 1923. He was one of the founders of the Samaritan Hospital in Troy.

Richmond County

The county society held its monthly meeting on February 19, after being postponed from February 12, 1941, because of the holiday.

During this meeting, the society duly elected Dr Edward Williamson Perkins and Dr Hubert D. Farrell new members of the society.

After the business meeting, the movie "Transverse Cervical Cesarean Section" was shown.

The following committees have been appointed: Coordinating Council—Drs H. A. Cochrane, H. Lynn Halbert, and G. W. McCormick; Economics Committee—Dr Charles Rieger, chairman, Drs C. Douglas Walsh, John K. Lucey, and Herman Friedel; Legislation Committee—Dr D. V. Datalano, chairman, Drs J. D'Agostino, A. S. Driscoll, and W. T. Heldmann; Nominating Committee—Dr F. Coonley, chairman, Drs L. Foote, C. D. Walsh, J. K. Lucey, and E. C. McCulloch; Workmen's Compensation Committee—Drs. Donald E. Law, John J. Goller, and Curtis J. Becker; Medical Advisory Committee for Home Relief—Dr C. E. Pearson; Associated Hospital Committee—Drs H. Lynn Halbert, H. A. Cochrane, and D. E. Law; Committee for Joint Meeting of Pharmacists and Physicians—Dr George Johnson; Medical Preparedness Committee—Dr A. S. Driscoll, chairman, Drs D. E. Law, C. Douglas Walsh, Herbert A. Cochrane, Enrico Soldini, Herman Friedel, and George W. McCormick.

Washington County

A combined meeting of the county society and the staff of the Mary McClellan Hospital was held at the hospital on January 16. An address on "Acute Cranio-cerebral Trauma," covering the usual type of injuries to the skull, brain, and adjacent tissues, with details of diagnosis and treatment, was given by Dr Francis A. Echlin, New York City, assistant visiting neurosurgeon of Bellevue Hospital.

A presentation of clinical cases was made by Dr L. Whittington Gorham, of Albany, and an explanation of the new welfare department regulations was given by Dr W. S. Bennett, medical supervisor.

Westchester County

Dr Philip M. Stimson, of New York City, addressed the county society on March 18 on "Acute Contagious Diseases of Childhood."

The county society will hold an informal stag dinner at a New York hotel in the late spring this year instead of the usual dinner following a golf tournament at one of the local country clubs. The date tentatively selected is May 24. There will be present a nationally known guest speaker. A committee of arrangements is being organized under the chairmanship of Dr Henry J. Vier, of White Plains.

BUFFALO MEETING

[Continued from page 778]

The New Rochelle Medical Society held a regular meeting on February 10, at the Wykagyl Country Club. After dinner Dr. Harry E. Ungerleider, of New York City, presented a paper on "Cardiac Arrhythmia."

The Yonkers Academy of Medicine held a regu-

lar meeting on February 19, at the Hudson River Country Club. The guest speaker was Dr. Ernst Boas, attending physician at Mount Sinai Hospital, whose subject was "Some Factors in the Production of Cardiac Infarction." Discussion was opened by Drs. William J. Vogeler and Herbert W. Schmitz, of Yonkers.

"Teaching Days"—Maternal Welfare

The Maternal Welfare Committee of the Medical Society of the State of New York announces Regional Maternal Welfare Teaching Days to be held in Syracuse on Thursday, April 3, and in Rochester on Wednesday, April 9.

The program at the *Syracuse Meeting* is as follows:

1 00 P M Syracuse University College of Medicine, 766 Irving Avenue. Edward C. Hughes, M D, Regional Chairman, Announcements, Glenn A. Wood, M D, Remarks, Herman G. Weiskotten, M D, Dean of the Syracuse University College of Medicine, Henry W. Schoeneck, M D, Chairman of the meeting. The scientific program:

"Demonstration of a Maternal Welfare Conference Procedure," Charles A. Gordon, M D, Brooklyn.

"Management of Occiput Posterior Positions," Merten C. Hatch, M D, Syracuse.

"Bleeding in the First Trimester of Pregnancy," J. Thornton Wallace, M D, Brooklyn.

"Management of the Early Toxemias and the Mild Late Toxemias of Pregnancy," Stuart B. Blakely, M D, Binghamton.

"Degenerative Changes of the Ovum in Early Pregnancy," Elliot Bishop, M D, Brooklyn. Demonstrations and Exhibits, Faculty Room, The College of Medicine.

7 00 P M Dinner Meeting, Roof Garden, Hotel Onondaga, Syracuse.

Speaker: William E. Studdiford, M D, New York City, Professor of Obstetrics and Gynecology, New York University College of Medicine.

Subject: "Chemotherapy of Postpartum and Postabortal Hemolytic Streptococcal Infections."

Demonstration of Color Movies in Teaching Obstetrics, Edward C. Hughes, M D, Syracuse, New York.

The program at the *Rochester Meeting* is as follows:

3 00 P M University of Rochester Medical School, 260 Crittenden Boulevard, Ward L. Ekas, M D, Regional Chairman.

"Blood Plasma, Transfusions, Etc"—Earle B. Mahoney, M D, Rochester.

"Analgesia"—James K. Quigley, M D, Rochester.

"Manikin, Treatment of Posterior Positions"—R. N. Ritchie, M D, Rochester.

"Episiotomy"—Shirley Snow, Jr., M D, Rochester.

"Emergencies of the Third Stage of Labor"—Karl M. Wilson, M D, Rochester.

"Breech Delivery"—J. B. Loder, M D, Rochester.

Demonstration Case Study.

8 45 P M Rochester Academy of Medicine, 1441 East Avenue, Rochester.

"Normal Labor, Sepsis, Intercurrent Diseases"—Ferdinand J. Schoeneck, M D, Syracuse, Associate Professor of Clinical Obstetrics, Syracuse University College of Medicine.

A subscription dinner (\$1.25) will be held at the University Club, 26 Broadway, at 6 30 P M. Dress—informal. Dinner reservations must be made by April 7 to:

Medical Society of the County of Monroe
1441 East Avenue
Rochester, New York
Tel. Stone 860

THE MATERNAL WELFARE COMMITTEE OF THE

The price of the dinner is \$2.00. No other fees will be charged. Dress—informal. For further information and reservations, address:

Smoothage

"An agent which supplies bulk within the bowel (bulk which is smooth, gently stimulating, non-irritating), an agent which re-educates the bowel to normal function and breaks the cycle of catharsis"

YOU, the physician, know the real value of Smoothage. You know that the mucosal lining of the intestinal tract is a delicate membrane—that stimulation of bowel activity must be gentle, based on the presence of smooth, bland bulk.

You can doubtless affirm, from first-hand experience, the folly of combating constipation with harsh cathartics and irritating roughage materials which so frequently aggravate the existing condition.

Proceeding from these facts, Searle Research has evolved an agent which actually supplies the bulk necessary to overcome sluggishness in the bowel—yet provides it in a form that is gentle, bland and soothing

to the irritated mucosa. The product—

METAMUCIL-2

Widely acclaimed in the management of constipation, Metamucil-2 mixes instantly with fluids, and is unusually pleasant to take. May we send you a sample for clinical trial?

York Orthopaedic Dispensary and Hospital Rights to two beds in the New York Eye and Ear Infirmary and one bed each in the Presbyterian Hospital and the New York Orthopaedic Dispensary and Hospital pass to St Bartholomew's Church

"The story of the Saratoga hospital beds" is told in *The Saratogian*. "A week ago," it relates, "*The Saratogian* printed a little notice that the hospital needed twenty modern beds, which would cost \$38 apiece. It suggested, since the hospital lacked the funds, that readers of the paper might find it possible to help

"Within a period of exactly seven days, individuals and organizations pledged all the money needed not only for the 20 beds but for two more than had been requested. Just for good measure these generous donors also gave \$46 additional, which will be used for children's cribs at the hospital. We all may be proud of this signal exhibition of civic spirit and liberality. We may be glad, too, that we live in the kind of a community, where, without tumult or shouting, such an incident can occur"

The London hospitals have now received much damage from air raids, but their work has gone on, says a London letter to the *J.A.M.A.* In a recent raid seven hospitals were damaged. These included a large general hospital and a hospital for women. Six wards of one hospital were wrecked when four bombs struck the building, causing the death from shock of some elderly patients. At another hospital two blocks were completely wrecked and four porters were buried in the ruins. One was quickly rescued, but the others were still trapped at the time of the report. Many hospitals have had their roofs ripped off, their windows shattered, and their walls reduced to a pile of rubble. One hospital endured four direct hits on four successive nights. But despite the worst the raiders can do, the hospitals carry on. Thus, at a well-known hospital the medical superintendent, the medical staff, the matron, and the nurses all showed unflinching bravery through a grueling seven-hour ordeal. Their calm comment when the "all clear" signal was given was "Well, we didn't lose a single patient"

Improvements

Architectural studies for the new cancer hospital and clinic to be constructed by New York City at 163rd Street and Fort Washington Avenue and to be known as the Nightingale Hospital are nearly complete, Mayor La Guardia announces. The building will be ready for public service under the direction of the Hospital Department late in 1942 or early in 1943, the Mayor said, and will cost about \$2,650,000.

The new institution will have 315 beds, and about 20 per cent of the structure will be devoted to laboratory space where original research will be conducted, in addition to the normal laboratory work of a modern hospital. There will also be an outpatient department.

A new building has been completed by The New York Hospital, Westchester Division, to care for 20 disturbed women patients. It is dedicated to the memory of Dr Charles H. Nichols, former superintendent, and is called the Nichols Memorial Cottage. The funds were given in part by his widow.

The 69-year-old West Side Hospital and Dispensary, in New York City, has been completely renovated at a cost of \$30,000, and was reopened on March 1.

Mount St Mary's Hospital at Niagara Falls has two new eight-bed children's wards.

A committee is looking into the possibilities of establishing a hospital in Sidney.

The Hepburn Hospital at Ogdensburg is to have a new operating room. Last year more than 1,500 operations were performed in the present operating theatre.

Enlargement of the Van Dugee Hospital at Gouverneur is planned.

A new four-story nurses' residence is in prospect for the Mercy Hospital at Watertown.

The Stevens Hospital at Granville has purchased the Sheldon estate and will enlarge the house to provide twenty-five additional beds for patients.

The new \$400,000 nurses' home at the Neponsit Beach Hospital has been completed and will be occupied this month.

Fox Memorial Hospital, Oneonta, has let contracts for alterations to increase its capacity to one hundred beds.

The Syracuse General Hospital has launched a drive for a notable enlargement. The campaign will raise funds to build two new wings to the present building, providing an additional sixty-five beds. It will provide a four-story nurses' home large enough for housing and teaching 74 student and graduate nurses.

Herkimer Memorial Hospital plans an extension to add twenty-three beds, nearly doubling its present capacity.

A movement has been launched at Saratoga

[Continued on page 786]

Chemotherapy of COMMON TYPES OF STREPTOCOCCUS INFECTION

• The remarkable achievements of antibacterial chemotherapy may be credited largely to the general practitioners of medicine, for by them are treated effectively most of the infections that are initially mild but potentially dangerous. These include septic sore throat, otitis media, sinusitis, postpartum infections, complications of trauma, erysipelas and urinary infections.

The treatment of most streptococcus infections in their early stages is relatively simple and assured, for satisfactory therapeutic response may usually be expected from properly graded doses of the sulfonamide compounds.

Well tolerated—by mouth and by injection

It has been repeatedly reported by American clinicians of wide experience that Neoprontosil is definitely less toxic than sulfamilamide. An additional practical advantage is that Neoprontosil may be administered not only orally but also parenterally in comparatively high concentrations.

Physicians are requested to write for a pamphlet presenting detailed discussions regarding the pharmacology, indications and side effects.

VITAMIN C DEFICIENCY IN FAILURE OF WOUNDS TO HEAL

Vitamin C deficiency may be a factor in the failure of some human wounds to heal, Drs Charles C Lund and John H Crandon, Boston, declare in the *Journal of the American Medical Association* for February 22 as a result of investigations in which one of them went on a scurvy-producing diet and subjected himself to experimental wounds

To carry out experiments on the development of human scurvy, which results from a deficiency of vitamin C in the normal person, one of the authors went on a scurvy-producing diet from October 19, 1939, until May 7, 1940

Three months after the diet was started an experimental wound was made on one side of the back of one of the authors. No difficulty in wound healing could be demonstrated in this experiment, they declare. Shortly after five months the first sign of scurvy developed, and, although there was slight lassitude and ease of fatigue in the fourth and fifth months, marked fatigability began only in the sixth month

At exactly six months a second incision was made in the corresponding position on the other side of the back. Considerable difficulty was encountered in suturing this experimental wound, a condition that had not been encountered in the first wound. However, it was finally sutured and seemed to heal

"The cutaneous (skin) sutures were removed on the sixth day and adhesive strips applied to protect the skin from tension," the authors say. "On the tenth day the wound was reopened, and as soon as the skin was divided it was found that the tissues under the skin had not healed at all and that the wound contained a firm dry blood clot."

The clot was scooped out, and the wound was then sutured and the physician given vitamin C by means of injection into the vein. This was repeated daily for the next ten days, and the wound healed promptly at this time. At the end of the second ten days another incision was made across the area of the healed wound that had been pulled apart during the previous operation. This revealed normal healing.

The two men declare that "at just what point between three and six months delayed healing begins we cannot say."

As a result of their observations the two men say that a careful study of the vitamin C status of all surgical patients is valuable

"COLD" PREPARATIONS TO BE ATTACKED

"On February 3, W G Campbell, commissioner of Food and Drugs of the Food and Drug Administration, notified all manufacturers of 'cold' preparations that henceforth this class of products will be included in the administration's program of operations," the *Journal of the American Medical Association* for February 22 says.

"The announcement pointed out that present-day medical opinion supports the view that there is no known substance or mixture of substances which can be relied on to prevent or cure colds, further, that surveys of products which now appear on the market show that many of them make claims that involve the treatment or prevention of colds which are not justified by the scientific facts, while others exaggerate the effects which the medications will have on the symptoms, and finally, now that section 201 (n) of the Food, Drug and Cosmetic Act is fully effective, in the opinion of the administration any reference to colds in the labeling of a drug should clearly indicate just what the effects of the medicine with respect to this disease condition will be and, if necessary to avoid misunderstanding, just what the limitations of the medication are. The commissioner bases this on the fact that section 201 (n) requires that the label reveal any facts that are material in the light of such affirmative representations as the label may make."

"By way of explanation, the notice includes a statement to the effect that, for various reasons, one of which has been lack of adequate facilities, the Food and Drug Administration has not in the past given attention to the large number of preparations sold for the treatment or prevention of colds or for the mitigation of the symptoms of this disease, but that henceforth this class of products will be included in the administration's program of operations. Recently the *Journal* called attention to the promotion of one line of these preparations in which it was suggested that the druggist prescribe such items for the treatment of the active cold. This illustrated the extent to which manufacturers of these preparations have gone in promoting them to the public. Now that the Food and Drug Administration has determined to review the claims made it will be exceedingly interesting to watch the changes which will take place in the claims which are made for many of these preparations."

More than three million men, women and children have died of tuberculosis in the United States during the last thirty years. Over two

million more, remarks the *Kentucky Health Bulletin*, would have died if the mortality rate of thirty years ago had continued to prevail

COMPARE...

COCOMALT with other food drinks *It is not a mechanical mixture* All ingredients are *malted together* just the vitamins being added under controlled conditions Precision manufacture plus uniformity is assured through regular biological tests Clinical work, also, is continuous

Physicians and Surgeons—Evidence of Malpractice

THE highest court of one of the western states a few months ago handed down a decision of interest which concerns the burden of proof required of a plaintiff to establish a malpractice action against a physician *

The case was one that was tried before the court and a jury, and at the close of all the testimony, although the sufficiency of the evidence was challenged by the defendant physician the case was submitted to the jury and a verdict was rendered in favor of the plaintiffs

The proof that forms the basis of the jury's findings, interpreted in the light favorable to the plaintiff, was substantially as follows

The principal plaintiff, Mrs C, became afflicted with infantile paralysis and was affected so that she practically lost the use of her body above the hips For about four weeks she received hospital care and then went home under the care of a Dr M He continued to have charge of her treatment for approximately a year and a half, and then she changed doctors and retained the services of Dr W, the defendant in the case

It seems that Dr M was a specialist in orthopedic surgery and that his treatment consisted of the application of heat and massage and later on of exercise of a limited sort By the end of a year and a half the function of the hands and forearms had improved considerably, but those muscles that raise the arms showed practically no improvement In order to utilize the hands, the patient found it necessary to rest her elbows on something or be assisted by another person She became dissatisfied with the care Dr M had rendered, apparently because the exercises he advised were tiring

At that stage of things Dr W was called in He also was an orthopedic surgeon of many years' experience When he agreed to treat the patient, he told her he would only take the case on condition that she would follow his instructions

Being of the opinion that Mrs C had been allowed too much use of her muscles, he advised the application of a cast to afford complete rest of the muscles so that their strength could be built up He placed her in a cast covering her body from her neck to her hips, and her arms down to and including part of her hands This cast was applied on July 7 and was removed about four months later on November 11

During the intervening period Dr W saw the patient a couple of times within the first few days after the cast was applied and then did not actually visit her again until the same day the cast was removed The cast during that time caused the patient no particular trouble until November 10, and on that day the patient's

husband told Dr W that the cast had become painful to Mrs C However, it seems that about the middle of September the doctor and Mr C had a discussion about obtaining a brace to be applied at the same time that the cast was to be removed in order to support the arms There was some difficulty between the husband and the bracer, and no brace was made available before the time the cast was actually removed

When the cast was removed, the patient's fingers and wrists were practically rigid, although there seemed to be a slight improvement in some of the shoulder muscles She was unable to do the things she had before the cast was applied Dr C advised physical therapy to restore flexibility to the wrists and fingers, and such treatments were administered by a Miss B, a physical therapist, for about four months Next, under an anesthetic an attempt was made to break down and manipulate the wrists and fingers More physical therapy followed At the time of the trial, about a year after the cast came off, heat and massage treatment was still being undergone However, there was little flexibility to the wrists and fingers

The plaintiff, Mrs C, and her husband, the co-plaintiff, failed upon the trial to put in any medical testimony The only physicians who testified were the defendant and an expert called by him Both testified that there had been no departure from proper practice and that the cast was on a proper period of time and caused no injury by being left on for so many weeks They testified that stiffness was to be expected in immobilized joints but that it would not be increased in degree after eight weeks—the period they stated to be essential to derive benefit from the use of a cast

The plaintiffs contended that although the original application of the cast was proper it was allowed to remain on the patient beyond eight weeks and, hence, too long and that defendant was negligent in not personally seeing the patient from July to November—with resulting injuries to plaintiff

As previously stated, with the proof as summarized, the jury brought in a verdict for the plaintiffs The Appellate Court, on the other hand, ordered the judgment reversed and the action dismissed on the grounds the plaintiffs had failed to establish their cause of action

In so ruling, the Appellate Court said in the opinion

"All that appears herein, briefly stated, is that at the time the cast was placed on her, respondent had certain use of her wrists and fingers, but very little use of her upper arms and shoulders, that respondent was properly treated by appellant, in an endeavor to restore some part of the normal use of the muscles of the upper arms and shoulders, and that a bad result followed

TO HELP EDUCATE THE AMERICAN PUBLIC *about* THE IMPORTANCE OF POSTURE TO HEALTH

*S. H. Camp & Company
announces 3rd Annual*

In announcing 1941 National Posture Week we do so with a genuine expression of appreciation to the medical profession, public health groups, schools, and colleges throughout the country whose support of this activity has helped to make it an educational event of importance. We are happy in the knowledge that with each succeeding year, National Posture Week has resulted in more women being made conscious of the relationship of posture to health, as well as the importance of seeking professional advice regarding the ills caused by poor posture.

This year, as in the past, National Posture Week will be given widespread publicity through magazines, newspapers, and radio. In addition, non-commercial literature will be distributed to schools and colleges as an extension of our Public Health Educational Activities.

Many of our dealers throughout the country will also cooperate to help awaken the consciousness of the masses to the importance of correct posture. As always, we will endeavor to adhere to the ethical practices which will merit your approval.

CAMP *Supports*
TRADE MARK

S. H. Camp & Company, Jackson, Michigan

[Continued from page 788]

A doctor is not to be charged with negligence because the result is not what is desired.

"In the instant case, we are of the opinion that negligence cannot be based merely upon the fact that, after the cast was removed there was stiffness in respondent's wrist and fingers. The medical testimony is all to the effect that stiffness is to be expected in a variable degree, and the testimony is that the condition of respondent's fingers and wrists after the removal of the cast was not unusual, except that they did not seem to respond to treatment as quickly as in some cases. Conceding that an unfortunate result followed the use of this cast, insofar as respondent's fingers and wrists are concerned, a doctor is not a guarantor, and the mere fact that a bad result may follow an operation is not of itself evidence of negligence."

The Court also said:

"There is no evidence here which tends to establish that appellant was negligent in leaving the cast on for the period he did, nor is there any testimony which tends to show that had appellant made an investigation at the end of the six or eight weeks' period, he would have found a condition to exist different from the condition shown to exist at the time the cast was removed. This being true, how can it be said that it is not negligence for a doctor to leave a cast on for eight weeks, but it is negligence to leave it on nine, ten, twelve or sixteen weeks, where it is not shown that any different condition would or did exist at the end of the sixteen weeks than was there at the end of eight weeks?"

"We are clearly of the opinion that the questions of whether or not the leaving of this cast on for the additional period of two months caused the injury complained of, or whether or not it is reasonable to infer that it did, are questions which can properly be determined only by medical experts, and are not questions which may be determined by circumstances such as appear in this case, and upon which respondent relies to prove negligence."

Absences of Physician upon Delivery

A YOUNG woman who was a month and a half pregnant consulted a physician who had attended her in connection with a previous confinement two years before. He made arrangements to care for her during pregnancy and to deliver her and instructed her to return to his office regularly for check-up. This she did until she was in the last month of pregnancy. Up until that time her condition had been normal

throughout. When the doctor saw her last, he told her to communicate immediately with him when she began to feel pain. Some three weeks thereafter, the doctor received an evening call to go to a remote part of the city in consultation with another doctor, and he did not return to his home or office until 2:00 A.M. Upon his arrival there, he was told by his wife that two telephone calls had been received from the home of this patient—one at 10:45 P.M. requesting him to attend her immediately as she was in active labor and the second about a half hour later stating another doctor had been called and the baby born.

A malpractice action was instituted against the doctor in which the plaintiff claimed that the defendant failed to attend her at delivery and during pregnancy as a result of which the baby died and the plaintiff suffered severe injuries. However, plaintiff never diligently prosecuted the action and as a result, sometime later, a motion was granted dismissing the action.

Treatment of Xanthelasma

A MARRIED woman, 37 years of age, was referred to a physician specializing in the care of diseases of the eye with a history of having suffered from xanthelasma for a number of years. It seems that the condition had been removed from her eyelids nine years before with an electric needle, six years before with a knife, and three years before with a scissors, but it had recurred following each of said procedures.

The doctor undertook to treat the condition by the use of applications of chromic acid, a slight reaction followed, but the xanthelasma improved considerably. The condition of the plaintiff was observed over a period of about six weeks. At the end of that time the condition treated had dried up completely, but a slight eversion of the left lower eyelid at the inner canthus had developed.

A malpractice action was later instituted against the doctor in which the claim was made that due to his negligent care of the case, she became unable to close her left eye because of a contracting scar in the lower lid with resulting squinting and irritation to that eye.

Upon the trial of the action before a Court and a jury, the plaintiff testified with respect to the treatment rendered by the defendant physician and claimed that it was followed by a reaction and injury. She, however, failed to introduce any expert testimony in support of her contentions that the defendant was negligent and failed to follow medical practices. At the conclusion of the testimony on behalf of the plaintiff, the complaint was dismissed.

MEMORIAL LECTURE—ACADEMY

Dr. C. A. Mills will deliver this memorial lecture on April 3, 1941, at 8:30 P.M. at the New York Academy of Medicine. Dr. Mills is professor of experimental medicine at the University of Cincinnati.

RAW MANNERS ARE NOT WELL DONE

"In no profession does culture count for so much as in medicine, and no man needs it more than the general practitioner."

—Quoted from
Sir William Osler

*Q But, doctor, is it all right to leave the peas I
don't eat in an open can?*

*A. From the standpoint of health, there is no
reason why peas, or any canned food, should
be put into another container (1)*

(1) For some obscure reason many members of the general public persist in believing that an open can is not a safe food container. The U. S. Department of Agriculture expressed itself on this fallacy in a press release of February 23, 1936, as follows:

“Thousands of housewives are firm in the faith that canned foods ought to be emptied as soon as the can is opened, or at least before the remainder of the food goes into the refrigerator. Whether in the original can or in another container, the principal precautions for keeping food are—Keep it cool and keep it covered.” *American Can Company, 230 Park Avenue, New York, N. Y.*

Woman's Auxiliary

To the Medical Society of the State of New York

Legislation and the Auxiliary

One of our most important functions as an Auxiliary to the Medical Society is our work in legislation. In my correspondence with county chairmen and in my personal contacts with auxiliaries to which I have spoken, I have stressed the importance of each legislative committee acting as a study group in order that the members may become familiar with the salient points of state and federal legislation of interest to the medical profession. Thus, the committee can digest and explain these measures to its auxiliary in the time allotted for legislation at each meeting. In our daily contacts with lay persons we have many opportunities to promote a more intelligent understanding of these bills. Their true meaning and the reasons for their introduction are often misunderstood by the general public. Without an interested and active committee it is, of course, impossible to carry on this function.

There is definitely a growing interest in legislation among the various auxiliaries. The natural reaction to this particular subject seems to be that it is technical and uninteresting, and why bother about it anyway? It is most gratifying to note the interest which is manifest once the measures are explained to members and their part in the work is made clear to them. Space does not permit any discussion of the current state and federal legislation. Your county chairman has outlines and explanations of these bills with which you should be familiar. I am constantly stressing the importance of a complete understanding of the forms of Socialized Medicine by every auxiliary member. At your disposal is an explanatory outline which your county chairman has on this subject. Tantamount to this are the discussions we hear concerning the rejections for Selective Service, and here is where we can assist in a large measure by our knowledge of the real reasons for the rejections and what lies behind them. An editorial in the *J. A. M. A.* for January 4, 1941, gives an excellent explanation. If each of us will turn her attention to these various phases of legislation we will soon see how really interesting it can be. Furthermore she will not need to ask why it is important

for us to understand legislation, or why we, as an Auxiliary, should consider legislation one of our most important functions.

Lois (Mrs. Albert) VANDER VEER, 2ND

County News

Onondaga The regular meeting was held in the Syracuse Memorial Hospital, March 4, Mrs. Edgar M. Neptune, presiding. There are 212 members in this Auxiliary with 65 members in attendance. Dr. Robert Ainslie, resident pathologist of Syracuse Memorial Hospital, addressed the group on "His Experiences in China." His talk proved very interesting. Following this address a skit representing "A Model Meeting" was portrayed, Mrs. Winthrop Pennock, acting as chairman. This comedy was most entertaining and amusing. Over \$2,500 worth of medical equipment and medicine were collected by the Public Relations Committee for the Bundles for Britain, Mrs. Nobel Chambers ably acting as chairman for this excellent endeavor. A report was received that this donation was the largest of its kind from any community in the county.

Oswego A dinner meeting took place February 12 at the Pontiac Hotel—twenty-one members present. Mrs. A. Vander Veer, 2nd, talked on medical legislation. The auxiliary is collecting instruments and vitamins for Britain. At the business session Mrs. G. A. Marsden, of Oswego, and Mrs. F. E. Fox, of Fulton, were elected delegates to the state convention.

Niagara Mrs. W. Roger Scott presided at a luncheon meeting in February. Donations of vitamin capsules were received. Mrs. C. Rennie, of Erie County, gave an informative talk on auxiliary work. Dr. Ernest Reiger spoke on medical legislation at the March session. Red Cross sewing and knitting directed by Mrs. G. W. Arthurs followed.

Rensselaer The executive board was entertained by Mrs. J. J. Ramey, president. The board voted to participate in the Troy Community Chest Drive. The March meeting was in cooperation with adjacent auxiliaries at the lecture by Dr. Haven Emerson.

ARMY COMMISSIONS FOR DOCTORS

The War Department has approved a plan whereby the Army will start utilizing the roster being prepared by the American Medical Association of civilian physicians who have agreed to accept commissions in the Army when needed for immediate active duty during a national emergency, the *Journal of the Association* for February 22 reports in announcing the issuance by the Adjutant General of instructions pertaining to the plan.

The instructions, which have been sent to the Surgeon General and to each corps area and department commander of the Army, point out

that the roster being prepared and to be maintained by the Association will have the physicians classified as to professional specialties and proficiency.

Under the plan, which the Adjutant General says will be placed in operation at such time as the War Department will direct, when no qualified Reserve Officer can be found for medical corps vacancies, recommendations to the corps area commander concerned will be obtained from the American Medical Association as to those physicians on the Association's roster who meet the desired qualifications.

ARGYROL

SAFE AND EFFECTIVE

**IN ANY
CONCENTRATION
ON ANY TISSUE**

50% SOLUTION AS BLAND AS 1%

TO DESTROY infectious organisms is a simple matter, but to accomplish this without injury to the delicate tissues in which they are imbedded and without toxicity is another problem entirely. It is because ARGYROL so adequately fulfills this requirement that, in 40 years of world-wide use, it has achieved a reputation as the ideal mucous membrane antiseptic. Various conditions call for dif-

ferent concentrations, but in all it is safe and effective. ARGYROL is not an oily base preparation, not a vasoconstrictor, not a mercurial; nor a harsh astringent. It has a superior clinical record to all other mild silver proteins and it is chemically and physically different—in colloidal dispersion, in Brownian movement, in pH, in pAg, and in chemical reactions. Insist on the ORIGINAL ARGYROL PACKAGE.

NO CILIARY INJURY—NO TISSUE IRRITATION:

It has repeatedly been pointed out that the "ciliary sweep" is a vital factor in throwing off upper respiratory infections. ARGYROL, despite its protective consistency, does not injure ciliary action. In addition to its adequate bactericidal effect, its mechanical action is detergent, demulcent, pus dislodging.

DECONGESTION WITHOUT VASOCONSTRICTION:

It is a common observation that the continued use of vasoconstrictors may lead to a sogginess, and loss of resiliency of the tissues. ARGYROL lessens turgescence and is inflammation-dispelling but it induces no powerful artificial vasoconstriction.

NO SYSTEMIC TOXICITY ARGYROL has been extensively employed in children and adults alike, but no case of systemic toxicity has ever been noted—and this despite the fact that it has been instilled into cavities as the sinuses, the bladder and the renal pelvis where it might be unsafe to employ some of the toxic metal solutions.

INSURE YOUR RESULTS SPECIFY THE

ORIGINAL ARGYROL PACKAGE

A friendly suggestion: Your "littlest" patients aren't the only ones, Doctor, who enjoy wholesome **CHEWING GU**

The enjoyment of delicious chewing gum is a real American custom—probably because chewing is such a basic, natural pleasure.

Enjoy chewing gum yourself. See how the chewing helps relieve tension by giving it a try during your busy days.

Have some gum in your pocket or bag and in the office. Your patients—children and adults—appreciate your friendliness when you offer them some. Try this for a month—you'll be pleased with the results.

National Association of Chewing Gum Manufacturers, Staten Island, New York

V 54

THE ADVANTAGE OF A DISADVANTAGE

WHAT the eye doesn't see the heart doesn't grieve over. "This is equally true of the ear," states Arthur Hedley in the *March Volla Review*, "for hearing nothing we remain unconcerned and undisturbed. My utter unconsciousness of the sound of enemy planes overhead saved me many a sleepless night in France."

This statement gives rise to the thought that the handicapped are not quite as bad off during air raids as to warrant the pity a normal being might feel for the deaf or the blind. The author of the quotation above discusses "sounds and shocks" endured by the hard of hearing in a blackout. Because the eyes which are such an asset in

daylight, are of little use in the dark, impairment of hearing does have its disadvantage for the deaf. Not hearing approaching footsteps, collisions are inevitable. Nor can they hear the sirens warning of approaching raiders.

So the hard of hearing stay indoors and avoid the risk those who can hear run when they go out to public places for entertainment. The normal persons generally run to the doors to look for the raiders thus exposing themselves to the risk of being hit by flying shrapnel. The hard of hearing folks stay indoors oblivious to it all and are in reality in less danger than others.

Care of the Sick

The work of Dr. Wilson G. Smillie¹ in his survey to secure the extensive cooperation of all those sufficiently concerned with medical matters to have *specific information* about them is an example of the newer and much more valuable kind of inquiry which we dare to hope will be extensively plagiarized in the future. Conspicuously lacking, apparently, in Monroe County is the dabbler complex so frequently observed among the welfare weevils, and the compulsion-diaeresis which seems to have liquefied the legislative cortex where medical matters are concerned. The monroviens believe with Montaigne in speaking the truth, not so much perhaps as they would, but as much as they dare, and they dare a little the more as they grow older, as Dr. Smillie's survey witnesses.

The factual data gathered in this report in 1930, 1935, and 1940 show that the existing facilities for the care of the sick exhibited certain definite trends:

A Increase in hospitalization cost due to increased demands for hospital bed care

B Increased cost of hospitalization because of better and more extensive service

C Change in type of care as the result of an increasing demand for hospitalization of chronic disease

This is the result of the gradual

aging of the population in general. D A large increase in hospital insurance

These are the facts in Monroe County. "The physician," says the Monroe County Medical Society in judging the adequacy of existing facilities there, "is the keystone of medical care, *he is medical care*, and the hospital facilities are the tools with which he must do his work. Who, then, should know better than the physician whether or not his tools are adequate? Who is a better judge of the defects of the equipment with which he must accomplish his tasks?"

Probably even the public which enjoys the adequacy of the existing facilities can answer that. As part of the survey an analysis of public opinion conducted by an expert in this kind of survey showed that the *inadequacies* which the public believed to exist agreed closely with the opinion of the physicians. These were: necessity for more low cost hospital beds for care of acute illness of private patients, better provision for psychiatric care in general hospitals and additional outpatient facilities in psychiatry, more beds for the chronically sick, especially for the arthritis and cardiac cases, and more facilities for the care of convalescents and also for mental and dental care.

In the survey this question was asked: "Has your family ever had any kind of difficulty in securing it when they needed medical, hospital or nursing care?"

¹ Smillie, Wilson G. A Survey of the Facilities for the Care of the Sick of Rochester, N. Y. conducted for the Community Chest, Inc. Jan., 1941

Ninety-two per cent replied they did not know of any family in Rochester that needed such care and was unable to get it. Thus do the monroviens strike a

powerful blow for truth and sanity in the matter of existing and needed facilities for the care of the sick. Albany papers please copy

Medicine and Military Needs

"Out of the selective service program, in itself a necessary and commendable means of national defense, has arisen a situation which imperils the health of the American people and the preparedness program as well," says Mr. J. O. Kelley, executive secretary of the Medical Society of Milwaukee County.¹ "The present defense crisis threatens to precipitate a wholesale conscription of medical students and interns for military training. Medicine is genuinely alarmed lest the medical resources of the nation be depleted to such an extent that both civilian and military populations will suffer approximately 3,500 of the 5,200 physicians graduated each year will qualify physically and will be needed to enter the services of the Army, Navy, and Public Health Service for a year's training."

The *Journal of the American Medical Association* in a leading editorial says

"At present, probably more than ever previously, a need for clear thinking on the subject of the supply of interns in relation to the demand by hospitals for their services is desirable. Some hospitals have been unable to secure any interns and others have not secured their usual number. The demand exceeds the supply. The size of senior classes in approved medical schools has remained almost constant since 1934, while the number of appointments available each year in approved hospitals has steadily increased. Although statistics are not yet available, the number of graduates of European schools seeking internships in this country has diminished greatly within the past year. While the number of interns recruited from this source has never been large, the recent decrease has served to accentuate the disproportion between supply and demand."

"The approved medical schools with their present facilities cannot increase the size of their classes without sacrificing accepted educational standards. Furthermore, the function of medical schools is to educate physicians to supply the medical needs of the country, not merely to develop young physicians to meet the demand of hospitals for low cost house staff personnel."

Until approved medical schools are able to train more students (assuming that more applicants could qualify for admission) the supply of prospective interns will not increase.

"Even the present flow of graduates from approved schools into internships may be reduced by the selective service act. The crucial needs of the preparation for national defense, especially the necessity of expanding the Army and Navy Medical Corps, will no doubt reduce still further the number of graduates available for hospital service beyond the first year of intern training. This will affect hospitals which have internships more than one year in length as well as those which have extended training services in the form of residencies."²

The drainage of competent intern material is already beginning to affect seriously the staff organization of many of the smaller hospitals. In addition, the call to active service of many reserve officers presently serving in key positions on the medical and surgical staffs of many hospitals, small and large, presents another threat to the proper organization of the medical administration of civilian hospitals.

The attitude of the Selective Service Administration toward any change in the basic law was voiced before the State Military Affairs Committee recently by Brig. Gen. Lewis B. Hershey, deputy director. He spoke in opposition to an amendment offered by Senator Murray of Montana to provide for deferment of medical students, interns and resident physicians and surgeons in hospitals until they shall have completed their studies. He advised that it would be the wiser course to permit local boards to make a final decision. Senator Murray in reply is reported to have said that many students and interns were so uncertain over the outlook that they were volunteering.

Major William J. Walsh, executive assistant director of the Selective Service

¹ Milwaukee Medical Times, 14, No. 3 (March) 1941

² J. A. M. A., 116, No. 11 (March 14) 1941

for New York City, said at Columbia University, March 18, 1941, that the Selective Service Act stipulates that college and university students may request deferment until the end of the academic year, or July 1, 1941, whichever is first. Senior law and medical students may, he said, obtain further deferment enabling men to take state bar or medical examinations before their induction for a year's military training.

In the interest of health and defense medicine is calling upon local draft boards for a clear and just interpretation of the rules of the Selective Service Act relating to medical students. The re-

sponsibility is definitely assigned the local boards under Section XVIII, Vol. III, of Selective Service Regulations. It should be the business of organized medicine to see to it in every way possible that local draft boards are informed of the seriousness of the medical student problem, the status of the intern and resident in the local hospital structure, and the importance of their roles in preserving a reasonable balance in the medical institutions of their communities. If local boards are to exercise reasonable judgment, they must be in possession of the facts upon which to make their decisions.

Attention, Parents!

Recently, the Municipal Civil Service Commission published a comprehensive study of the correlation of brains and brawn. In a group of 7,500 men those who rated lowest, physically, had virtually the same mental ability as those whose physical strength was rated "very superior." The study was based on the physical performance of four separate groups, of 100 men each, of the Department of Sanitation. These groups were so spaced that they covered the entire range of successful candidates. Group A contained the top men, Group B ranked near the 3,000 mark, Group C rated around 5,000, and Group D comprised the residuum at the bottom of the 7,500-man list.

Group	Physical Percentage	Mental Percentage
A	98	90
B	91	89
C	88	90
D	85	89

"It is altogether possible," the study says, "to have both brains and brawn. They are not mutually exclusive competency categories for brains are a-

likely to accompany a highly developed physique as weak and flabby muscles.' The tests not only required a written examination necessitating more than average intelligence to pass, but included as well the most rigorous test of physical strength.

Here is certainly factual evidence of a highly inconclusive nature from an unquestionably reliable source. It seems to indicate that if you have brains you can thumb your nose at the physical educators and let it go at that for your daily dozen. But it does not say that if you haven't brains you can't still be a Sandoz if you start early enough. On the other hand if you have brains you do not apparently interfere with their function if you fly a kite or jump over fences or run 120 yards with a fifty-pound dumbbell in each hand or dance the slip horn jive with a 150-pound dumbbell in one arm, or whatever.

The principal thing, as we see it, is to have the brains, granted those, you can be as flabby as an editorial writer or as physically powerful as a successful Department of Sanitation candidate and you will shine like a light, even "as a good deed in a naughty world."

Buffalo Beckons

Gateway to Canada—hydroelectric power capital of the world—leader of diversified industry—city of homes and beautiful trees—threshold of Niagara Falls—flour milling king—aircraft manufacturing center—convention city of the future—that's Buffalo, scene of the 135th annual convention of the Medical Society of the State of New York, April 28 to May 1

More than 2,000 delegates from all sections of this great Empire State are expected to pour into the Queen City of the Lakes at convention time, when the glories of spring will begin to spread themselves over the Niagara Frontier in a glorious welcome

Buffalo promises you a never-to-be-forgotten visit. Not too large, not too small, this city of good neighbors will give you more than mere convention sessions in a hotel. It will provide entertainment, recreation, and sight-seeing possibilities unequalled in the East.

The Queen City of the Lakes is getting herself all dressed up for the Medical Society conclave. Of course, one of the big drawing cards in the Niagara Frontier is that wonder of the world which never seems to lose its appeal—Niagara Falls. The roaring cataract still hammers out its mighty thunder on the jagged rocks hundreds of feet below as thousands of travelers from every corner of the globe look on in wonderment.

Those historic spots around the Falls on which have trod the feet of royalty from many lands are more beautiful than ever. Victoria Park—Goat Island—Honeymoon Lane—Cave of the Winds—the Rapids—all are within easy reach of convention delegates.

But you delegates won't have to hike down to Niagara Falls for beauty and attractions. Right in Buffalo, conventioners will find urban splendor at its peak. From hotel windows high above the street, delegates will be able to see Lake Erie, where it pours its waters into the mouth of mighty Niagara, and Canada just across the river.

Turning in another direction, one can see Downtown Buffalo in all its twentieth century progress. Skyscrapers reach to the heavens and rings of smoke curl from their lofty stacks. Down in the streets below, thousands of work-a-day folks go their respective ways.

And yet, turning only a trifle from this bustling scene of activity, the convention delegate can look northward along Delaware Avenue into one of the finest residential sections in the

country, just a few blocks away from the heart of the business area.

For those with an interest in industry and commerce, Buffalo's attractions are legion. There are the giant flour mills, largest in the world, miles of great steel plants that pour molten metal day and night to help build Uncle Sam's defenses, and great, sprawling aircraft factories where "wings of death" are produced in an unending stream.

Buffalo is the second largest railroad center in the country and great lines of laden cars move through the Niagara Frontier in a never-ending stream. Lake freighters make their way in and out of Buffalo harbor almost without interruption.

Buffalo's hotels, restaurants, smart shops, night clubs, theaters, and other places of entertainment are among the finest, and delegates are assured facilities for fun day and night.

Now that you have this mental picture of the 1941 convention city, it might be well to furnish delegates with some idea of the importance of Buffalo as a medical center. Far and wide this city is known for its many large and modern hospitals, spotted throughout the metropolitan area, serving thousands upon thousands of suffering humanity.

To describe adequately the features and activities of these numerous institutions would fill many volumes. But to furnish convention delegates with a thumb-nail sketch of these hospitals, some abbreviated data are here presented.

One of the largest hospitals in this area is the Buffalo General, located at 100 High Street. Delegates will find numerous attractions at this institution, including the blood bank, the blood plasma bank, shock room, oxygen therapy department, windowless air-conditioned surgeries, new urologic department, x-ray department, library, lunch room, and the new tumor clinic.

Buffalo General also is using the A & B factor with type O blood. This is a new discovery by the hospital's chemist and bacteriologist in which physicians should be extremely interested. It permits the hospital to use type O blood for transfusion of any patient with absolutely no reaction. Dr. Fraser D. Mooney is superintendent of this institution.

One of the finest municipal hospitals in the country is Buffalo's city hospital, known as the Edward J. Meyer Memorial Hospital, 41

[See page 890 for rates]

Grider Street It serves thousands of indigents in the Buffalo area During the past year, Meyer Memorial Hospital treated 11,243 patients with a total of 316,987 patient days

Its extensive diagnostic and treatment clinics, including branch dispensaries, had total visits of 145,596 during the past year Its vast dental clinics recorded a total of 39,198 visits

Operated as an adjunct to the city hospital is the Crippled Children's School, which is financed by the city and is located on the hospital grounds Hundreds of Buffalo's crippled children receive their grade-school education here Dr Walter S Goodale is superintendent of Edward J Meyer Memorial Hospital

Another important link in the chain of Buffalo hospitals is Emergency Hospital, 108 Pine Street, operated by the Sisters of Charity This institution has a capacity of 170 beds During 1940 it admitted 4,260 patients First aid is an important service of this institution, and, because of its downtown location, it receives a large percentage of accident victims

In 1940, Emergency Hospital rendered first aid to 7,644 patients Visits to the outpatient department totaled 17,401 Two ambulances with attending medical service are operated day and night This institution boasts the latest modern equipment and puts special emphasis on quick and efficient service for all medical and surgical emergencies

Another large and important Buffalo hospital is Millard Fillmore, 875 Lafayette Avenue Scrutiny of the annual report of this institution shows that 7,756 patients were admitted during the past year Births totaled 1,866 Millard Fillmore has earned a wide reputation for its childbirth work.

Highest census of Millard Fillmore during 1940 was 302, with an average daily census of 265 A total of 4,921 operations was performed at the institution, and its ambulances made 1,017 calls Laboratory examinations reached the impressive figure of 86,683 The active outpatient department reported a total of 16,721 visits Harold A. Grimm is superintendent of Millard Fillmore Hospital

Doing a splendid job on Buffalo's West Side is the Columbus Hospital, of which Dr Charles R Borzilleri, Sr, is president Founded in 1908 by Dr Borzilleri, it is a general voluntary hospital with a capacity of 150 beds It has been approved by the American College of Surgeons

On October 23, 1939, a new three-story wing was opened This was the seventh major addition to the hospital This wing contains enlarged outpatient quarters in the basement,

a surgical suite on the ground floor, and private rooms and semiprivate rooms on the second and third floors During the past year 2,461 patients were hospitalized, and 12,087 visits were recorded in the outpatient department

Another Buffalo hospital doing surgical, medical, and obstetric work is the Lafayette General Hospital, 113 Lafayette Avenue, of which Dr D C O'Connor is president

Lafayette General was incorporated in 1910 It has sixty-four adult beds and seventeen bassinets It renders a distinct service to residents of the North Buffalo section

One of the city's best known Catholic institutions is the Buffalo Hospital of the Sisters of Charity, 1855 Main Street Founded by three Sisters of Charity in 1848, it was the first hospital in Buffalo, the first to institute an emergency hospital, and the first to organize a training school for nurses

From time to time the capacity of the hospital has been increased For the last forty years it has had a capacity of 200 beds During the past year it admitted 4,960 patients This institution boasts excellent facilities X-ray equipment is new, operating rooms are equipped to meet the needs of every specialty in surgery, and the laboratory is under the direction of a well-known pathologist Sister Hortense is superintendent

In the heart of the Humboldt area in Buffalo is located the Deaconess Hospital, 563 Riley Street Incorporated in 1896, it is a general hospital with a bed capacity of 190 for adults and children and thirty-five bassinets During 1940, admissions totaled 6,417, operations, 4,163, deliveries, 1,045, autopsies, 117, laboratory examinations, 38,491, and x-ray examinations, 3,581

The hospital employs six interns yearly on a rotating basis It also has a one-year residency in surgery The hospital also conducts a school of nursing, average membership of which is 150 students Membership in the Erie County Medical Society is required for admission to the staff Henry T Brandt is managing director

Serving the people of South Buffalo is one of the city's most modern hospital buildings, Mercy Hospital, 565 Abbott Road Annual census figures, averaged over a period of years, are inpatients, 5,334, outpatients, 6,216, operations, 2,521, and births, 1,051

Among attractions for convention delegates will be a clinic covering a selected list of non-malignant cases being treated by the deep therapy department The medical department will present a survey of the treatment of

pneumonia for the last thirteen years, showing an average mortality of 39 per cent from 1928 to 1938, inclusive, and an average mortality rate of 9 per cent for 1939 and 1940

Mercy Hospital also will give a demonstration on the technic of the maternity department in its care of the newborn. The blood bank in operation also will be demonstrated. Taxi service to and from Mercy Hospital will be provided for convention delegates who wish to attend. Sister Mary Gerard is superintendent.

Of tremendous interest to delegates should be the State Institute for the Study of Malignant Diseases, 663 North Oak Street. Organized in 1898, the institute is the oldest laboratory and hospital for research in cancer in the country. It has a 100-bed capacity and is equipped with the most modern facilities for the irradiation treatment of cancer, together with a modern radiographic department and a large outpatient department.

The institute renders free pathologic diagnosis to any physician in New York State and a free diagnostic clinical service to assist family physicians and patients in arriving at a diagnosis of cancer. Dr. Burton T. Simpson is director.

The United States Marine Hospital, 2183 Main Street, is a field unit of the United States Public Health Service for the Government medical care of its beneficiaries. In operation since 1909, it has a capacity of seventy-five beds.

The beneficiaries treated here are American and foreign seamen, officers and enlisted men of the Coast Guard, officers and enlisted men of the U S Army, U S Navy, U S Marine Corps, and other federal employees. During the past year, some 5,000 outpatients received treatment, in addition to the inpatients. M S Lombard, medical director of the United States Public Health Service, is the medical officer in charge.

One of the leading institutions in the country for the treatment of children is the Children's Hospital, 219 Bryant Street. It has extensive facilities for the treatment of all kinds of diseases and is equipped with some of the most modern facilities in the Buffalo area.

A small but highly regarded North Buffalo institution is the Central Park Hospital, 2787 Main Street, which specializes in unusual cases and which has built up an enviable reputation in recent years.

Serving the great steel city of Lackawanna, south of Buffalo, is Our Lady of Victory Hospital, a portion of Father Baker's Lady of Victory Institution, 800 Ridge Road, Lackawanna. A large institution, this hospital offers a wide variety of services.

With this vast array of institutions at the disposal of delegates, opportunities for interesting visits appear almost unlimited. All Buffalo area hospitals will have the welcome sign out for association members and this should prove to be an excellent opportunity for gathering new ideas in upstate institutions.

Telephone CHelsea 3-1646

To the Editor

We shall have an opening at the main hospital station of the International Grenfell Association at St. Anthony, Newfoundland, for a house officer on a twelve or fifteen months' contract commencing July 1, next.

This is an exceptionally interesting appointment with opportunity for varied surgical and medical experience in a modern eighty-bed hospital, with T B and convalescent annexes, in unusual surroundings. Applicants must be

unmarried, graduate of approved medical school with two years' internship in a recognized hospital.

If you should know of anyone suitable, who would be interested in this appointment, I should appreciate it very much if you would ask them to send an application to this office.

Yours sincerely,

KATHLEEN YOUNG
Staff Selection Committee

RENAL FUNCTION TESTS

DONALD D. VAN SLYKE, Ph D., New York City

THE modern theory of renal function reached from work in the laboratories of Richards, Marshall, Smith, Shannon, and others^{1, 2} is that as the blood courses through the glomerular capillaries a part of the plasma water is filtered out into the capsular spaces of the glomeruli. This fraction appears to be usually about 20 per cent of the total plasma water. With this water are filtered all the sugar, salt, urea, uric acid, creatinine, and other noncolloidal substances dissolved in the water as it circulates in the plasma. The rate of glomerular filtrate formation in man appears to be at the rate of about 6 L. per hour, or 150 L. per twenty-four hours.

Renal Physiology on Which Function Tests Are Based

The filtrate is formed by mechanical filtration. All the dissolved substances of the plasma are in it, not only those such as urea and uric acid, which are waste products to be gotten rid of, but also the glucose and bicarbonate, which are needed in the body. Other substances such as the water and salt of the filtrate are filtered in much greater amounts than the body can afford to lose. To let the waste products pass into the urine and at the same time to save the blood substances that are needed in the body, the cells lining the tubules exert a highly selective action in reabsorbing the needed substances and letting pass into the urine the waste products and such amounts of sodium chloride, water, and other partially needed materials as are required to maintain normal volume and composition of the body fluids.

Besides their power of selective reabsorption the tubules have a reserve function of excretion; the tubular cells can pick foreign substances, such as injected dyes, from the blood and extrude them into the tubular lumina, whence they pass into the urine. This function appears to have no important part in man in the excretion of naturally occurring urinary substances; it is a reserve power used to handle foreign substances that cannot be excreted by means of glomerular filtration. Tubular excretion is the process by

which injected phenolsulfonphthalein is excreted.^{1, 2}

As the result of comparing various tests of renal function in the nephritic clinic of the Rockefeller Hospital we have reduced our routine tests to two—(1) the urea clearance as an indicator of changes in glomerular excretion, and (2) the urine specific gravity test as a measure of tubular reabsorbing power. Many other tests are in the literature and can yield results of value. The above two, however, yield all the information that is usually necessary for diagnostic purposes, they are simple to carry out, and the technic is based on methods that do not easily go wrong. The creatinine clearance gives results quite similar to those of the urea clearance, but it is less practical because the methods for determination of the true creatinine content of the blood are difficult—part of the substance determined in older blood creatinine analyses has been shown by Dubos and Miller not to be creatinine at all but other materials that give the creatinine color test. To obviate the error from these substances involves the use of a special enzymic technic which is not practical for a routine laboratory. Without this elaboration of technic, creatinine clearances are not of even approximate accuracy.

There are a number of specific gravity tests in the literature. Most of them depend upon restricting fluid intake for a certain length of time; the specific gravity is measured in the urine passed during the latter part of the restricted period. It does not matter greatly what regimen is used for such a test so long as the range of specific gravities yielded by it in normal subjects is established and the deviations that accompany renal diseases of different types of severity are ascertained. In our clinic the concentration test technic developed by Addis^{1, 2} is used. It consists of putting the patient on a dry diet for twenty-four hours, from one morning to the next, and determining the specific gravity in the urine passed during the last twelve hours of the twenty-four. This technic has the advantage that it also yields a urine fit for the sediment count of Addis.

For simplicity, the present discussion will be limited to the technic and results of the

Read by invitation at the Annual Meeting of the Medical Society of the State of New York, New York City, May 9, 1940.

From the Hospital of the Rockefeller Institute for Medical Research, New York City.

pneumonia for the last thirteen years, showing an average mortality of 39 per cent from 1928 to 1938, inclusive, and an average mortality rate of 9 per cent for 1939 and 1940

Mercy Hospital also will give a demonstration on the technic of the maternity department in its care of the newborn. The blood bank in operation also will be demonstrated. Taxi service to and from Mercy Hospital will be provided for convention delegates who wish to attend. Sister Mary Gerard is superintendent.

Of tremendous interest to delegates should be the State Institute for the Study of Malignant Diseases, 663 North Oak Street. Organized in 1898, the institute is the oldest laboratory and hospital for research in cancer in the country. It has a 100-bed capacity and is equipped with the most modern facilities for the irradiation treatment of cancer, together with a modern radiographic department and a large outpatient department.

The institute renders free pathologic diagnosis to any physician in New York State and a free diagnostic clinical service to assist family physicians and patients in arriving at a diagnosis of cancer. Dr. Burton T. Simpson is director.

The United States Marine Hospital, 2183 Main Street, is a field unit of the United States Public Health Service for the Government medical care of its beneficiaries. In operation since 1909, it has a capacity of seventy-five beds.

The beneficiaries treated here are American and foreign seamen, officers and enlisted men of the Coast Guard, officers and enlisted men of the U S Army, U S Navy, U S Marine Corps, and other federal employees. During the past year, some 5,000 outpatients received treatment, in addition to the inpatients. M S Lombard, medical director of the United States Public Health Service, is the medical officer in charge.

One of the leading institutions in the country for the treatment of children is the Children's Hospital, 219 Bryant Street. It has extensive facilities for the treatment of all kinds of diseases and is equipped with some of the most modern facilities in the Buffalo area.

A small but highly regarded North Buffalo institution is the Central Park Hospital, 2787 Main Street, which specializes in unusual cases and which has built up an enviable reputation in recent years.

Serving the great steel city of Lackawanna, south of Buffalo, is Our Lady of Victory Hospital, a portion of Father Baker's Lady of Victory Institution, 800 Ridge Road, Lackawanna. A large institution, this hospital offers a wide variety of services.

With this vast array of institutions at the disposal of delegates, opportunities for interesting visits appear almost unlimited. All Buffalo area hospitals will have the welcome sign out for association members and this should prove to be an excellent opportunity for gathering new ideas in upstate institutions.

KATHLEEN YOUNG
Staff Selection Committee

April 1, 1941

subject lies down during the test or walks about Van Slyke, Alving, and Rose²¹ found in examinations that it made no difference in any patient who showed more than 50 per cent of normal clearance, but 3 out of 12 of their nephritic patients with less than 50 per cent normal function showed lower clearances if they were up and about. It is therefore desirable that nephritic patients who have advanced to less than 50 per cent of normal clearance rest in a reclining posture during the test, but in other subjects it is not essential.

It is desirable to promote a fairly free flow of urine during the test in order to diminish the relative error caused by retention of urine in the collecting tubules and bladder at the voidings. For this purpose we routinely give two glasses of water, one at the beginning of the test and another an hour later after the first specimen of urine has been collected. This is the only special preparation of the subject which we routinely follow. It may be omitted when for any reason it is desirable to do so.

Collecting the Urine—It is desirable to collect two specimens of urine, each over a measured period for which about an hour is a satisfactory time. A single specimen of blood for analysis drawn near the middle of the two-hour interval serves for comparison with both urine specimens. In consequence, two clearances are measured with only one drawing of blood.

To start the first period, the subject, after drinking his first glass of water, empties his bladder completely without saving the specimen, and the time is recorded or a stop-watch is started. At the end of approximately an hour the subject again voids completely, and the specimen is saved (period 1). At the moment when the subject finishes voiding, the time is recorded as the first period, and the watch is immediately restarted for the second period. The subject then drinks his second glass of water.

At approximately the end of the second hour he again voids completely. The time of this period is accurately recorded, and the specimen is saved (period 2).

It is not necessary that the duration of each period shall be an hour. It may be longer—up to several hours—or it may be shorter than an hour, provided enough urine (preferably over 50 cc) is voided to prevent undue error from the volume retained. The essential things are that the time be exactly recorded and that the complete urine content of the bladder be ob-

tained. The person in charge of the urine collection should be impressed with the fact that there is no need of making the collection periods exactly an hour each but that it is necessary to record exactly the time at which the voiding of each specimen is finished.

In some patients it is impossible to obtain urination at will. In such cases one may continue the collection period for several hours until spontaneous urination occurs, provided the time is accurately recorded. Especially in young children, it is frequently necessary to wait for spontaneous urination. For these, an automatic recording device described by Farr⁵ is a great advantage.

Urine Measurement—The urine from each period is measured within 1 per cent. Accurate graduate cylinders of 25, 50, 100, and 200 cc are kept at hand, and the smallest that will contain the specimen is used.

Collecting Blood—At about the end of the first hour of the usual two-hour test, a sample of blood is drawn for analysis. Ordinarily, when no urea has been administered, the change of blood urea content is slow so that a matter of a half hour, sooner or later, is not important. We usually draw about 2 cc of blood, which is sufficient for duplicate urea analyses by the manometric hypobromite method¹⁶ by which an analysis can be done in four minutes. When, however, economy of blood is desirable, 0.2 cc is taken from a finger or ear or, for small children, from the heel as described by Drucker and Cullen,⁴ and the urea is determined by microanalysis.

Normal Variation of the Clearance—Physiologic experiments have shown that in normal animals the urea clearance varies parallel with the renal blood flow, which undergoes spontaneous changes from moment to moment. Also, Smith and Goldring¹⁸ report evidence that varying constriction of the efferent arterioles of the glomeruli can vary the percentage of plasma water filtered and, hence, the clearance. Consequently, variation of the clearance over a certain range is an entirely normal phenomenon—is, in fact, an evidence of normal functional elasticity of the kidneys. The usual range in man is approximately from 75 to 130 per cent of average normal. Occasionally, a single clearance determination on a normal subject will fall outside this range.

As a clearance decreases in a nephritic case, the variability becomes less, e.g., when the mean clearance is reduced to 10 per cent of average normal, the fluctuations are likely to be limited to between 8 and 12.

FIG 1 Chart indicating the number of times urine is to be diluted in order to make the urea concentration equal to the blood urea concentration when the urea clearance is normal. When the urine is so diluted, the ratio, 100 U/B indicates the percentage of normal urea clearance, where U is the urea concentration of the diluted urine and B is the urea concentration of undiluted blood. From Van Slyke and Cope.²³

urea clearance, the specific gravity test, and the familiar phthalein excretion test.

The Urea Clearance

Definition and Significance of the Urea Clearance *—The average normal adult, when excreting urine in fairly abundant volume, excretes per minute the amount of urea contained in 75 cc of his blood. Excretion suffices to clear the urea from 75 cc of blood in one minute. Hence we use the term "urea clearance" to indicate the volume of blood that one minute's excretion clears of urea.

The same volume of blood is cleared, regardless of whether its urea content at the moment is high or low. If, by feeding urea, the blood content is greatly increased, the excretion rate increases proportionately so that the amount of urea excreted per minute remains equal to the amount contained in 75 cc of blood. Consequently, the clearance is not affected by variations in the rate at which urea is formed, the same clearance

values are obtained in the fasting subject as after a protein meal has raised the blood urea.

"Clearance" serves as a convenient term to picture the direct relation between blood urea content and rate of excretion. A clearance of 75 does not indicate that 75 cc of blood flow through the kidneys per minute with complete removal of the urea. On the contrary, to judge from experiments carried out by Rhoads, Hiller, Alving, and Van Slyke,²⁴ about ten times as great a volume of blood perfuses the kidneys, and only one-tenth of its urea is excreted.

Calculation of the Urea Clearance—The clearance can be calculated from blood and urine urea contents and the rate of urine excretion by formulas,^{11,14 15,19} but perhaps the simplest way is to dilute the urine a certain number of times, depending upon the volume excreted per hour, and then compare the urea content of urine with that of the blood. The percentage of normal urea clearance is then indicated simply as

$$\text{Percentage of normal urea clearance} = 100 \times \frac{\text{Concentration of urea in diluted urine}}{\text{Concentration of urea in blood}}$$

Fig 1 indicates the extent to which the urine is to be diluted.

A simple colorimetric urea clearance determination has been published²² in which no absolute urea determinations are required. The urine diluted according to Fig 1 is simply compared colorimetrically with the blood in the two cups of a colorimeter, and the percentage of normal urea clearance is given by the colorimeter reading.

Occasionally, a clearance is required on a single kidney. To calculate its excretion in percentage of the normal, the observed urine volume obtained from the single kidney is multiplied by 2, and dilution by Fig 1 is made according to the doubled volume.

For children, a correction for body size is made by multiplying observed urine volume

by the factor $\frac{1.73}{\text{square meters body surface}}$. The urine volume thus corrected is applied to Fig 1.^{11,15}

Technic of Collecting Blood and Urine for the Urea Clearance

Preparation of Subject—Except in fairly advanced cases of nephritis, it ordinarily makes no significant difference whether the

* An outline of the physiologic work from which the clearance evolved may be found in the chapter on Urea in *Quantitative Clinical Chemistry*, vol 1, by Peters and Van Slyke.

The Specific Gravity Test^{1,2}

The patient, after breakfast at the beginning of a twenty-four-hour period, takes no fluids until breakfast the next morning. During the last twelve hours of the period the urine is collected separately and its specific gravity is determined, the gravity of water at the same temperature being taken as 1.000. If much albumin is present, the albumin content must, for accurate results, be determined and a correction made for its effect on the specific gravity. The correction is made as shown by Lashmet and Newburgh,¹⁰ by subtracting from the observed specific gravity 0.003 for each per cent of protein in the urine. A patient with normal kidneys will practically always void, during the last twelve hours of the test period, a urine with a gravity over 1.026.

The Phthalein Excretion Test

The determination of the excretion rate of phenolsulfonphthalein after intravenous or subcutaneous injection was introduced in 1912 by Rowntree and Geraghty¹⁴ and was the first excretory test to gain general application. It has been immensely useful and is still much employed. In the original form in which the amounts of dye excreted after one and two hours were measured, comparative tests showed²⁵ that the phthalein excretion was much less sensitive than the urea clearance. Some chronic cases with obvious nephritis, which showed by the clearance as little as one-third of normal excretory ability, still gave phthalein outputs within the normal range. For this reason, as well as for the fact that the phthalein test is complicated by quantitative injection of a foreign substance, the test was abandoned in our clinic after the urea clearance had become established.

Later, Shaw¹⁷ improved the phthalein test by always making the injections intravenously and by collecting the urine in fifteen-minute intervals, the subject being given plenty of fluids before the test in order to assure a free flow of urine. Chapman and Halstead³ found the test as sensitive as the urea clearance. Freyberg⁸ has compared this test in a series of nephritic and normal patients with the colorimetric urea clearance test. He found that when the excretion during the first fifteen minutes (normally 30 to 50 per cent of the injected dye) was used the phthalein test fairly closely paralleled the urea clearance. However, Freyberg found the urea clearance simpler to carry out with accuracy and subject to fewer sources of error.

FIG 3 Relation of proportion of perfusable glomeruli to urea clearance in nephritic subjects. The curve indicates approximately the mean relation found by Hayman and Johnston.⁹

As shown by Marshall,¹² phthalein is excreted almost entirely by extrusion from the tubules instead of by the glomerular filtration which removes natural excretory products from the blood. The fact that the fifteen-minute phthalein test parallels the urea clearance in most cases indicates that when the excretory units are damaged in nephritis the damage affects the entire unit. However, in advanced nephritis the phthalein output is likely to approach zero²⁵ and fail to indicate further changes in renal condition.

Interpretation of the Urea Clearance in Nephritis in Terms of Glomerular Damage—Hayman and Johnston⁹ have counted the perfusable glomeruli in the kidneys of patients dying with various degrees of impaired urea clearance and have found that the fall in clearance was a function of the proportion of glomeruli destroyed. It was not a simple direct proportion. The destruction of 50 per cent of the glomeruli did not cause a 50 per cent fall in urea clearance—only about 20 per cent. Presumably, the remaining half of the glomeruli by increased activity compensated in part for their decrease in number. This conclusion from Hayman's results is in accord with the observation of Foster.⁷ His nine patients who had undergone unilateral nephrectomy and who after recovery had returned to normal life were found to have urea clearances within the normal range for subjects with both kidneys intact. As destruction of glomeruli proceeds beyond the 50-per-cent point, the urea clearance falls at

FIG 2. Comparison in 10 nephritic patients of the range of the values of the urea concentration ratio, U/B , with the urea clearance

Use of Urea Concentration Ratio in Place of Urea Clearance—In some cases it is inconvenient or impracticable to obtain urine passed during definite time intervals. The patient may not be able to spend the necessary time for the collection, or he may have bladder retention which makes complete voiding impossible. In such cases one can determine the ratio (urea concentration in urine/urea concentration in blood) in place of the clearance if the urine is passed under

conditions that guarantee that the volume will be less than 100 cc per hour.²³ If the urine is passed in the morning before fluids have been taken, it can usually be assumed that this condition is met. The concentration ratio in a normal subject will then usually be above 50. In nephritic subjects one can estimate roughly the percentage of normal urea clearance by multiplying the urea concentration ratio by 2 (see Fig 2).

always becomes chronic. We have seen 1 or 2 children with acute nephritis break this rule and recover after continuing more than four months with minimal clearances, but such fortunate cases are exceptions.

Return of clearance to normal does not always demonstrate complete recovery or even escape from the danger of a subsequent chronic course ending in uremia. So long as low specific gravity, hematuria, urinary casts, hypertension, or any other of the abnormalities that accompany nephritis are still evident, renal disease is still present and may progress even though excretory function is normal for the time being. A normal renal function test does not prove the absence of pathologic lesions in the kidneys. In Fig 6 is shown a case that, after approaching functional recovery, went into a chronic progressive nephritis and died after two years in uremia.

Urea Clearance and Specific Gravity Tests in Chronic Nephritis.—The early stages of chronic nephritis may not show much reduction in the clearance, especially when the case is predominantly of the nephrotic type with insidious onset. The urea clearance may be nearly or quite within normal range. On the other hand, many cases, as soon as they can be diagnosed as chronic, show clearances down to one-half or one-third of normal.²⁶ The prognosis depends to a considerable part on how rapidly the clearance continues to fall. A steadily falling clearance, as in the case of Fig 5, leads with tragic sureness to uremia. But relative stabilization may occur at any point above 20 per cent of normal, and both renal function and clinical condition may remain unchanged for periods of a year or more.

By the time the clearance has fallen to 30 per cent of normal, the specific gravity has usually reached its bottom level in the range 1.008 to 1.012 as shown in Fig 6. As renal function falls from this point downward, one must depend entirely on the clearance for evidence of the changes because the specific gravity can fall no further.

The relative behaviors of the clearance and specific gravity tests may be summarized by stating that, in most cases, the specific gravity is the more sensitive indicator of mild degrees of damage, while the clearance must be relied upon to indicate changes in the more severe degrees.

If the specific gravity shows a normal result, it is usually unnecessary to measure the clearance also. But if the specific gravity is low, a clearance must be done to find whether it is

FIG 6 Course of a case of Bright's disease with apparent move toward recovery in first months, followed, however, by a steady progress of renal destruction and death in two years with a urea clearance 3 per cent of normal. The urine specific gravity in Addis concentration tests reached bottom value six months after admission when the clearance was still 30 per cent of normal and was unaffected by the further progress of the disease. From Alving and Van Slyke.²

in the range of 30 or 40 per cent, which might be consistent with a subjectively well and active condition for several years, or whether the clearance is below 10 per cent with uremia due in a short time.

Urea Clearance and Uremia

With regard to the relation of uremia and the clearance, it has been found that, regardless of the origin or nature of the renal injury, when the urea clearance falls to 5 per cent of normal the clinical condition of uremia is either present or imminent. This is true even when the fall in clearance is due to such extrarenal causes as surgical shock, if the condition continues.

Changes in Clearance Caused by Influences of Extrarenal Origin

As pointed out by Arthur Fishberg,⁶ conditions of shock or depression in which the blood is withdrawn from peripheral circulation may depress renal function almost to zero, presumably because the renal blood flow is decreased in the peripheral circulation. Such a state occurs in traumatic shock, in

FIG 4 Course of a case of acute nephritis with recovery. The urea clearance began to return to normal within one month after onset and in two months reached normal. The specific gravity obtained in the Addis concentration test did not improve at all during this interval but was normal seven months later. From Alving and Van Slyke.²

an increasingly rapid rate. The mean relation between the number of surviving glomeruli and the urea clearance found by Hayman is shown by Fig 3.

Besides glomerular destruction, the urea clearance can be diminished by shock and other conditions that retard the renal blood flow or lower the blood pressure in the glomerular capillaries and by the back pressure of partial obstruction of the urinary tract. These influences of extrarenal origin will be discussed later.

The Urea Clearance and Specific Gravity Tests in Acute Nephritis.—In mild cases of acute or initial nephritis, renal function may not be at all affected. In severe cases, on the other hand, the clearance may fall to a fraction of normal and the specific gravity to the uremic range in the neighborhood of 1.010. Such a case is shown in Fig 4. Decrease in function in acute nephritis does not necessarily carry a grave prognosis. Such severe cases may recover completely as did the one shown in Fig 4.

In comparing the clearance and the gravity test, an interesting difference is often shown in the rapidity with which they return to normal during recovery from acute nephritis.

The clearance may reach normal weeks or months before the gravity even begins to rise. This behavior is exemplified in Fig 4. Three months after onset the urea clearance had returned completely to normal, while the gravity was still unchanged at 1.011. When the patient returned for examination seven months later, both clearance and specific gravity were normal. In Fig 5 is shown the case of a boy who for five years showed a

FIG 5 Course of a case of Bright's disease with normal urea clearance and subnormal urine concentration which persisted over five years. Proteinuria and hematuria confirmed the low specific gravity in indicating persistence of renal pathology. The patient has since recovered completely, insofar as clinical, urinary, and functional findings can show. From Alving and Van Slyke.²

subnormal specific gravity in the presence of a normal clearance. Eventually complete recovery occurred. It appears that in the milder degrees of renal damage the specific gravity is often more sensitive than the clearance. In terms of renal physiology, the concentrating function of the tubules is likely to show damage when the filtering function of the glomeruli does not. Often both tests are affected alike, but, when only one shows a decrease, it is almost always the specific gravity.

With regard to the prognosis of acute nephritis, it has been found²⁵ that in cases where the urea clearance has fallen a *beginning* of a rise toward normal almost always occurs *within four months of onset* if recovery is to follow. When four months pass without a rise in the clearance, the condition almost

always becomes chronic. We have seen 1 or 2 children with acute nephritis break this rule and recover after continuing more than four months with minimal clearances, but such fortunate cases are exceptions.

Return of clearance to normal does not always demonstrate complete recovery or even escape from the danger of a subsequent chronic course ending in uremia. So long as low specific gravity, hematuria, urinary casts, hypertension, or any other of the abnormalities that accompany nephritis are still evident, renal disease is still present and may progress even though excretory function is normal for the time being. A normal renal function test does not prove the absence of pathologic lesions in the kidneys. In Fig 6 is shown a case that, after approaching functional recovery, went into a chronic progressive nephritis and died after two years in uremia.

Urea Clearance and Specific Gravity Tests in Chronic Nephritis—The early stages of chronic nephritis may not show much reduction in the clearance, especially when the case is predominantly of the nephrotic type with insidious onset. The urea clearance may be nearly or quite within normal range. On the other hand, many cases, as soon as they can be diagnosed as chronic, show clearances down to one-half or one-third of normal.²⁵ The prognosis depends to a considerable part on how rapidly the clearance continues to fall. A steadily falling clearance, as in the case of Fig 5, leads with tragic sureness to uremia. But relative stabilization may occur at any point above 20 per cent of normal, and both renal function and clinical condition may remain unchanged for periods of a year or more.

By the time the clearance has fallen to 30 per cent of normal, the specific gravity has usually reached its bottom level in the range 1.008 to 1.012 as shown in Fig 6. As renal function falls from this point downward, one must depend entirely on the clearance for evidence of the changes because the specific gravity can fall no further.

The relative behaviors of the clearance and specific gravity tests may be summarized by stating that, in most cases, the specific gravity is the more sensitive indicator of mild degrees of damage, while the clearance must be relied upon to indicate changes in the more severe degrees.

If the specific gravity shows a normal result, it is usually unnecessary to measure the clearance also. But if the specific gravity is low, a clearance must be done to find whether it is

FIG 6 Course of a case of Bright's disease with apparent move toward recovery in first months, followed, however, by a steady progress of renal destruction and death in two years with a urea clearance 3 per cent of normal. The urine specific gravity in Addis concentration tests reached bottom value six months after admission when the clearance was still 30 per cent of normal and was unaffected by the further progress of the disease. From Alving and Van Slyke.²

in the range of 30 or 40 per cent, which might be consistent with a subjectively well and active condition for several years, or whether the clearance is below 10 per cent with uremia due in a short time.

Urea Clearance and Uremia

With regard to the relation of uremia and the clearance, it has been found that, regardless of the origin or nature of the renal injury, when the urea clearance falls to 5 per cent of normal the clinical condition of uremia is either present or imminent. This is true even when the fall in clearance is due to such extrarenal causes as surgical shock, if the condition continues.

Changes in Clearance Caused by Influences of Extrarenal Origin

As pointed out by Arthur Fishberg,⁶ conditions of shock or depression in which the blood is withdrawn from peripheral circulation may depress renal function almost to zero, presumably because the renal blood flow is decreased in the peripheral circulation. Such a state occurs in traumatic shock, in

gastrointestinal obstruction, in Asiatic cholera, sometimes in acute infections of children, and in various other conditions. The derangement, if it is not permitted to continue till fatal uremia develops, is temporary, and renal function is restored as soon as the circulation recovers. Examples of this type of renal failure are described by Wohl, Brust, and Freed.¹⁶

In surgery the conditions of reflex anuria of nervous origin is believed to occur. Ordinarily, however, the extrarenal nervous influences appear to play a relatively small part in causing the spontaneous variations in the clearance. Van Slyke, Rhoads, Hiller, and Alving,²⁴ in experiments on dogs, and Page and Heuer,¹³ in observations on patients before and after renal denervation, could find no effect of denervation on either the normal level or the normal variability of the clearance.

Back pressure due to partial ureteral, prostatic or urethral obstruction may markedly diminish the clearance. Hence, the interpretation of a low clearance as evidence of renal damage is to be made with caution when such obstruction is present.

Before diminished clearance is interpreted as an indicator of renal destruction, the possibility of the existence of these extrarenal factors as causes of, perhaps, temporary diminution in renal function should be considered in any case that has not an obviously nephritic history and even in a case that has such a history if the urea clearance has suffered a sudden fall. Such a fall may be due not to accelerated renal destruction but to the added effect of one of the above extrarenal factors. The nephritic patient is more subject to conditions of collapse than the normal person, and in the person suffering from nephritis a smaller degree of shock will cause fatal renal failure. Vomiting, dehydration, and circulatory failure may cause a temporary fall in renal function. This may lead to uremic death long before it would be caused by the organic destruction of the kidneys.

Summary

Studies of renal physiology indicate that the urea clearance serves as an indicator of glomerular filtration, while concentration tests with urine-specific determinations serve to indicate the ability of the tubules to concentrate the filtrate. The procedures for making these tests are outlined.

The concentration test is more sensitive than the clearance to slight degrees of renal

damage. Hence, if the concentration test yields a normal result, it is not necessary to measure the clearance.

On the other hand, the concentration test fails to show differences between moderate and severe renal damage. If the concentration test yields a urine of low specific gravity, it is necessary to determine also the urea clearance in order to ascertain whether the decrease in excreting power is serious. A specific gravity of 1.010 in the concentration test may in one case be accompanied by entirely normal excreting power and in another case by extreme loss of excretory power and onset of uremia. Excretory power and clinical condition follow the clearance—not the specific gravity.

A low clearance in an acute case does not necessarily indicate a grave prognosis. Complete recovery may occur.

Including various types of shock, numerous conditions of extrarenal origin without organic damage of the kidneys may so affect the renal circulation that kidney function is retarded to a severe degree, as pointed out by Fishberg. If permitted to continue, these conditions can result in death from renal failure in the absence of renal disease. As complications of renal disease, these conditions often bring on premature uremia.

When the clearance falls to 5 per cent of normal, regardless of the origin or type of renal condition, uremia is either present or imminent.

Discussion

Dr Ralph G. Stillman, New York City—The medical profession owes a great debt to Dr Van Slyke and to those investigators who, like him, have worked in great institutions and have been successful in solving problems which by their very nature cannot be attacked by the practicing physician. One of the hopes of the practitioner of medicine has been that studies of the function of an organ might reach such completeness that the information so obtained would be of value in the diagnosis and treatment of disturbances of that organ. This hope appears to have been largely fulfilled in the development of the tests of kidney function, and we are now able, by the use of the methods that Dr Van Slyke has

discussed, not only to recognize the presence of reasonably well-defined damage to the kidneys but also, to a surprising degree, to estimate the extent of the damage and whether it is increasing or regressing. What is still more important, the techniques described are comparatively simple and the inconvenience to the patient is minimal. This information has also been of tremendous assistance in the management of cases of nephritis, and it is likely that its use will bring about changes that will result in a more uniform treatment of this disease.

It is admitted that these tests are relatively insensitive, and thus must necessarily be so when we are dealing with an organ that possesses such an abundant reserve, but this is practically of little importance. The success that has been attained in this field encourages one to hope that the time is not far off when satisfactory tests of the function of such organs as the liver and the pancreas may be devised. The physician should be encouraged to supplement his clinical observation by the free use of the measures here presented, and he can be assured that both he and his patients will benefit thereby. I wish to express my appreciation of the opportunity to hear this clear presentation of an important subject by one who speaks with such unquestionable authority.

THE PHYSICIANS' HOME has established a definite niche in the medical Hall of Fame in the State of New York.

As the world moves headlong into an uncertain future, we have a serious and immediate need *to accommodate more guests*. Lack of sufficient endowment confronts us. *We need and deserve your continued support!*

A STUDY OF PRIMARY STAPHYLOCOCCIC PNEUMONIAS OCCURRING AT THE ROCHESTER GENERAL HOSPITAL

ISTVÁN A. GÁSPÁR, M D, Rochester, New York

SINCE 1904 when Fraenkel⁵ for the first time isolated the staphylococcus in pure culture from the lung of a pneumonia patient, there has been a slowly increasing number of reports dealing with staphylococcic pneumonias. These publications established the fact that there are pneumonias in which the staphylococcus is the only or at least the predominating causative organism.

In 1919 Chickering and Park² reported 153 cases of fatal staphylococcic pneumonias which developed in patients with infection of the upper part of the respiratory tract diagnosed as influenza. This number represented about 11 per cent of the total pneumonia cases under their observation. In 1927 Cole⁴ reported on primary atypical pneumonias, and 9 per cent of these was associated with the staphylococcus. In 1929 Habbe⁶ found that 17 per cent of the various anatomic forms of pneumonia was caused either by pure culture of staphylococci or by the staphylococci in combination with other microorganisms. Reimann,¹² reporting in 1933, characterized staphylococcic pneumonias as primary, bronchogenic infections of the lung, superimposed on some previous conditions, such as sore throat, influenza-like infection, asthma, malnutrition, etc. Macgregor's⁹ publication in 1936 admitted that out of her 10 cases occurring in children there were only 4 with indication of antecedent infection of the respiratory tract. In the other 6 cases there was no evidence that the staphylococcus was not alone responsible. Reports by other authors showed the relative incidence of pneumonias due to staphylococci and revealed that the staphylococcic etiology of pneumonias is by no means rare.

The vigorous crusade against pneumococcic pneumonia during the past decade focused attention mainly on lung infections caused by the various types of pneumococci. The other bacterial agents, notably staphylococci, were not seriously considered as primary inciting agents of pneumonia and were left more or less in the background. Even pathologists have somewhat neglected to pay more attention to staphylococci and have

failed to search persistently for other bacteria than pneumococci in every postmortem case of typical or atypical pneumonia.

For this reason I studied my postmortem material of the past seven years, 1933 to 1939, at the Rochester General Hospital to see the subject in the light of personal observations. In about 1,400 autopsies during this period there were 144 cases of lobar and bronchopneumonias. Thirty-eight of these were caused by staphylococci, either as the only bacterial agent or as the predominating organism. In other words, about 25 per cent of all pneumonia deaths occurring at the Rochester General Hospital during a seven-year period was due to staphylococcic infection. Twenty cases occurred within the first year of life, 8 were found from the second to the tenth year, 4 during the third decade, and 6 cases above the fortieth year. Therefore, roughly about 75 per cent of the staphylococcic pneumonias occurred within the first decade of life.

Gross Pathology of Staphylococcic Pneumonia

A fairly constant finding was the presence of tracheitis and bronchitis. Tracheobronchial mucosa was usually red, occasionally hemorrhagic. It was covered with mucus, with mucopurulent or purulent material, or with a sanguinopurulent exudate. In some cases the bronchi were filled with blood. The exudate often caused complete plugging of bronchi, thereby being responsible to a certain degree for the cyanosis observed during the sickness of a score of patients. Rarely was there no exudate in the bronchi.

The lesions in the lung parenchyma presented considerable morphologic variations in this series of cases.

Staphylococcic pneumonia when developing in the newborn during the first ten days of life appeared as lobular or lobar-type consolidation. The consolidated areas were firm, the cut section was dark red, hemorrhagic, and sometimes mottled with gray. The consolidations usually involved several lobes (Fig. 1) and not infrequently almost every part of both lungs. It seemed that in newborns the staphylococcic infection of the lungs was so overwhelming that death ensued early

Fig 2 Hemorrhagic consolidations of the lung with small spots of gray consolidation (later stage of *staphylococcic* pneumonia)

and the later stages of the disease had no time to develop

In older babies, particularly after the newborn period, and in other patients when the hemorrhagic consolidations did not involve the greater part of both lungs, reddish gray or gray consolidations developed (Fig 2). The disease lasted usually more than twenty-four hours when gray consolidations were present. In such areas later on, but not always, pinhead to pea-sized or larger abscesses developed (Fig 3). The abscesses were surrounded by red hepatization. Rarely, the gray or grayish yellow consolidations were small, the size of black pepper or smaller, and were arranged around small bronchi and scattered abundantly throughout both lungs without definite abscess formation.

There were 3 cases of *staphylococcic* lung infection with typical lobar-type pneumonia involving completely a single lobe in patients 55, 70, and 83 years of age. The consolidations were in the stage of grayish

yellow hepatization without the formation of abscesses (Fig 4).

The picture of diffuse capillary bronchitis with small patches of early consolidations was also observed. In such a case caused mainly by *Staphylococcus aureus*, the 3-month-old baby died in less than twenty-four hours after the onset of symptoms. Capillary bronchitis and abundant asphyctic hemorrhages of thymus, endocardium, and pleura were found at autopsy.

In this series of *staphylococcic* lung infections we found lung abscesses only in patients older than 10 days. Out of 38 cases, only 13 developed abscesses, therefore only about one-third of the series. Empyema was frequent and several times bilateral. It was present in 14 cases, 1 case being pyopneumothorax. In addition, several cases presented evidence of serofibrinous pleuritis.

Empyema was caused usually by rupture of a lung abscess into the pleural cavity. However, it was found to develop also without

FIG 3. Abundant small lung abscesses surrounded by hemorrhagic consolidations in the course of staphylococcic pneumonia

FIG 4. Lobar-type pneumonia due to *Staphylococcus aureus* involving the upper lobe in a 70-year-old patient

perforation of subpleural lung abscesses

Furthermore, there were some cases of empyema in which lung abscesses were completely absent. The occurrence of empyema was not limited to children because it was observed with staphylococcic pneumonia at any age. The amount of empyema pus was at times quite considerable. For instance, in a 51-year-old patient 3 L of pus was found in one chest cavity. Other complications were also encountered, such as pericarditis, parotitis, and abscess of the leg, each being seen only once subsequent to the pulmonary pathology.

Histology of Staphylococcic Pneumonia

Bronchi contained abundant blood, bloody pus, or only purulent exudate. The bronchial mucosa was markedly congested, often hemorrhagic, and ulcerated. There was no appreciable accumulation of inflammatory cells in the bronchial walls except in cases having chronic bronchitis or asthma before the onset of staphylococcic lung infection. Masses of staphylococci were present in the bronchial exudate in many cases. When the trachea showed inflammatory changes

they were similar to that found in the bronchi (Fig 5). In diffuse capillary bronchitis due to staphylococcus, the bronchi were plugged with mucus.

In the lung parenchyma the hemorrhagic consolidations were made up of alveoli filled with abundant red blood corpuscles (Fig 6). Masses of staphylococci were present without leukocytic barrage. Fibrinous exudate was scant or completely absent in the hemorrhagic consolidations. In more advanced cases, accumulation of leukocytes took place particularly around masses of staphylococci and abscesses developed (Fig 7). Frequently, there was necrosis around masses of staphylococci, and the leukocytic barrage was found only at a distance from the bacterial masses.

The abscesses were usually surrounded by hemorrhagic consolidations. However, fibrinous consolidations were also observed around abscesses, particularly with mixed infections.

In general, fibrinous exudate in the alveoli was rather scanty, and it was not abundant even in the lobar-type staphylococcic pneumonias (Fig 8).

Bacteriologic Studies

These studies included throat cultures whenever possible and sputum examinations when sputum was obtained. Cultures were taken at postmortem from lungs, empyema fluid, spleen, and occasionally from trachea and bronchi.

Throat cultures showed the presence of *Staph aureus* as the predominating organism up to 95 per cent in some throats. On the other hand, in 2 or 3 cases they were found only in small numbers or they were absent in spite of the subsequent finding of staphylococci pneumonia.

Unfortunately, sputum was searched for staphylococci but only in a few instances. However, in such cases the sputum showed abundant staphylococci. One of the staphylococci lobar pneumonia cases showed 98 per cent *Staph aureus* in sputum cultures.

Lung cultures were made practically in every case, and these revealed *Staph aureus* either in pure growth or as the predominating organism. The *Staph aureus* was either hemolytic or nonhemolytic. One case of pneumonia showed almost pure growth of hemolytic staphylococcus albus in a 2-month-old child, while a case of pneumonia of the new born showed only *Staph citreus*. Lung cultures of the 3 lobar pneumonia cases showed a pure growth of hemolytic staphylococcus aureus in 2 cases and as the predominating organism in the third case.

When the *Staph aureus* was the predominating organism in cultures of the lungs, one or two of the following bacteria were encountered besides the staphylococci: gram-negative bacilli, *Staphylococcus albus*, alpha and gamma streptococci, rarely beta hemolytic streptococci, and pneumococci. Tracheo-bronchial exudate was cultured a few times and a pure growth of *Staph aureus* was obtained. The spleen was cultured in 12 cases and revealed a pure growth of *Staph aureus* in 9 cases while the other 3 remained sterile.

Clinical Symptoms

Newborn babies having staphylococci pneumonia showed cyanosis, dyspnea, and irregular, shallow respirations. Some bleeding from nose and mouth and discharge from the ears were occasionally noted. When the disease developed after the newborn period, some infants became suddenly ill with chest findings, while others, the majority, presented signs of infection of the upper part of the respiratory tract: congestion of the throat, cough, occasional hoarseness, fever,

FIG 5 Photomicrograph of trachea showing acute hemorrhagic tracheitis caused by *Staphylococcus aureus*.

FIG 6 Histologic picture of the early stage of *Staphylococcus aureus* pneumonia. Abundant hemorrhages in bronchi and alveoli.

and difficult breathing. Practically every patient developed cyanosis. Signs of pneumonia with dullness, fine rales, and bronchial breathing developed afterward or simultaneously with the symptoms of the upper part of the respiratory tract. Chills were only rarely recorded. Patients over 10 years of age often presented chest pains as the first signs of their illness. Dyspnea, cyanosis, cough, sore throat, and raising of sputum were additional clinical features. At times, chill was observed at the onset of the disease. Only five blood cultures were done with positive staphylococci findings in 3 cases. The white blood count was elevated in the majority of the patients.

Discussion

This series of staphylococci pneumonias augments the available reports on this subject and substantiates the conclusions that staphylococci pneumonia is not a rare disease. This is particularly true if we look at it from the mortality angle as compared to the total pneumonia deaths. Twenty-five per cent of all pneumonia deaths was due to staphylococci lung infection.

The etiology in the entire series of cases was found out only at postmortem examination. Lung cultures in every case showed *Staph aureus*, except once hemolytic staphy-

FIG 7 Abscess in case of staphylococcic pneumonia Masses of bacteria in the abscess

lococcus albus and once *Staph. citreus* either alone or as the majority of the cultured organisms

The clinical signs indicated that a large proportion of the patients had an infection of the upper part of the respiratory tract before the staphylococcic pneumonia developed. The high incidence of this type of pneumonia in children and the frequently associated empyema are borne out by this series of cases. It supports Cohen,⁸ who believes that the most common cause of empyema in infants below 6 months of age is the *Staph. aureus*. It also supports Menten, Bailey, and De Bone,¹¹ who claim that *Staph. aureus* seems to have a propensity for inducing disease in infants that is not so evident in adults. However, I think that we must also consider the bacterial flora of the throat in newborns and infants.

Throat cultures of a series of 65 normal newborn babies up to 10 days of age were studied, and I found that 35 per cent of the babies showed a varying number of *Staph. aureus*. This is a much higher incidence than that reported by Shibley, Hanger, and Dochez¹² for a series of adults. This higher incidence of *Staph. aureus* in the throat of newborns may explain to some extent the relative frequency of staphylococcic pneumonia in newborns

and infants as compared to that developing in adults. Out of the 38 cases upon which this study is based, 19 cases, 50 per cent of the entire series, occurred in infants below 6 months of age.

Throat cultures taken before death from 7 patients revealed in 5 of them *Staph. aureus* as the predominating organism. This is confirming Chickering and Park³ who suggested that the staphylococci invading the lung come from those residing normally as saprophytes in the secretions of the upper part of the respiratory tract. Woodward¹³ considers the staphylococci not simply as saprophytes in the upper part of the respiratory passages but as potential pathogens of these regions. Accordingly, it would seem that when staphylococci are present in the sinuses or in the throat they are a potential menace to bronchi and lungs.

Histologic sections of lungs from newborns with staphylococcic pneumonia showed frequently aspirated, large epithelial cells and mucus in the alveoli and in some of the bronchi. Masses of staphylococci could be seen on the surface of the mucus in some cases. Therefore, it seems to me that staphylococcic pneumonia in newborns is frequently due to aspiration of mucus from the throat which harbors *Staph. aureus* in a fairly high per-

FIG 8 Histologic appearance of staphylococcal lobar pneumonia. It is almost identical with that caused by pneumococci.

centage of newborns. However, an exogenous infection is also possible. For instance, Gasul and Singer⁶ thought that the aspiration of contaminated material may have been responsible for the staphylococcal lung infection in their case. Glaser⁷ suggested the possibility of infection introduced by tracheal catheter or by some other trauma to the respiratory apparatus. Smith¹⁴ reported a small epidemic of *Staph. aureus* pneumonia among infants in a Glasgow maternity hospital. The epidemic followed cases of mastitis and skin infections in the same ward.

Aspiration staphylococcal pneumonia occurs also in children and adults. Bronchopulmonary exudates infected with *Staph. aureus* may be dangerous in this respect, as the aspiration of staphylococcal pus will cause a fulminating hemorrhagic bronchitis with hemorrhagic pneumonia. In such a case of this series the fulminating infection followed bronchoscopy, and the patient died in a cyanotic attack a few hours after that procedure. Her face turned cyanotic and finally almost black. In another case the cauterization of a large lung abscess cavity was followed by fulminating staphylococcal pneumonia. Very

probably, aspiration of *Staph. aureus* from the nose and throat was responsible for the fulminating staphylococcal sanguinopurulent bronchitis and hemorrhagic lobular pneumonia which almost immediately followed a swim and caused death of a 3½-year-old girl forty-eight hours later. At the postmortem of this case the bronchogenic character of staphylococcal pneumonia was strikingly demonstrated and showed the great damage the *Staph. aureus* can do in the tracheobronchial mucosa within a short time.

The bronchogenic nature of staphylococcal pneumonias was fairly evident in the entire series of cases. Abscesses were formed in about one-half of the series. Culture of the abscesses yielded many times only pure growth of staphylococci. This observation and that of others seems to be somewhat contrary to the experimental findings of Mc Cordock and Muckenfuss¹⁰ who were able to produce lung abscesses only if the staphylococci were injected together with vaccine virus into the lungs of rabbits.

In order to see experimental lung lesions produced by *Staph. aureus* in rabbits, a series of fourteen rabbits was injected intratrache-

FIG 7 Abscess in case of staphylococcic pneumonia. Masses of bacteria in the abscess

lococcus albus and once *Staph. citreus* either alone or as the majority of the cultured organisms.

The clinical signs indicated that a large proportion of the patients had an infection of the upper part of the respiratory tract before the staphylococcic pneumonia developed. The high incidence of this type of pneumonia in children and the frequently associated empyema are borne out by this series of cases. PERIRENAL AND SUBPHRENIC INFECTIONS

JOHN H. POWERS, M D, Cooperstown, New York

THE purpose of this paper is to present two small groups of cases in which early diagnosis is both rare and difficult—cases which have many etiologic features and clinical characteristics in common and which, even at operation, may occasionally be difficult to allocate definitely to the province of urology or general surgery. I refer to inflammatory lesions around the kidney and beneath the diaphragm.

During the past nine years 20 such patients have been studied at the Mary Imogene Bassett Hospital. Twelve were classified as cases of subdiaphragmatic abscess, 5, as perirenal, and 3 were difficult to place with certainty in either category. Because of the history of the disease and the nature of the infecting organism, 2 of these last were regarded as primarily perirenal and 1 was classified as subdiaphragmatic.

Pathogenesis

The etiology of perinephritic and subphrenic infections is an interesting subject. Both spaces are susceptible to infection by the same methods: (1) by direct extension from an abscess in an adjacent organ or by intra- or retroperitoneal gravitation of pus from a suppurative process elsewhere in the abdomen, and (2) by metastatic invasion from a distant, frequently superficial focus, either through the blood stream or the lymphatic system.

In 1910 Miller¹ discussed the anatomy of the kidney and perinephrium and called attention to the continuity, through the lateral lumbar chains, between the lymphatics of these structures and those of the posterior abdominal wall, the lower urinary tract, the pelvic organs, the external genitalia, and the lower extremities. While admitting that some perinephritic abscesses start from an adjacent diseased kidney, he believed that these did not comprise more than one-quarter of the total number and held that the more common type was due to infection from the drainage area below the kidney or to hematogenous invasion. More recently, Vermooten² has analyzed the postmortem records of 26 cases of staphylococcic bacteremia and septi-

cemia in which multiple cortical abscesses were found in both kidneys, only 1 of which had ruptured into the perirenal tissues. He concluded that "the occurrence of an acute suppurative perinephritis secondary to bacterial staphylococcal emboli in the end arteries of the perinephrium is a definite disease entity and need have no relation whatever to the kidney except for the fact that the perinephrium happens to surround that organ."

In contradistinction to this opinion there are many eminent authorities³⁻⁶ who believe that perinephritic abscess of (so-called) extra-renal origin is the result of blood-borne infection to the renal cortex, followed by one or more cortical abscesses with extension therefrom to the perirenal tissue.

I am in complete accord with the belief that invasion of the perinephrium by this method may occur. I do believe, however, that the absence of urinary symptoms in most of these patients, the absence of pus and bacteria in the urinary sediment, the frequent nonexistence of any demonstrable renal lesion at operation, the great facility with which bacteria may pass through the kidney without detention, the frequency of suppurative renal lesions without perinephritis, and the fact that the perinephrium has its own vascular and lymphatic systems all suggest that metastatic perirenal abscess may occur without any intervening abscess of the renal cortex.

In the two groups herein reported, 5 of the 7 cases of perirenal abscess were metastatic in origin, secondary to superficial cutaneous foci.

Subdiaphragmatic abscess, on the other hand, is nearly always due to rupture of an adjacent organ, gravitation of septic material from a perforated or leaking noncontiguous viscus or to lymphatic extension from a more distant intra-abdominal focus. In a recent review of 3,608 collected and personal cases Ochsner and DeBakey⁷ found 72.2 per cent secondary to disease of the appendix, stomach, duodenum, liver, and bile passages.

Ten of the 13 cases of subphrenic abscess in my series were due to direct or lymphatic extension from perforations or inflammatory lesions of these same organs. Two patients with perirenal and 1 with subdiaphragmatic

ally with *Staph aureus*. A 5-cc saline suspension of a twenty-four-hour growth of hemolytic *staphylococcus aureus* (2,500 million organisms per cubic centimeter) was injected into each rabbit. One rabbit was killed every day up to the twelfth day, then one on the sixteenth and one on the twentieth day. The rabbits developed tracheitis, bronchitis, and bronchogenic lung infection similar to that observed in human lungs. The infection did not kill the rabbits. The initial hemorrhagic consolidations were followed by small and large gray consolidations and small abscesses seen under microscope. The consolidations involved one-third to one-half of each lung. *Staphylococci* were recovered from the lungs in pure culture up to eight days after injection. After that day the lung cultures became completely negative. Masses of *staphylococci* were seen in the lungs under the microscope during the first day after the injection and disappeared gradually. The small abscesses became absorbed later on, and by the twentieth day one was able to see only congestion, some fibrosis, and the final stages of repair. Although the rabbit lung appears to possess better resistance to *Staph aureus* than does the human lung, nevertheless it demonstrates that *Staph aureus* can cause bronchogenic pneumonia and small abscesses without the association of any other organisms or virus.

Treatment consisted mainly of giving oxygen therapy and of general supportive measures. Specific treatment was given only in 2 cases in which pneumococci were also present in small numbers. Sulfanilamide was used in 1 case without any notable effects. Cecil and co-workers¹ found no evidence that sulfa-pyridine was of any benefit in staphylococcal pneumonia. Sulfamethylthiazole has not been tried out as yet in staphylococcal pneumonia. However, some other serious staphylococcal infections were apparently cured by this new drug which may bring a ray of hope for the more successful treatment of staphylococcal pneumonia.

Summary and Conclusions

1 Primary staphylococcal pneumonia is bronchogenic and it is more common than generally thought.

2 One hundred and forty-four cases of fatal lobar and bronchopneumonias were autopsied during seven years at the Rochester General Hospital. Thirty-eight of these were caused by *staphylococci* either as the only bacterial agents or as the predominating

organisms. About two-thirds of the staphylococcal pneumonias occurred during the first decade of life.

3 Staphylococcal pneumonia usually followed upper respiratory disease, but this was not always the pattern.

4 The gross anatomic appearance was not always that of a bronchopneumonia with or without abscesses, but in several instances it was that of typical lobar pneumonia. In newborn babies staphylococcal pneumonia often appeared as hemorrhagic lobular or lobar pneumonia. Throat cultures and sputum examinations showed *staphylococci* as the predominating organisms in several cases in which the presence of *staphylococci* was reported.

5 A series of rabbits was injected intratracheally with saline suspension of hemolytic *staphylococcus aureus*. Pneumonia was produced, and, in addition, small abscesses developed in the lungs. However, the abscesses disappeared gradually and the entire infection healed if the rabbits were examined only about three weeks after the injection.

6 The study of throat cultures should be extended to include the *Staph aureus* in cases of infections of the upper part of the respiratory tract, in pneumonias, and in patients to be worked up for bronchoscopy and lung operations. Detection of *staphylococci* in large numbers may be of value in establishing the etiology of atypical cases. It may also be a warning and, perhaps, complications and high mortality can be reduced in the future.

* Six patients developed a subdiaphragmatic abscess while in the hospital and are not included in this tabulation

abscess gave no history of antecedent infection (Table 1)

Symptomatology

The nonspecific character of the onset of both perirenal and subdiaphragmatic abscess, the insidious nature of their development, and the difficulty of making an early diagnosis are well manifest in many cases by the long interval of time which frequently is allowed to elapse between the initial symptom of the disease and hospitalization of the patient. In these two groups the patients with perinephritic infection had been ill for an average period of six weeks each, and those with subphrenic lesions had had vague symptoms for three months before admission to the hospital (Table 2)

In truth, there is no characteristic initial symptom or train of symptoms that is pathognomonic of either disease. Fatigue, malaise, anorexia, and fever are frequent among the early complaints. Pain is occasionally the first symptom, but its location in no way serves to distinguish one type of infection from the other. Cough, when present, is suggestive of subdiaphragmatic irritation. However, a cough so troublesome and per-

sistent that it was diagnosed and treated by several physicians as pertussis was the first, in fact for several weeks the only, symptom of 1 patient in this group who had a small perirenal abscess secondary to a carbuncle of the kidney

As the diseases develop the patients lose weight and strength. Fever of the septic type is present and may be characterized by high peaks, each of which is not infrequently preceded by chilly sensations or an actual shaking chill. Nausea, vomiting, and generalized abdominal pain are common. With increase in the size of the inflammatory mass the pain is prone to localize in the upper abdominal quadrant, in the flank, or in the lumbar region. Pain in the shoulder synchronous with respiration or accentuated by deep breathing is suggestive of a subdiaphragmatic lesion. Dyspnea also is common when the abscess is situated in this region. Urinary symptoms in cases of true perinephritic abscess are infrequent.

Physical Signs

As is true of the subjective symptoms, so is it also of the physical signs—there are no distinguishing characteristics that are pathognomonic of either perirenal or subdiaphragmatic abscess. Early in the course of a developing infection in either region, the signs may be entirely absent or quite misleading. If the abscess is located on the right side, tenderness in the lower abdominal quadrant may be so marked that appendicitis is suspected and an operation performed.

Frequently, the physical signs vary from day to day and even from hour to hour. Tenderness in a given area may be quite marked in the forenoon and completely absent in the evening of the same day.

Actually the most helpful late diagnostic sign among the patients in this series with perirenal abscess was a tender mass in the hypochondrium and flank. Such a tumor was present in 6 of the 7 cases, was commonly visible as well as palpable, frequently descended slightly with deep inspiration, and was formed by the abscess itself, by the kidney, or by both (Fig 1). However, a comparable mass was present in 1 patient with a large collection of pus beneath the diaphragm which had displaced the kidney downward and laterally (Figs 1 and 2). Consequently, such a tumor, while suggestive, affords neither constant nor positive evidence of perirenal abscess.

Tenderness in the flank is a frequent char-

TABLE 3—ANALYSIS OF DEATHS AND SUMMARY OF THE PATHOLOGIC DIAGNOSES IN THE FATAL CASES

Case	Location of Abscess	Contributing Factors	Autopsy
7	Perirenal	Carbuncle of kidney	No
13	Subdiaphragmatic	Ulcer of rectum, abscess of liver perforation of diaphragm empyema of pleura, right	No
14	Subdiaphragmatic	Carcinoma of gallbladder, secondary carcinomas of liver multiple abscesses of liver intraperitoneal abscess intracranial hemorrhage	Yes
15	Subdiaphragmatic	Multiple abscesses of liver	Yes
16	Subdiaphragmatic	Chronic cholecystitis, cholelithiasis calculus in common duct ulcer of duodenum local peritonitis serofibrinous pleurisy abscess of abdominal wall	Yes
17	Subdiaphragmatic	Large ulcer of duodenum with perforation beginning gangrene of lower lobe of lung right serous pleurisy, right	Yes
18	Subdiaphragmatic	Diaphragm of duodenum general peritonitis fibrinous pleurisy, right hydrothorax bilateral	Yes
19	Subdiaphragmatic	Carcinoma of stomach local peritonitis fibrinous pleurisy, right, broncho-pneumonia bilateral	Yes

even secondary to small subcapsular cortical abscesses

Treatment and Results

All 7 patients in the group of perirenal abscess were operated on, 6 recovered. The infection in each instance was due to *Staphylococcus aureus* and in none of these cases was there any demonstrable lesion of the kidney. Honeycombing of the edges of the wound with small staphylococcal abscesses was a frequent postoperative complication. In the seventh case, drainage of what was strictly a perinephric abscess secondary to a localized renal carbuncle was followed by total infarction of the kidney and death (Table 3, Case 7).

Drainage in all cases was performed retroperitoneally through a transverse lumbar incision. There is no indication for any other approach.

Drainage of the subdiaphragmatic area was performed in 5 uncomplicated cases of subphrenic abscess. All the patients recovered. A two-stage transthoracic approach was used twice, a one-stage transthoracic approach entering the abscess through the diaphragm below the pericardium after resecting the costal cartilages of the left fifth, sixth, and seventh ribs was used once, a transperitoneal approach, once, and a retroperitoneal lumbar approach, once.

In 6 cases of subphrenic abscess the diagnosis was not made before death, 3 of these (Table 3, Cases 15, 16, and 17) were discovered at autopsy, 2 were early collections of pus beneath the diaphragm incidental to postoperative peritonitis (Cases 18 and 19), and 1 was operated on for a complicating intraperitoneal abscess (Case 14). In 1 case (Table 3, Case 13) catheter drainage of the pleura was done after an unsuspected subphrenic abscess had ruptured through the diaphragm, the patient died. One patient in the group was not seen during the acute phase of the disease. Ochsner and DeBakey⁹ and also Hochberg¹⁹

have emphasized the great importance of draining subphrenic abscesses extraperitoneally and have pointed out the impressive reduction in mortality they observed after eliminating trans-serous routes of approach. In the personal series of Ochsner and DeBakey the mortality for transpleural drainage was 50 per cent, for transperitoneal, 42.8 per cent, and for extraserous, 10.8 per cent.

Conclusion

Perirenal or subdiaphragmatic abscess should be suspected in all cases of protracted sepsis with fever and leukocytosis when there is an antecedent history of furuncles, superficial infection, or inflammatory lesions of the intra-abdominal or pelvic viscera. Early signs of localization are frequently vague, inconspicuous, and unconvincing. As the abscess develops, differential diagnosis becomes less difficult. The results of proper operative treatment are excellent. The mortality in late cases with complications is high.

FIG 2 CASE 8 Pyeloureterogram illustrating displacement of the kidney downward and laterally by subdiaphragmatic abscess above

acteristic of perinephritic infection, but it may vary from time to time in the same patient and may also be present in cases of subphrenic abscess. Tenderness in the costo-vertebral angle—a sign regarded by some authors as pathognomonic of perirenal abscess—was absent in 2 patients with this lesion and present in 3 of those with collections of pus beneath the diaphragm. Tenderness to deep palpation in the epigastrium or in the hypochondrium just below the costal margin is occasionally the only positive early local evidence of a subphrenic abscess. Deep discomfort may be elicited by heavy percussion over the lower thoracic wall, anteriorly and posteriorly, when a collection of pus lies either beneath the diaphragm or around the kidney.

Spasm of the muscles of the abdominal wall, flank, and paravertebral group is extremely variable and frequently absent.

Edema of the skin and subcutaneous tissues of the flank, the lumbar region, or the lower thoracic wall is observed occasionally and, when present, is indicative of underlying infection.¹⁰

Abnormal physical signs in the chest over

the base of the adjacent lung may lead to the erroneous diagnosis of intrathoracic rather than intra-abdominal disease. Dexter¹¹ has reported 6 cases of subphrenic abscess in all of which he found dullness, diminished breathing, and diminished or absent fremitus on the affected side, adventitious sounds pointing to involvement of the pleura or lung were noted in 5 of the 6 cases. Such abnormal findings are also not uncommon when a large abscess surrounds the upper pole of the kidney.

Additional Diagnostic Data

Chinopathologic studies are of no value in establishing a differential diagnosis between these two types of cases. The temperature and pulse rate are invariably elevated in both. The level of hemoglobin and the erythrocytic count frequently indicate some degree of secondary anemia. Leukocytosis of varying range is always present. Routine examination and culture of the urine are seldom of significance except as a differential aid in ruling out primary disease of the kidney.

Roentgenologic examinations occasionally afford useful diagnostic assistance. Spinal scoliosis, convex to the opposite side, and obliteration of the psoas shadow have been described by Beer¹² and Carty¹³ as suggestive of perirenal abscess. These signs are frequently absent. Elevation and fixation of one side of the diaphragm, the presence of an underlying bubble of gas, and a fluid line that shifts with change in the position of the patient are regarded by Whipple,¹⁴ LeWald,¹⁵ O'Brien,¹⁶ and McNamee¹⁷ as important aids in the diagnosis of subphrenic infection.

However, in 1 case herein reported I removed 500 cc of pus from beneath a diaphragm that moved normally by fluoroscopic examination, and I have also seen elevation and fixation of the diaphragm in 1 patient with a large perirenal abscess. This same phenomenon has also been observed by Braasch.¹⁸ It therefore seems wise to offer a word of caution about the significance of roentgenologic examinations; they may be extremely helpful but upon occasion may also be misleading and should be interpreted in the light of the previous history and positive physical signs.

Special urologic procedures, cystoscopy, ureteral catheterization, and retrograde or intravenous pyelograms are of value in differential diagnosis when inherent disease of the kidney is suspected, but they afford no assistance when the perinephritic abscess is primary or

Additional Diagnostic Data

Chemopathologic studies are of no value in establishing a differential diagnosis between these two types of cases. The temperature and pulse rate are invariably elevated in both. The level of hemoglobin and the erythrocytic count frequently indicate some degree of secondary anemia. Leukocytosis of varying range is always present. Routine examination and culture of the urine are seldom of significance except as a differential aid in ruling out primary disease of the kidney.

Roentgenologic examinations occasionally afford useful diagnostic assistance. Spinal scoliosis, convex to the opposite side, and obliteration of the psoas shadow have been described by Beer¹² and Carty¹³ as suggestive of perirenal abscess. These signs are frequently absent. Elevation and fixation of one side of the diaphragm, the presence of an underlying bubble of gas, and a fluid line that shifts with change in the position of the patient are regarded by Whipple,¹⁴ LeWald,¹⁵ O'Brien,¹⁶ and McNamee¹⁷ as important aids in the diagnosis of subphrenic infection.

However, in 1 case herein reported I removed 500 cc of pus from beneath a diaphragm that moved normally by fluoroscopic examination, and I have also seen elevation and fixation of the diaphragm in 1 patient with a large perirenal abscess. This same phenomenon has also been observed by Braasch.¹⁸ It therefore seems wise to offer a word of caution about the significance of roentgenologic examinations, they may be extremely helpful but upon occasion may also be misleading and should be interpreted in the light of the previous history and positive physical signs.

Special urologic procedures, cystoscopy, ureteral catheterization, and retrograde or intravenous pyelograms are of value in differential diagnosis when inherent disease of the kidney is suspected, but they afford no assistance when the perinephritic abscess is primary or

outside Gerota's fascia are paranephric or false perinephritic abscesses, whether subphrenic, along the psoas, or postperitoneal from appendicular phlegmon, etc. As Dr Powers has indicated, the usual etiologic factors are quite distinct. The perinephric abscess arises first as a metastatic lesion—blood born from distant foci such as furunculosis, wound and bone infections, diseases of the upper part of the respiratory tract, second, by direct extension from a recent or chronically infected kidney. Rarely direct or lymphatic extension from appendiceal or other inflammatory areas may be causative. Subphrenic and other false perinephritic abscesses are due almost invariably to the direct or lymphatic extension of intra-abdominal, suppurative processes concerned with the appendix, stomach, duodenum, gallbladder, etc.

Most, if not all, perinephritic abscesses are secondary to renal involvement and to label them primary is somewhat confusing. Contrary to Dr Power's observations, in our acute cases due to staphylococcal organisms where it seemed feasible and safe to adequately explore the kidney, cortical abscesses of varying size and number were found in every instance. The symptoms and signs of subacute focal staphylococcal nephritis, cortical abscess, and perinephritic abscess parallel each other so closely that their differentiation is often impossible save as clinical improvement or operative intervention reveals the real condition. It seems to me that all three depend on the same hematogenous spread of pyogenic bacteria to the renal parenchyma. The severity of the resultant lesion depends on the local and general resistance.

As Dr Powers' cases show, simple incision and drainage usually completely cures this type of abscess, the exception being with the coincident fulminating pyemic kidney, such as was encountered in his 1 fatality.

In the more chronic forms, urinary tract infections of varying duration with pus in the urine and renal symptoms usually antedate the onset of the abscess. The primary kidney lesion may be a simple pyelonephritis, infection with stone, pyonephrosis, polycystic kidney disease, or tuberculous, and the formation of an abscess constitutes an exacerbation of the primary disease. The exciting organisms are commonly of the colon group or mixed types rather than the pyogenic cocci as a result of the underlying renal damage. In these more chronic cases the mortality and morbidity are much greater than in those of the acute or subacute staphylococcal variety. In a considerable percentage of cases, primary nephrectomy is required. In others, a persistent sinus tract or progressive renal destruction makes secondary nephrectomy necessary.

The diagnosis of perinephritic abscess depends entirely on the history and physical findings, but positive x-ray findings may also be helpful. The classic symptoms of pain in the renal area,

accompanied by fever, malaise, leukocytosis, tenderness, varying muscular rigidity over the affected side, tenderness at the costovertebral angle, presence of fullness or an indistinct mass in the flank with x-ray findings of renal fixation, haziness in the kidney outline, obscuration of the edge of the psoas, together with curvation of the spine with the concavity toward the infected side, give a rather clear picture of the condition. In other instances the only symptoms may be those of prolonged sepsis and malaise with few localizing signs and no urinary symptoms. The differential diagnosis of subphrenic and perinephritic abscess may be difficult. The history and diagnostic signs of antecedent intra-abdominal disease, together with the x-ray findings outlined by Dr Powers, may give a clue to the pathology present. Although on three occasions I have mistaken subphrenic or psoas abscess for perinephritic suppuration, my experience with the former is somewhat limited. The majority of these patients are seen by general surgeons, the abscess often complicating previous abdominal surgery.

A recent complicating factor in the diagnosis of perirenal suppuration has been the use of sulfanilamide or related drugs for unexplained fevers without a clear diagnosis preceding the prescription. Recently the fever, localizing symptoms, and pain were alleviated in 1 patient by the use of neoprontosil and a second patient with sulfanilamide. The patients were allowed to leave the hospital with a diagnosis, respectively, of cholecystitis and gastrointestinal "flu." Both patients were readmitted subsequently after the lapse of several weeks with more certain signs and were operated upon for relief of staphylococcal abscess.

I have the x-ray findings in these 2 patients with some further cases where the x-ray was helpful.

Case 1—B. R., a young woman, aged 24, was readmitted two weeks after a previous diagnosis of cholecystitis. The urine specimen from the right kidney showed a few scattered pus cells, and staphylococci were found in the smear. The films show obscuration of the right psoas edge with some incurvation of the spine toward the right, the pyelograms being unremarkable. Operative intervention revealed an abscess in the perinephric area associated with a cortical abscess occupying about one-quarter of the lower aspect of the cortex.

Case 2—D. P., a child, aged 9, had an infected wound of the knee three months previously. The patient was admitted to the hospital where the septic course was interrupted by the use of neoprontosil. There was slight tenderness in the left costovertebral angle and anteriorly over the left kidney. No other physical signs were noticed except for some diarrhea and gastrointestinal upset. The intravenous pyelogram was not remarkable, although the terminal cycles were not well filled. The patient was discharged with a normal temperature, returning four weeks later when the flat film of the ab-

Discussion

Dr Leo E Gibson, *Syracuse, New York*—Dr Powers has presented two very interesting groups of cases. He has been fortunate in having the opportunity to study so large a series of subphrenic abscess. I should like to ask if, in his cases, the abscesses were found intraperitoneally as in the majority described by Ochsner.

In all the discussions of perirenal infection one is somewhat surprised at the variety of terminology and different views about its etiology. Symptoms indicating suppuration in or around the renal cortex denote to many only perinephritic abscess, regardless of the possible presence of renal carbuncle, multiple cortical abscesses, or perinephritic abscess. Pathology in these lesions is quite different. Likewise, some, and I think the majority, voice the conviction that perinephritic abscess is almost invariably the result of a blood-stream infection of the renal cortex resulting in a cortical abscess which, after all, may be of little significance but which breaks through the capsule of the kidney and produces a perinephritic abscess. There are others who agree with Vermooten that the abscess develops independently of any pathology in the kidney.

It is difficult to prove either contention. Exploration of a kidney through a perinephritic abscess is difficult and dangerous. Cortical abscesses readily heal after draining into the perirenal space. Any evidence of their presence is obscure. The majority of cases are diagnosed only after several weeks of illness, consisting usually of an unexplained pyrexia. If an early diagnosis could be made and a prompt exploration carried out, I think more evidence of subacute blood-stream infection of the kidney cortex would be found. The question appears to be of academic interest only, while the diagnosis and treatment are of first importance.

There is considerable discussion in regard to the diagnostic value of the various clinical signs and symptoms exhibited by these lesions. No generally accepted solution has been arrived at regarding these factors.

Regardless of the confusion in the diagnosis and the vagaries in the clinical picture, a diagnosis of perirenal infection can be more accurately made if we have the luck to think of it. Certain factors are then searched for and usually found. A complete history is of the greatest importance.

In a series of 20 cases recently studied, 14, or over 65 per cent, presented a history of peripheral infection such as infected wounds, osteomyelitis, furunculosis, either by itself or complicating diabetes, paronychia, and acute infections of the upper part of the respiratory tract. These focal infections may occur five to twelve

weeks preceding the onset of symptoms referable to the kidney lesion. Lesions of this type may entirely heal and be forgotten by the patient. Only careful questioning will bring them to light. Two cases were operated upon, and a cortical abscess was discovered which I am sure would have drained into the perirenal space. Four cases revealed definite deformity in the retrograde pyelogram caused by large cortical abscesses. In 2 cases there was a remission of all the symptoms, during which time the patient appeared entirely recovered and refused surgery. Later, a perinephritic abscess developed. I think cortical abscesses were present which drained into the perirenal space, temporarily relieving the pain and tenderness that returned on development of the perinephritic abscess. In 10 cases the psoas muscle shadow was definitely obliterated, and in practically all of the cases scoliosis was present to some degree. One case had been confined in a sanatorium as tubercular, due to the mimicry, by the abscess, of the lesion of the lung. One case had a fixation of the thigh due to reflex contraction of the psoas muscle. In the majority of the cases a few pus cells were found in the urine, and in about 50 per cent of the cases staphylococci were recovered on culture of the urine. Fixation of the kidney or reduction of function, as may be shown in the intravenous pyelogram, was of no material aid in the diagnosis of these cases. In 1 case the abscess was massive and surrounded the upper pole of the kidney, but it was not considered a subphrenic abscess. In considering subphrenic abscess as being located intraperitoneally or immediately beneath the diaphragm and above the liver in the majority of cases, the provisional diagnosis of such a lesion offered no confusion in this series.

The studies of Ochsner and others revealed that 85 per cent of subphrenic abscesses are complications of intra-abdominal suppurated processes and that 50 per cent of those occurring are secondary to operative lesions of the appendix. This history is as important as that of peripheral infection preceding subacute blood-stream infection of the cortex of the kidney. The history of intra-abdominal lesions in so large a percentage of subphrenic abscesses apparently places its treatment in the realm of abdominal surgery rather than urology.

The diagnosis of these lesions is interesting, but it is evident that it depends upon a correlation of all the factors in the case at hand. There is no definite pathognomonic symptom.

Dr L. B. Kungery, *New York City*—It has been a great pleasure to hear the interesting and instructive paper presented by Dr Powers. It seems logical to limit the term "perinephritic abscess" to pus accumulated within the loose, areolar tissue surrounding the kidney and enclosed by Gerota's fascia (the true perinephrium). Other accumulations near the kidney but

ERUPTIONS OF PREGNANCY

MAURICE J. COSTELLO, M D , New York City

THE pregnant woman is subject to all the dermatoses that occur in the nonpregnant woman. However, a woman is more likely to suffer from certain eruptions due to the physiologic burden of gestation. These dermatoses have been ascribed to diminished hormonal activity or excessive stimulation of the endocrines. Several dermatoses occur almost exclusively in the prepartum period. Chronic eruptions existing prior to pregnancy may be either ameliorated or aggravated during the time of gestation. Women who suffer from eruptions at the time of menstruation are more likely to develop skin diseases when pregnancy occurs. This is evidenced by the fact that herpes simplex, hyperpigmentation of the skin, pruritus, and urticaria are occasionally observed during both periods.^{1,2}

The eruptions associated with pregnancy and the puerperium may be arbitrarily divided into those that are endocrine in nature, being due either to a diminution or to an increase in the anterior pituitary sex principle, and those that are toxic and neurogenic. Dermographia alba and rubra, generalized pruritus, urticaria, prurigo gestationis, herpes gestationis, impetigo herpetiformis, pruritus vulvae et ani, fibroma molluscum gravidarum (papiloma colli) are the cutaneous manifestations that are probably of endocrine causation.

Pigmentary changes during gestation are also due to an endocrine derangement. These include physiologic hyperpigmentation of the genitals, the umbilicus, the face (chloasma), the linea nigra, and the secondary areolas of the breasts. Depigmentation, as guttate leukoderma and vitiligo, are rarely seen.

Edema, flushing, hyperhidrosis, hypertrichiasis, palmar and plantar telangiectasia, subcutaneous hemangio-endotheliomas, erythema multiforme, and changes in the appendages (hair and nails) may be due to disturbances of the vascular mechanism. This may be caused by toxic or endocrine excitation of the vegetative nervous system.

Chronic proliferative gingivitis, purpura, and other eruptions to which a vitamin deficiency contributes will be discussed later.

Generalized urticarial cutaneous manifestations are not rare in the latter part of

the antepartum period. Dermographia alba and rubra were observed in about 75 per cent of the pregnant women examined by Seitz.¹ The normal vasomotor mechanism of the cutaneous vessels is disturbed. Sergeant thinks that dermatographic alba is caused by an inadequate supply of epinephrine, which renders the vessels of the skin more permeable.¹ The escape of serum probably explains the elastic puffiness of the features of many pregnant women.

Pruritus that occurs in the latter half of gestation is probably the most frequent cutaneous affection of pregnancy. It is often generalized, although it may be localized to certain areas—as the vulva and anal regions. Oftentimes there are no objective symptoms in either type. Occasionally, the linear parallel excoriations are severe enough to suggest pediculosis corporis. In the localized type especially, the urine and blood should be examined for sugar to rule out diabetes mellitus. Since varicose veins are occasionally the indirect cause of pruritus vulvae, they should be considered as one of the many etiologic possibilities.³ Anogenital pruritus may be associated with vaginitis, edema of the vulva, and leukorrheal discharge. Examination for the *Trichomonas vaginalis* is important. Bland found this parasite in 7 per cent of 300 pregnant women examined.⁴ *Trichomonas vaginitis* may be accompanied by intertriginous eczema resulting from leukorrheal discharge and scratching. These inflamed parts may harbor virulent organisms and be the cause of puerperal infection.⁵ Pruritus vulvae et ani may be mycotic in origin, being caused by the *Monilia albicans* or other yeastlike organisms and the *Epidermophyton*. Burning sensations and itching are common symptoms of this infection. The anogenital areas present a moist erythematous eruption with demarcated borders made up of overhanging epidermis. The epidermis on the labia is thickened and grayish white. The monilia infection may be primary or secondary to infection of the vagina or intestinal tract. Tinea cruris caused by the *Epidermophyton inguinale*, although sharply demarcated and with an elevated border, is dry, scaly, and fissured.

Generalized pruritus and nonmycotic anogenital pruritus are explained on the endo-

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 8, 1940.

domen was taken. This shows the scoliosis of the spine, with the concavity toward the left side and some obscuration of the psoas edge compared with the right side despite the marked amount of gas present.

Case 3—J. R., a child, aged 8, gave a history of only two days pain in the upper right quadrant. On admission there was acute tenderness in the right upper quadrant and in the right side and a suggestion of fullness in this region. An intravenous pyelogram taken on the day of admission shows failure of the middle and minor calices to fill with little detail in this area. Three days later a flat film of the abdomen showed obliteration of the right psoas shadow, lumbar scoliosis with concavity toward the right, together with indefinite renal outline in the lower portion. Operation revealed a perinephric abscess with a small cortical abscess on the anterior surface, lower pole of the kidney.

Case 4—G. K., a woman, aged 20, was admitted complaining of dragging pain in the right loin of five weeks' duration. Several days prior to the onset she had had an abscess in the right buttock. She had been observed in another hospital for two weeks and discharged without a diagnosis. Physical examination showed tenderness in the right loin and costovertebral angle. Anteriorly, there was a movable, slightly tender mass the size of a grapefruit, apparently connected to the kidney. An intravenous pyelogram showed some obscuration of the edge of the psoas with no spinal curvature. A double kidney on the right side was seen, with a distinct circumscribed area of increased density surrounding the lower portion of the right kidney and having the appearance of an abscess. Operative intervention revealed a perinephric abscess with a small cortical lesion on the posterior lower pole of the kidney.

Case 5—J. N. The films serve to indicate the occurrence of a perinephric abscess extending from previously infected kidneys. The patient had polycystic kidney disease with double

pelvis on the left side. The first films show the clear outline of the enlarged kidneys, while the pyelogram indicates the irregularity in the uppermost calices and poor filling in the lower pelvis on the left side. Subsequent films showed obscuration of the left psoas edge with an indistinct outline of the upper pole of the kidney—the site of a perinephric abscess which was opened. The infecting organism was the *Bacillus aerogenes lactis*, the same as cultured from the urine. A few weeks later he developed symptoms of pain and tenderness on the right side. Films taken at this time showed obliteration of the right psoas edge with rounded area of increased density overlying the lower pole of the right kidney and obscuring its outline. This second abscess was drained, and the patient was discharged with wounds healed. In 1939, four years later after incision and drainage of these bilateral perinephric abscesses, the patient was readmitted with a painful swollen area in the upper portion of the left incision. The abscesses had recurred, and an irregular-shaped stone had developed in the upper part of the pelvis on the left side. At operation the perinephric abscess was incised and drained, and the calculus was removed by nephrostomy through the upper pole. The patient recovered and was discharged on the thirty-second postoperative day, with a small sinus still persisting in the upper portion of the incision. He was readmitted in April, 1939, with the sinus still draining and recurrent stone at the same site where the calculus had previously formed. He was discharged after a week of treatment in the hospital but was readmitted in October, 1939, with a recurrence of an extensive abscess in the same area about the upper pole of the left kidney. This patient serves as an extreme instance of the complications that may follow perinephric abscess when associated with seriously damaged and infected kidneys. It forms a striking contrast to the acute staphylococcal metastatic type where incision and drainage are followed by prompt cure and with no evident gross renal damage.

FOUR RELAPSES OF PNEUMONIA IN SAME PATIENT

The unusual occurrence of a patient suffering four relapses of pneumonia, due to four different types of pneumococci, all within a period of fifty days, is reported in the *Journal of the American Medical Association* for March 1 by Drs. Edward Bigg and Roger A. Harvey, Chicago, who state that recurrent attacks of pneumonia are extremely common but that a relapse is rare.

They define relapse as an affection of the same

or different lobe of a lung a few days after the original infection has subsided. In contrast to this, a recurrence can take place years after the first illness.

The authors stress the importance of repeated laboratory studies of the sputum for the identification of the pneumococci in possible cases of relapse so that appropriate serum and drug treatment can be given.

The Society for Psychotherapy and Psychopathology of New York has appointed a committee headed by Dr. Bernard Glueck to arrange for the publication of one or more of the books of the late Dr. Paul Schilder. Contributions to make such publications possible may be sent to the secretary of the committee, Frank J. Curran, M. D., 404 E. 55th Street, New York City.

They were discussing a certain undefeatable and irresistible politician. "Well," summed up the smoke room philosopher, "I'll tell you this about him. He might have typhoid, and recover, he might have pneumonia, and recover, he might have yellow fever, and recover, but—if he ever had lockjaw, by g—d, sir, he'd burst!"

—Medical Record

and extensor surfaces of the extremities become involved. Later the eruption may become generalized, affecting the face, back, and buttocks. As a rule there are no lesions of the mucous membranes. It is prone to recur in succeeding pregnancies. Some authors have reported recurrences only when the infant was a boy, which I believe was coincidental. The patient I presented before the Manhattan Dermatologic Society suffered from this eruption in her first and fourth pregnancies, and the infants were of opposite sex.⁹ Several vesiculobullous lesions may be seen, rarely, in the infant.¹⁰ Buschke in 1896 reported a case in which the infant presented pinhead to pea-sized vesicles. Miscarriages, stillbirths, and monstrosities have been reported. My patient gave birth to an anencephalic male infant with spina bifida in the second pregnancy in which the eruption occurred.

Ormsby obtained remarkable results by treating a pregnant woman suffering from this disease with intramuscular injections of 20 cc of another pregnant woman's blood serum at five-day intervals. Maier, Linser, and Heyman reported similar results.

Herpes gestationis is likely to occur earlier and to be of greater severity in succeeding pregnancies.¹¹ Weedman believes that it is due to toxins or ptomaines or is gonadotropic. The variation in the degree of pruritus may be due to a fluctuation in the gonadotropic principle, there being greater quantities in those with mild pruritus and less in those with severe itching. Eosinophilia ranging from 28 to 51 per cent has been reported in the acute phases of the vesicular eruption.

The prognosis in herpes gestationis is good.¹² Dühring said that herpes gestationis resembled dermatitis herpetiformis in every respect except the cause—pregnancy.

Gellhorn reported a death from peritonitis and sepsis in a pregnant woman four days after cesarean section was performed.¹³ Since no vaginal examination had been made at

FIG 5. Proliferative Gingivitis of Pregnancy

any time prior to operation, he thought that the infection was due to the fact that the incision had been made through the diseased skin.

Impetigo herpetiformis is rare in the United States. The eruption consists of pinhead to lentil-sized vesicopustules, which in the beginning are discrete but soon coalesce to form oozing, crusted, foul-smelling lesions, surrounded by a zone of dull erythema. The lesions thus formed spread peripherally by the formation of new pustules, leaving reddened shiny apparently healed areas. In the genitocrural regions large, denuded, crusted, soggy, erythematous lesions are encountered.¹⁴ In the beginning it involves especially the lower part of the trunk and the lower extremities. It finally becomes generalized.

Severe constitutional symptoms accompany this dermatosis. There are fever, rapid pulse, vomiting, diarrhea, arthritic pains, and great prostration. Anorexia, severe pruritus, and insomnia lead to rapid loss of strength and weight. Unlike the other pruriginous dermatoses, lesions of the mucous membranes are present, especially in the mouth cavity. They consist of grayish white plaques bordered by detached necrotic mucous membrane. They are painful and interfere with mastication and deglutition. The dermatosis at this point resembles the later stages of chronic pemphigus vulgaris. Spontaneous abortion has been followed by recovery. Bacteriologic examination of the blood and of the pustules fail to show a causative organism.

The exact cause of impetigo herpetiformis is unknown. It may be due to a toxemia or to an infection. Wolff-Eisner advanced the theory of a foreign protein reaction, anaphylactic in nature, finding its origin in the uterus

crime or neurogenic basis, especially when they disappear after parturition and recur with subsequent pregnancies. These patients are more likely to be of nervous temperament.

A definite dermatologic entity, known as prurigo gestationis of Besnier⁶ occurring in the latter months of pregnancy, is seldom mentioned in the literature. This is probably because it lost its identity when it was included in the group of other pruriginous dermatoses peculiar to pregnancy. This dermatosis occurs in healthy pregnant women, and it consists of discrete pinhead to lentil-sized, severely scratched papules with adherent blood crusts. The lesions occur fairly close together, depending upon the duration and severity of the eruption. It is characteristically confined to the extensor surfaces of the arms, forearms, dorsums of the hands, thighs, legs, and dorsums of the feet. In severe cases the eruption may involve the shoulders, scapular regions, and the chest. Its onset is gradual, and as a rule it persists until the end of pregnancy, when it promptly disappears, leaving small pigmentations at the sites of the former lesions. In a number of cases it recurs with each pregnancy. Unlike the

other pruriginous dermatoses of the child-bearing period, the patient receives considerable relief from antipruritics, such as 10 per cent oil of cade in cold cream. It is my impression that about 2 per cent of the antepartum patients at Misericordia Hospital develop this eruption. There is great constancy in regard to the location, the similarity, and the time of occurrence of this eruption. Vesicles and bullas are never seen clinically in this dermatosis, which differentiates it from the vesiculobullous dermatoses about to be described. In many ways the eruption resembles prurigo mitis of childhood. Twenty cubic centimeters of the blood serum of a healthy pregnant woman administered every day for three days has been of benefit probably because of its estrin content.

Herpes gestationis, an extremely pruritic dermatosis which was first described by Milton⁷ and later by Duhring,⁸ occurs at any time during pregnancy but usually after the fifth month or during the early postpartum period. This eruption consists of grouped vesicles and bullas on an erythematous base. These lesions first appear in the umbilical region, accompanied by burning and itching. The groins, sides of the abdomen, breasts,

pituitary may be responsible for this condition. Changes in the cutaneous appendages have been observed. Chargin reported onycholysis.²¹ Subungual keratosis and other onychodystrophies have been reported in successive pregnancies. Diffuse thinning of the hair of the scalp is seen more frequently than alopecia areata. The linear striae of pregnancy frequently observed must be explained by stretching and increased tension of the skin of the abdomen, buttocks, and thighs, due to increase in the panniculus adiposus. The elastic fibers of the corium are ruptured.

Half the pregnant women develop edema. There is a type peculiar to pregnancy which does not pit on pressure and causes thickening of the features. This differs from the edema following toxemia, cardiac insufficiency, nephritis, or hepatic disease, all of which pit on pressure. The latter type of edema is common in the morning when the patient rises. It frequently affects the feet, hands, and eyelids. It becomes reduced during the day as the circulation improves. It is caused by exudation of serum into the tissues, due to pathologic changes in the blood and capillaries.

The edema that becomes worse during the day is explained on a mechanical basis. It follows pressure of the fetus on the large veins on the extremities preventing normal venous return. Edema accompanied by hypertension is ominous.

Becker and Obermayer reported a patient suffering from erythema of the palms as part of generalized telangiectasia occurring during pregnancy.²² It appeared in the fourth month of her third pregnancy. There were a number of telangiectatic areas from 5 to 10 mm in diameter resembling spider nevi scattered over the face, chest, and arms. Three weeks after delivery the palmar redness faded and the telangiectatic lesions disappeared.

Feldman presented a pregnant woman with a similar eruption affecting the palms and soles.²³ The eruption occurred in three of her four pregnancies, the issues of these pregnancies died of hemorrhages of the newborn. Postmortem investigation revealed hemorrhages in the brain, kidneys, and spleen.

The lesions occurred on the thenar and hypothenar eminences of the palms. These areas were studded with vermilion-colored macules measuring 2 mm in diameter. There was no pain or itching. The eruption did not appear in the pregnancy, which resulted in a healthy infant.

Davis²⁴ states that the occurrence of subcutaneous hemangio-endotheliomas during the latter half of gestation is not an uncommon finding. They may appear for the first time during pregnancy, or there may be a rapid increase in the size of pre-existing lesions. They are most commonly seen on the middle vertical third of the face (usually around the eyes) and occur less frequently on the breasts and umbilical regions. They are single, rarely multiple, vascular, pigmented, warty growths, from pinhead to pea-sized, which are freely movable upon the underlying tissues. There is an associated hyperpigmentation occurring elsewhere, and there is nevoid dilatation of the surrounding veins. These lesions gradually regress after parturition and may be repeated in subsequent pregnancies.

In the great majority of cases, histologic examination is that of a simple nevus, unless malignant changes occur. Davis was able to collect 11 cases from the antepartum clinics in a period of two years. Three of these cases were considered malignant because of their rapid growth and wide infiltration. It is not infrequent for new and previously existing tumors to increase in size during pregnancy.

Condylomas acuminatum (venereal warts) are by no means observed only in pregnant women. Verrucae present at the onset of pregnancy may increase in size and number. They may not appear until the middle months of gestation, at which time they may increase until the masses become plum-sized, obscuring the labia and fourchet. They may cause difficulty at the time of delivery, increasing the danger of infection.

Proliferative gingivitis of pregnancy was described by Wetzel⁵ and by Monash.²⁵ There is a proliferation of the interdental gum tissue, which forms dark red, vegetative-like protuberances. There is evidence of poor dental care. The condition progresses during pregnancy, undergoes involution at its termination, and recurs in subsequent pregnancies. Varying degrees of this condition are observed in 50 per cent of all pregnant women. There is sponginess and bleeding of the gums with occasional loss of teeth. There is no pain, though mastication may be difficult. The possible causes are altered buccal secretions, altered metabolism, toxemia, and lack of calcium or vitamin C.

Improvement has been observed in several cutaneous disorders during pregnancy. Psoriasis is a notable example. Petri²⁶ observed a patient in whom psoriasis cleared up in

FIG 6

FIG 7

FIG 6 Prurigo gestationis.

FIG 7 Mucous patches, moist papules of secondary syphilis

Mayer thought it resulted from a toxemia and that the organism did not react adequately with sufficient antitoxin. Dühring believed that both impetigo herpetiformis of Hebra and herpes gestationis of Authors should be placed under *dermatitis herpetiformis*, both being varieties of the one pathologic process.¹⁵ Because of the occasional manifestation of convulsions, the endocrine theory of causation has its advocates. They believe that the source of the trouble is the parathyroid glands. The maternal mortality is between 70 and 80 per cent. Mayer obtained cures in several cases by the injection of 20 cc. of blood serum of a healthy pregnant woman in an attempt to supply the antitoxin.¹⁶

Like the aforementioned dermatoses, erythema multiforme gestationis may occur at any time during pregnancy or the postpartum period, disappear after delivery, and recur with subsequent pregnancies.¹⁷ The eruption is preceded by intense burning and itching and elevation of temperature. The early lesions are pale erythematous patches, which soon show urticaria-like changes. They become bright red, varying in size and shape and coalescing in some places. There is a predilection for the extensor surfaces of the extremities. Lesions of the mucous membranes may be present. Ashton L. Welsh,¹⁸ in discussing a case of Madden's before the Minnesota Dermatologic Society, stated that in these cases he had been able to isolate a streptococcus from the nasopharynx of the type he had previously isolated from non-pregnant patients suffering with erythema multiforme. It is differentiated from gestational pemphigus, which it resembles in the early stages, by the fact that salt retention was demonstrable in the latter condition but not in erythema multiforme.¹ It may be

caused by a toxemia of pregnancy as reported by Kaiser.

Brickner described a disease that is seldom included in the dermatoses of pregnancy, he named it *fibroma molluscum gravidarum*.¹⁹ It might better have been called *papilloma coli*, because the lesions are seen most frequently on the sides and front of the neck. It also occurs on the breasts and inframammary regions. The lesions appear in the latter half of pregnancy, gradually increase in size, and undergo involution after delivery. From a clinical, histologic, and endocrinologic point of view they are analogous to the cutaneous tags described by Templeton²⁰ (which occur during the menopause). They are pin-head to half-pea-sized, flesh-colored, or pigmented excrescences. One of the gonadotropic hormones is an ectodermal stimulant. In pregnancy and the menopause, in which these cutaneous tags occur, certain hormones exist in the urine which are common to the two conditions. Aschheim recently stated that certain identical ovarian follicular reactions take place in experimental animals after the injection of the urine of pregnant women and women who have reached the menopause. They are soft fibromas. There is no clinical evidence that they are warts. There is no thickening or hypertrophy of the horny layer on histologic examination.

Hyperpigmentation is seen during pregnancy and is progressive, occurring in typical locations. The cause of these deposits of melanin is unknown. It has been ascribed to slow circulation in the capillaries, hypertrophy of the adrenal glands, increase in the melanophore cells and stimulation by hormones from the hypophysis cerebri, lack of vitamin F, and abnormal iron metabolism.⁴ Zondek thinks that the adrenals or mid-

Prurigo gestationis (Besnier) occurring in the last trimester has been admirably described by our essayist, and, despite the fact that he states its incidence is about 2 per cent at Misericordia Hospital, I personally do not recall ever observing this entity until the above-named caption.

From a historical point of view it was quite interesting to read a book published by Max Joseph in 1895 in reference to impetigo herpetiformis. It was first described by Ferdinand Hebra of the Viennese School in 1872 with due emphasis that the primary lesion was a pustule. A few years later Kaposi from the same school made additional observations. Occasionally, the lesions become papillomatous and so suggestive of pemphigus vegetans. Dr Costello describes the condition quite clearly but thinks that the primary lesions are either vesicles or bullae. I am inclined to believe that they are always pustules and appear in crops. It is noteworthy that cases of impetigo herpetiformis were reported by du Mesnil and Marc in nonpregnant women. Likewise, Kaposi and Patsky reported cases in the man. Neumann named the disease, owing to the presence of primary pustules, herpes pyaemicus and states that clinical examination revealed peritonitis, as well as perianal and parametritis.

It is natural to infer, as Dr Costello states, that the etiologic factor is either an infection or a virulent toxemia. From a clinical standpoint we have three different dermatoses—namely, prurigo gestationis (Besnier), herpes gestationis, and impetigo herpetiformis—presenting, as primary lesions, a papule, vesicle or bulla, and a pustule, respectively.

Possibly the most distressing eruption of this particular group is a generalized urticaria, and, not unlike a similar condition in the nonpregnant, this eruption is quite resistant to therapy. The intravenous injection of 10 cc of a 10 per cent solution of strontium bromide may afford some relief. Personally I have not used torantal, fearing nausea and possibly emesis.

In conclusion, manifestations arising from the invasion of the Trichomonas vaginalis, the pruritus vulvae et ani induced by the Monilia albicans or other yeast organisms, and tinea cruris induced by the epidermophyton inguinale do not belong, I believe, to this category. All were probably existent prior to gestation, and I admit that with the advent of additional vaginal discharge and edema of the genitalia a better medium was obtained, and so a better growth ensued. Finally, I believe Dr Costello is to be congratulated upon this unique presentation. He has utilized in its compilation quite an extensive bibliography and at the same time has contributed much of his own personal efforts.

Dr Henry D Niles, *New York City*—One feature that especially interested me in Dr

Costello's excellent and instructive paper was his discussion of the soft fibromas that are seen on the neck of pregnant women. I was not well acquainted with this condition until a few years ago when a patient who was about four months' pregnant consulted me about these lesions on her neck. She said that her obstetrician had told her that they were common in pregnancy.

I do not believe that the average dermatologist is aware of the frequency of these lesions during pregnancy and at the menopause. I have treated three or four patients with this condition by dailyunctions of a cream containing estrogenic hormone. This treatment was suggested to me by an internist and, so far, my results have been satisfactory.

I was also especially interested in Dr Costello's paper because of a patient whom I have been treating in the last few weeks. When I first saw her she was in her sixth month of pregnancy and presented a widespread eruption of erythema multiforme with typical bullous and iris lesions. Later the appearance of the eruption changed completely and resembled a dermatitis venenata with many small papules and vesicles over the entire body except the face. Her discomfort and itching became so intense that she was hospitalized, and the pregnancy was terminated at about eight and one-half months. Immediately after evacuation of the uterus, the eruption greatly improved and the itching became much less severe, but a few days after this she developed new pemphigus-like lesions, consisting of large bullae arising from the normal skin on the flexor surfaces of her upper arms, neck, and lips. She had 57 per cent eosinophiles, which is higher than any of the figures which Dr Costello mentioned. The multiformity of lesions and the variation in the clinical picture at different times in this case are characteristic of eruptions occurring during, and immediately after, pregnancy.

Dr Timothy J Riordan, *New York City*—Out of the many skin conditions observed in pregnancy, three are particularly associated with this condition. Of these, the outstanding one is herpes gestationis. This vesicobullous condition presents a real problem to the dermatologist, the obstetrician, and the patient because of the severe itching. I believe it aids the patient's mental reaction by reassuring her that the symptoms and the condition will subside when the pregnancy is terminated. It can also be stated that occasionally one severe attack may follow soon after delivery. I have collected about 8 cases in my experience, and it is worth noting that in these the itching was relieved best by the use of sulfur combined with balsam of Peru about 5 to 10 per cent buffered with prepared chalk and soft soap. This is also the formula that is used in the treatment of scabies.

each of her five pregnancies Spitzer²⁶ made a similar observation, the patient having a recurrence between each of her nine pregnancies. Levy and Franke have observed cases where psoriasis occurred for the first time during pregnancy. Eczema may appear only during gestation, or a previously existing eczema may be aggravated at that time.²⁷ I have observed eczema of the nipples and areolas of the breasts in the antepartum period and during lactation. The condition is frequently aggravated by nursing, at times requiring the removal of the infant from the breast. Acne may improve or appear for the first time during gestation. Cutaneous tuberculosis is often aggravated during gestation, and there is a dearth of syphilitic eruptions during the childbearing period. Pregnancy has a salutary effect on maternal syphilis, often suppressing or ameliorating its cutaneous manifestations.²⁸

The eruptions of pregnancy just described are capricious in regard to time, duration, recurrence, and severity. They are multiform in character, polymorphous in type, acute in onset, and in many instances decidedly inflammatory, as evidenced by erythema, vesiculation, and bullous formation. There are all gradations of the eruptions of pregnancy, from generalized pruritus to the acute fulminating vesiculopustular dermatosis, impetigo herpetiformis, which usually terminates in death.

Discussion

Dr Mark Heiman, *Syracuse, New York*—The primary effort of Dr Costello in presenting this paper is to group the eruptions of pregnancy (although they represent nearly twenty dermatoses) into a separate classification. Whether we should consider them all as being truly pathologic or due merely to overburdened physiology is problematic. Their recession or disappearance at delivery or a short period following the same bespeaks of either hypo- or hyperendocrinal activity and either pituitary, adrenal, ovarian, or thyroid and still must be considered physiologic.

We, as dermatologists, with few exceptions have no difficulty in diagnosing these dermatoses clinically. However, our efforts to relieve these women from their symptomatology is not so readily attained.

Naturally, one cannot discuss this paper in detail, and because our essayist has so credibly described these dermatoses I have no additional comment to offer. However, I desire to add to the group, lichen planus. I have observed it several times during the latter months of pregnancy, but more often several months after delivery, usually in a primipara. As its etiology is still uncertain, possibly we might add it to the neurogenic classification.

For the sake of argument I wish to supplement this particular group with an additional entity—namely, pityriasis rosea. I have observed it several times during pregnancy, and it usually appears during the second trimester of gestation. While I cannot definitely substantiate its appearance or state with exactness its role in relationship to this particular group, still I desire to make it.

I have seen psoriasis aggravated during pregnancy, and then again I have observed its retrogression, finally appearing after delivery, and then a subsidence with following pregnancies.

I believe herpes gestationis to be dermatitis herpetiformis (Duhring) and have observed it only recently during a fourth pregnancy with a definite history of its presence during the three prior gestations—no dermal lesions in the interim, except possibly grouped pigmented areas, which gradually disappeared.

HEREDITARY LYMPHEDEMA (MILROY-METGE)
ASSOCIATED WITH PTOSIS OF THE EYELID

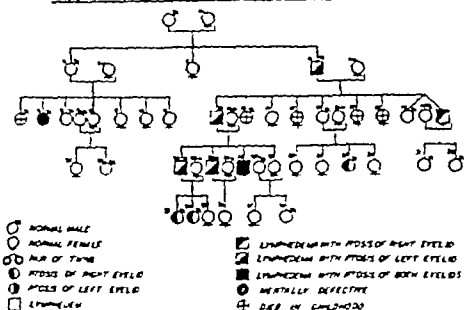

FIG 1 Family Tree

eight years following the development of the edema the patient had recurrent attacks of inflammation of both legs which started with pain in the groin and were associated with high fever and chills, confining him for several days to bed. These acute attacks, which were diagnosed by his physician as erysipelas, occurred twice or three times a year and had ceased entirely fifteen years ago.

Further questioning revealed that other members of his family were affected with a much more considerable edema of one or both extremities and that all of them also had ptosis of one or both upper eyelids. The affected members were his younger brother (No 24), one of his sisters (No 25), his father (No 12), one of his paternal aunts (No 20), and his paternal grandfather (No 4).

The patient is married and has 3 children—2 boys, aged 10 and 7 years, and a girl, aged 19 months. Both boys show ptosis of the right upper eyelid but no swelling of the extremities (Nos 33 and 34), while the girl has not yet shown any abnormality.

Examination. Heart and lungs were normal. The blood pressure was 120 diastolic by 80 systolic. Examination of the urine gave negative results. The Wassermann reaction of the blood had been found negative two years and one year previously. The basal metabolic rate was -6 per cent. Examination of the blood on January 23, 1940, showed 97 per cent hemoglobin, 5,200,000 red cells, 9,500 white cells, and 240,000 platelets. The color index was 0.96 per cent. The differential count showed 2 per cent eosinophiles, 9 per cent stab, 44 per cent segment, 20.5 per cent small lymphocytes, 1.5 per cent large lymphocytes, 4.5 per cent monocytes, and 18.5 per cent young lymphocytes. Because of the high count of young lymphocytes and leukocytes, the blood count was repeated on February 29, 1940, which showed a still higher leukocyte count of 14,300 but only 9.5 per cent young lymphocytes. This marked leukocytosis and the differential count indicated an infectious reaction.

FIG 2 CASE 1 Ptosis of the left eyelid

FIG 3 CASE 1 Edema of the ankles

Careful examination revealed normal fundi, normal corneal reflexes, and prompt reaction of both pupils to light and accommodation. The left pupil was slightly irregular and the left upper eyelid was ptosed, covering almost one-half of the cornea. There was a slight facial weakness on the left side, especially on smiling. All other cranial nerves were normal.

The motor power of the upper and lower extremities was well preserved. The tendon reflexes were present and equal. There were no pyramidal or cerebellar symptoms. The abdominal reflexes were equal and only the cremasteric reflexes could not be produced. There were no sensory disturbances of any kind. The gait was normal. Thus, except for the irregularity of the left pupil and ptosis of the left upper eyelid, the neurologic findings were practically normal.

An intracutaneous trichophytin test was per-

HEREDITARY LYMPHEDEMA (NONNE-MILROY-MEIGE)

Report of a Family with Hereditary Lymphedema Associated with Ptosis of the Eyelid in Several Generations

DAVID BLOOM, M D , New York City

THE purpose of this paper is to report a family in which members of several generations were affected with chronic lymphedema of the lower extremities in association with ptosis of one or both upper eyelids. I discovered the lymphedema accidentally in the original patient when he consulted me for recurrent furunculosis. His rather remarkable cooperation made it possible for me to examine personally all the affected and several of the nonaffected members of the family.

Although this type of lymphedema offers many points of scientific interest worthy of discussion, I will limit this report to a description of the family and to a discussion of some points that are of importance in regard to the pathogenesis of this abnormality.

Terminology

If there is any justification for attaching names of investigators to disease terms the name of Nonne should be added to that of Milroy and Meige, for Nonne¹ was the first to report a family with this type of edema in 1891, while Milroy² published his report in 1892, and Meige³ in 1899. Nonne used the term "congenital hereditary elephantiasis," and since then this term has been frequently employed in the German literature. Since Milroy, an Omaha physician, has published his report in the *NEW YORK STATE JOURNAL OF MEDICINE*, hereditary edema has been known as "Milroy's disease." In France the term "trophoedème de Meige" is being used, for this author introduced the term trophoedema because he assumed that changes in trophic centers of the spinal cord were the cause. However, this nervous theory is not yet definitely proved, although its correctness seems to be indicated by some facts. I, therefore, prefer not to use the term trophoedema, which anticipates definitely the pathologic nature of the process. The term elephantiasis is not correct, since the fibrosis which is present in many cases is secondary due to accumulation of lymph fluid, which is known to stimulate fibroblastic growth. In

other cases, probably, the fibrosis is also the result of recurrent attacks of inflammation due to infection with the streptococcus.

Although in all the 8 affected members of the family described by Nonne and in 20 out of 22 members of the family reported by Milroy the edema appeared at, or soon after, birth, in the cases of Meige and in most of the reports published later the abnormality was noticed in childhood and in later life, but mostly in the second decade. The term "congenital" is, therefore, to be discarded in the designation of the anomaly.

Report of a Family (See Family Tree, Fig 1)

*Case 1 (No 25) **—A C, a white man, aged 39, born of Russian-Jewish parents, came to see me in September, 1939, complaining of recurrent furunculosis. He seemed otherwise to be in good general health. He was an electrician by occupation and attended to his work without any difficulty.

On examination, two abnormal features were noted—namely, ptosis of the left upper eyelid which covered almost the upper half of the cornea (Fig 2) and a considerable padlike thickening of the ankles of both feet (Fig 3). This swelling felt soft and left slight pitting on pressure. The legs up to the knee were only slightly edematous. The feet and toes looked thickened, and the dorsum of the toes, particularly of the large and second toes, showed verrucose formation. There was maceration of the webs of the toes, which were close together because of their increased thickness. Both legs and feet showed moderately large varicose veins. Over the sacral region there was a tuft of hair.

Questioning elicited the fact that the ptosis had been present since infancy and that the swelling of his ankles and legs had started at the age of 16. Within a few years following its appearance, the edema gradually increased to a certain size, this has persisted since then without any further change in extent or intensity. While the edema of the legs used to disappear following rest in bed, the edema of the ankles receded only slightly. The patient had been wearing elastic bandages which helped him to go about his work without any discomfort and kept the swelling of his legs from becoming larger. For about

left upper eyelid showed ptosis but to a lesser degree than that of Case 1

Six years ago, following an acute inflammatory attack of his legs, he was confined for about two weeks at Mount Sinai Hospital. At that time the usual laboratory examinations had been performed. A blood Wassermann test gave a negative reaction, and a complete blood count was normal. Urine examination and a kidney function test suggested moderate renal insufficiency. A roentgenogram of the legs did not reveal any abnormality of the bones. A Kondeleone operation was considered at that time but was not carried out because of the recent flare-up of the lymphangitis. Attention was then called to the condition of his toes which suggested dermatophytosis and which the attending surgeon thought may give rise to repeated inflammatory attacks.

Because of the spina bifida occulta found in his brother, a roentgenogram of his lower spine was taken. This, however, did not reveal any abnormality of the vertebral column.

The patient is married and has an infant, a few months old, whom I examined and found normal. The father, however, stated that on several occasions he had noticed ptosis of the left eyelid.

Case 3 (No 25)—M W, aged 31, a sister of the above 2 men, showed moderate edema of both legs and ankles and ptosis of both upper eyelids. Her history revealed that the swelling started on the left ankle at the age of 13 and gradually extended to the present size. She has never had any febrile inflammatory attacks of her legs. Rest in bed made her edema disappear entirely, but several hours after being on her feet the edema reappeared. She stated that ptosis of both eyelids was present at birth and was so marked that at the age of 6 months she had to undergo an operation at Mount Sinai Hospital. The patient is married but has avoided having children in order to spare them the mental suffering she had undergone during childhood because of her ptosis, she had been constantly teased by her playmates because of her Mongolian appearance due to the narrow lid opening.

Case 4 (No 12)—L. C., the father, aged 58, showed the same degree of involvement of both lower extremities as Case 2 and also had ptosis of the left eyelid. At the age of about 15 he had developed inflammation of the left leg, associated with high fever, which was followed by enlargement of the leg. Half a year later the right leg became inflamed and was followed by enlargement of this leg also. These acute attacks recurred first every four to five weeks, then at greater intervals up to the age of 20, at which time they ceased to appear. The enlargement of the extremities developed gradually, and it took a few years until it reached a size that has remained unchanged until the present time. Rest in bed diminished the swelling considerably. He is forced to wear elastic bandages, otherwise the swelling would become enormous.

Case 5 (No 20)—B A, a sister of Case 4, is the twin sister of a normal brother (No 19), aged 39. She was examined by me at the Kings County Hospital where she was confined to bed with an advanced carcinoma of the rectum. Because of her condition, no detailed history could be obtained. It is almost certain, however, that her lymphedema had been present since her early teens. Examination revealed that the left lower extremity was markedly thicker than the right and that there was a pad-like swelling over the left ankle. The right lid opening appeared smaller than the left. Her 2 sons, aged 6 and 4, are said to be free of any abnormality. The patient died one month later at her home. Permission for an autopsy was denied.

Case 6 (No 4)—W C, aged 80, the grandfather of our original case, showed ptosis of the left upper eyelid and enlargement of the left leg up to the knee that was cylinder-like in shape. The dorsum of the toes showed verrucose formation. The right leg, which was much thinner, had marked varicosities. This man was intelligent enough to be trustworthy concerning his statement that his ancestors, as far as they were known to him, had normal eyes and extremities and that he was the first in three generations to exhibit the abnormalities. The edema of his leg had developed at the age of 13 following an attack of inflammation. This attack was associated with inguinal adenopathy and pain in the left groin and confined him to bed for seven weeks. The second attack resembling the first one took place ten years later. He had had five attacks altogether. Because a rather marked ptosis of the left upper eyelid became increasingly worse, he had to be operated upon a few years ago at the Brooklyn Eye and Ear Hospital. For the past thirty years he has worn elastic bandages which make it easier for him to walk around.

Case 7 (No 29)—M C, aged 18, first cousin of the original case, shows moderate ptosis of the right upper eyelid as the only abnormality.

Of the other members of the family No 5 was subject to epileptiform attacks and died at the age of 3, No 6 was mentally defective and died at the age of 24 of unknown cause, No 12 died one day after birth, No 15 and No 17 died at the age of eight months of unknown cause, and No 18 was stillborn.

Nine other members of the family, Nos 30 to 38, range in age from a few months to 14 years and, therefore, are still below the age of manifestation as far as the lymphedema is concerned. Two of them, Nos 33 and 34, sons of our original case, show ptosis of the right eyelid.

Summary of the Clinical Findings

Of the family members affected with lymphedema, there were 4 men and 2 women. In 1, the edema involved the left leg, in an-

FIG 4.

FIG 5

FIGS 4 and 5 CASE 2 Enlargement of the feet, legs, and thighs

formed on the leg and arm. The area of injection on the leg became pruritic four hours after the test. After twenty-four and forty-eight hours both areas showed equal strongly positive reactions.

A roentgenogram of the spinal column revealed spina bifida occulta in the region of the first sacral vertebra.

Course While under my care for furunculosis, he developed on the dorsum and inner side of both large toes, more over the left, an ulceration that resisted any treatment. The patient informed me that this ulceration had recurred twice a year for the past ten years and had cleared up only following several days, complete rest in bed. The correctness of this statement was, indeed, confirmed by healing of the lesion after the patient was confined to bed for several days.

Case 2 (No 24) *—O C, aged 28, the brother of Case 1, was also in good general health and attended, without any difficulty, his occupation as electrician. From him I obtained the following history. At the age of 12 he developed inflammation of the right leg which was associated with chills and high fever and was followed

by persistent swelling of this leg. A few years later the swelling of the left leg developed in the same way. Since then, both legs and thighs have been considerably enlarged. By rest in bed they diminished only slightly in size. These attacks of inflammation of both lower extremities, which lasted from two to twelve hours, have been recurring once or twice a year. Like his brother he applied bandages to his legs. This enabled him to go about his work without discomfort. Without the bandages the legs become much more swollen and cause discomfort.

Examination of the patient showed a much more marked involvement of both lower extremities in extent and intensity than that of his brother (Figs 4 and 5). Both ankles were considerably thickened, felt fairly soft on pressure, and did not leave any pitting. There was a deep crease anteriorly and posteriorly, separating the leg from the foot. Both legs and thighs up to the upper third were considerably enlarged and cylindrical in shape. Their consistency was firm. On the right leg and on the left ankle there were scars, the results of incisions of abscesses that had developed during attacks of lymphangitis. The feet and toes were also thickened, and some of the toes showed, on the dorsal aspect, verrucose formation. The

defective person and 1 epileptic member among a family of such size

Discussion of the Genetic Mechanism

The type of persistent edema of the extremities as observed in all the affected individuals of the family described is to be included in the group of primary noninflammatory edemas, the so-called "hereditary lymphedema," which is associated mostly with the names of Milroy and Meige. The particular significance of this family is the association of lymphedema with ptosis of the eyelid in several members of four generations. In studying the literature I found two reports that suggest, possibly, a similar combination. In 1 of the 8 affected members of the family reported by McGuire and Zeek³ there was noticed a slight oculomotor weakness on one side with concentric limitation of the visual fields. In an isolated case of hemihypertrophy of the body reported by André,¹³ which possibly belongs in our group of cases, one eye had a smaller lid opening than the other. Except for these two reports, I have not found such an association in the literature.

When we start the count from the generation in which the lymphedema became manifest and omit any member below the age of 16, which is the end of the manifestation period for this anomaly in this family, we have 23 blood relatives included in the survey count. Of these, 6 are affected with lymphedema and 17 are free. Of course the ratio between the trait-carriers and the normal is not yet final, for 14 descendants have not reached the manifestation period—5 because of death in infancy and early childhood and 9 because of being below the age of 16.

The lymphedema occurred in three consecutive generations and the ptosis in four. One of those affected with ptosis (No. 29) has only a grandparent with the same condition, while his father (No. 16) is phenotypically free of the anomaly. In this family the lymphedema and the ptosis both follow the dominant mode of mendelian inheritance. This corresponds to the family reports in the literature on lymphedema (Bullock,¹⁴ Cockayne¹⁵) and on ptosis (Passow¹⁶).

Conclusion

This family, which shows the unique association of lymphedema of the lower extremities with ptosis of the eyelid, permits no other conclusion concerning the pathogenetic mechanism involved except that both

conditions follow the same mode of mendelian inheritance. In view of the absence of a report in the literature on such an association in about 20 families with lymphedema with more than 100 affected members, and, on the other hand, in view of the fact that in the many cases of ptosis reported in the literature the presence of lymphedema is not mentioned, this association in our family must be considered coincidental.

With regard to the hereditary mechanism of lymphedema itself, it must be assumed, from the analysis of our family which corresponds in the essential features with about twenty other families recorded in the literature, that lymphedema is hereditary and follows the mode of single dominance. The expressivity of the anomaly may be regular or irregular.

However, there is no satisfactory information available as yet about the different types of noninflammatory edema reported in the literature, all of which seem to belong in one group in which the cases described in this report also belong. These cases differ in many ways. Some show the anomaly at birth—others, later in life. Some seem to follow an injury, others appear spontaneously. Some show the edema not in the usual location—namely, on the lower extremities—but on the upper extremities or on the face. Last but not least, there are numerous isolated cases without any accumulation of the anomaly in the family. What is the relationship between all these different varieties of lymphedema? Have they a common, uniform, pathogenic mechanism?

With regard to the isolated cases one may be inclined to consider them as a separate nonhereditary group. However, this classification may be wrong, for first, we do not know whether or not the families of the isolated cases have been adequately investigated, second, isolated cases do not exclude heredity, for the trait may be latent in several generations (this would mean, genetically, that the expressivity of this particular trait is limited and perhaps dependent on the presence or absence of other genetic factors), last, it must be considered that a new genetic condition may arise by mutation.

A definite clarification of this genetic problem is possible only with an accurate family investigation of a large unselected group of such cases or by the study of an unselected series of twins. The methods of such investigation have recently been demonstrated by Kallmann¹⁷ in psychiatry.

other, the whole left lower extremity, in 2, both lower extremities, and in 2 others, both ankles. In 2, the lymphedema had become elephantastic. One showed marked varicosities on the leg that was free of lymphedema, and another had moderately large varicosities of both legs and feet. The age at which the abnormality manifested itself varied between 12 and 16. A history of acute lymphangitis attacks was obtained in 4, while 1 had no such attacks. In the sixth case no detailed history could be obtained. Three members stated that the attacks developed first and the swelling of the legs followed, while 1 stated that the edema appeared first and the attacks later. Of the 6 individuals affected with lymphedema, 3 had ptosis of the left upper eyelid, 1, of both upper eyelids, and 1, of the right upper eyelid. Of the 3 other cases that were free of lymphedema but had ptosis of the right upper eyelid, 1 boy was 18 years old and the 2 other boys were 10 and 7, respectively. In all cases the ptosis was noticed at, or soon after, birth. In 2 the ptosis was so pronounced that operation had to be performed.

General neurologic and laboratory examinations of the original patient revealed, besides the lymphedema, ptosis, and leukocytosis, nothing essentially abnormal. Examination for spina bifida occulta was possible in this case and in his brother, and it was found only in the original patient. One of the affected members died of cancer of the rectum. One nonaffected member was a mental defective, and 1 child who died at the age of three was subject to epileptiform attacks.

Discussion of Some of the Clinical Findings

Of the different clinical features, the recurrent inflammatory attacks of the affected extremities are of interest. There is frequent mention in the literature of these erysipelas-like attacks in the course of hereditary lymphedema. Hope and French⁴ report a family of five generations, 13 members of which had lymphedema, and most of them were subject to recurrent attacks of lymphangitis. These attacks have been so frequently reported that there are some authors who consider these as the cause of the edema. This conception, however, is not borne out by the facts, for in many cases, as in the members of the family reported by Milroy and in the family reported by Rolleston,⁵ the attacks were absent, and in many others they start long after the swelling has been present. Of

the 15 affected members of the family reported by Brandt,⁶ only 5 had recurrent acute attacks. In these, the swelling developed first and the attacks followed later. In my report 3 family members stated that the attacks appeared first followed by persistent swelling, and one stated that the attacks followed later.

One member denied having had any attacks at all. The cause of these attacks may be assumed to be due to infection with the streptococcus. For the accumulated lymph fluid in the tissues offers the streptococcus a good medium for growth. The point of entrance of these organisms are the toes, which, being thickened, lie close together and favor dermatophytosis and injury to the skin. I have not been able to investigate whether these recurrent attacks are due to the streptococcus or, as Sulzberger⁷ suggests, to the fungus itself, for I had no occasion to observe my cases during the attacks. However, the finding of the hemolytic streptococcus in the tissue removed by McGuire and Zeek⁸ during an attack and the fact that most of the cases of erysipelas-like attacks secondary to epidermophytosis observed by Lowenberg⁹ responded almost specifically to streptococcus antisera speak in favor of the contention that the recurrent attacks are produced by the streptococcus.

The frequent association of spina bifida occulta with so-called hereditary lymphedema has been considered by some as a point in favor of the nervous theory in regard to the pathologic nature of lymphedema. Jaroschy,¹⁰ Lévi,¹¹ and others consider this association as not coincidental. However, in view of the great frequency of spina bifida occulta in normal people, no deduction whatsoever can be made from the presence of this anomaly in one of the affected members of the family. The fact that the brother of this patient had no anomaly of the spinal column, although he had much more pronounced lymphedema, favors this attitude.

The presence of a mentally defective member in the family who died at the age of 24 and of a child with epileptiform attacks who died at the age of 3 is to be mentioned as a matter of record, but no conclusion is to be drawn in spite of the significance that has been frequently attributed to the presence of epilepsy and mental disorders in such families (Hope and French⁴ and Weber¹²). The percentage of mentally defective and epileptic individuals in the general population is considerable enough to disregard the presence of 1 mentally

conception As to the cause of ptosis of the eyelid, there may be involvement of the oculomotor nerve, the levator palpebrae muscle, or the nucleus of the oculomotorius nerve But I have not read of any involvement of the lymphatics

producing ptosis I am afraid the discussor has put up an improbable hypothesis which fits in with his belief that the pathologic lesion of hereditary lymphedema consists in an abnormal weakness of the lymphatics

PRESCRIPTION FOR A HEALTH INSURANCE PLAN

The Medical Society of the County of New York, at its meeting on January 27, adopted a resolution defining what a health insurance plan should and should not be, offered by a special committee The resolution ran, as reported in the *New York Medical Week*.

"Resolved, That neither this Society nor any of its officers, as such, shall, by resolution or action, encourage or publicly approve any experiment or plan connected with the provision of medical service, if such experiment or plan is inconsistent with the following principles, viz

"1 Participation by the physician shall not impose or promote violation of the Code of Ethics of the American Medical Association by him

"2 Participation of the physician shall not impose or promote conduct on the part of such physician in violation of the Rules of Professional Conduct of the Medical Society of the State of New York.

"3 The experiment or plan shall operate under the provisions of Article IX-C of the Insurance Law and be subject to the supervision of the Superintendent of Insurance

"4. No experiment or plan shall be approved which by precedent might lead to the creation of commercialized competition, including solicitation of patronage with the inducements of price-cutting, or the lowering of standards of medical practice—all conditions which must lead to demoralization and ultimately to governmental control of the medical profession.

"5 No experiment or plan shall be approved which does not afford equality of opportunity and reward to all physicians in good professional standing living or practicing in the territory or community of such experiment or plan.

"Your Committee has been constantly mindful of the fact that we represent the entire membership of the Medical Society of the County of New York and, properly, have had every member's interest at heart We are, therefore, unwilling to recommend any plan which will permit any person, group or combination of groups of physicians to function in the care of patients to their own advantage and to the disadvantage of other members of this Society

"It is the opinion of this Committee that a Medical Expense Indemnity plan should be approved at this time On the other hand, it is suggested that the Medical Society of the County of New York would not object or wish to interfere with a reasonable proposal for a complete health service and medical care coverage if it adheres to the following general principles

"A. Proof of integrity of management.

"B Adequate recompense to the physician in proportion to the social and economic status of the participants involved.

"C Ability of the plan to implement a rational health conservation and preventive medicine program.

"Motion to table this report was lost.

"Motion to accept this report and adopt its resolution was passed "

"THE FOUNDATION PRIZE"—AMERICAN ASSOCIATION OF OBSTETRICIANS, GYNECOLOGISTS AND ABDOMINAL SURGEONS

(1) The award which shall be known as "The Foundation Prize" shall consist of \$150

(2) Eligible contestants shall include only (a) interns, residents, or graduate students in Obstetrics, Gynecology, or Abdominal Surgery, and (b) physicians (with an M D degree) who are actively practicing or teaching Obstetrics, Gynecology, or Abdominal surgery

(3) Manuscripts must be presented under a nom de plume, which shall in no way indicate the author's identity, to the Secretary of the Association together with a sealed envelope bearing the nom de plume and containing a card showing the name and address of the contestant

(4) Manuscripts must be limited to 5,000 words, and must be typewritten in double-spacing on one side of the sheet. Ample margins should be provided. Illustrations should be limited to such as are required for a clear exposition of the thesis

(5) The successful thesis shall become the property of the Association, but this provision shall in no way interfere with publication of the

communication in the journal of the Author's choice. Unsuccessful contributions will be returned promptly to their authors

(6) Three copies of all manuscripts and illustrations entered in a given year must be in the hands of the Secretary before June 1

(7) The award will be made at the Annual Meetings of the Association, at which time the successful contestant must appear in person to present his contribution as a part of the regular scientific program, in conformity with the rules of the Association The successful contestant must meet all expenses incident to this presentation

(8) The President of the Association shall annually appoint a Committee on Award, which, under its own regulations, shall determine the successful contestant and shall inform the Secretary of his name and address at least two weeks before the annual meeting

—JAS R. BLOSS, M D, Secretary
418 Eleventh Street,
Huntington, West Virginia

But genetic studies do not invalidate the necessity of a thorough investigation of the individual cases. As to hereditary lymphedema, there is insufficient knowledge in regard to the anatomicopathologic condition of the nervous system. Therefore, in order to clarify the actual pathogenetic mechanism of the group of lymphedema, which is called hereditary, careful pathologic studies of the nervous system are necessary in addition to detailed and accurate genetic investigation.

Summary

1 A family of 37 members in four generations was reported in detail, 6 of which were affected with hereditary lymphedema in association with ptosis of one or both eyelids, and 3 with ptosis only.

2 The occurrence of inflammatory attacks, the association with spina bifida occulta, and the presence of mental deficiency and epilepsy in such families were discussed.

3 The genetic mechanism was discussed.

4 The association of lymphedema with ptosis does not permit any conclusion with regard to the pathogenetic mechanism involved.

5 Attention was called to the different types of cases of primary noninflammatory lymphedema which require elucidation with regard to their relation to each other and to a possibly uniform pathogenetic mechanism.

6 In addition to detailed and accurate genetic investigation, careful pathologic studies of the nervous system are necessary.

Discussion

Dr William Director, New York City—This is an interesting group of cases since the association of hereditary lymphedema and ptosis of the eyelids has not yet, to my knowledge, been reported. This disease is classified by Cockayne as congenital and of late onset. The first group is not preceded by inflammatory attacks, while, in the latter, onset occurs up to about 18 or 20 years and the swelling is often noted only after one or more attacks of lymphangitis. Dr Bloom's cases obviously belong in the late or inflammatory group, although 1 case had swelling without previous lymphangitis. In all the cases the ptosis occurred much earlier than the lymphedema of the legs.

Concerning the pathogenesis, it seems reasonable to assume that the basic fault is maldevelopment of the lymphatic tissue and that the difference between the congenital and late types is merely quantitative. In the congenital cases the swelling occurs early because there is marked disturbance of the lymphatic circulation of the lower extremities, while in the late cases the threshold is higher and swelling occurs only after infection and the ensuing lymphangitis, which break down the competence of the lymphatic vessels. Furthermore, the ptosis of the lids also may possibly be due to maldevelopment of the lymphatics of the upper lid. It is not quite clear from Dr Bloom's report whether the ptosis is due to real nerve (oculomotor) impairment or may only be apparent from swelling of the lid.

Genetically, I think it proper to count only the families deriving from the affected grandfather (No 4 of Fig 1). One should omit the 4 sibs who died in infancy and of whom little was known and the 2 children with ptosis (Nos 33 and 34) but not, as yet, lymphedema, and No 29 should be reckoned abnormal. There was also 1 normal male conductor (No 16). By this count there are 9 abnormal members, 1 normal conductor, and 12 normal members in the four generations well accounted for, thus giving a ratio of 10 abnormal to 12 normal. This is quite close to the expected 1:1 ratio for a simple dominant hereditary characteristic.

Dr David Bloom (Concluding Remarks)—If I would have read the paper in full, many of the remarks made by Dr Director would have been superfluous. Although there are some authors who explain the pathogenetic mechanism by the weakness of the lymphatics, there are many more who bring forth many reasons against this theory and favor the theory that the vasomotor nervous mechanism is disturbed. Many observations speak for the correctness of this latter

FIG 1 Estrane

FIG 2 Estrone

FIG 4 Progesterone

is so named because its biologic actions in rodents are similar to that of the gonadotropic hormones of the pituitary gland, though not exactly the same

Estrogens

We will first consider the estrogenic commercial preparations. Four units are commonly used for their standardization: the international unit, the international benzoate unit, the rat unit, and the mouse unit. The most frequently used are the international unit, or I U, and the international benzoate unit, or I B U. These are defined, respectively, as 0.1 microgram of a standard estrogenic substance, known as crystalline keto-hydroxy-estratriene or estrone, and as 0.1 microgram of a standard estrogenic substance, known as crystalline estradiol benzoate.

The essential nucleus of all the estrogens is estrane, and its formula is $C_{15}H_{20}$ (see Fig 1). The formula of keto-hydroxy-estratriene is shown in Fig 2. The formula of estradiol benzoate is shown in Fig 3.

From the above definitions we can readily see that the international unit and the international benzoate unit is applicable only to those estrogens whose formulas are, respectively, keto-hydroxy-estratriene and estradiol benzoate. For the standardization of the other products, the rat and mouse units are employed, which are commonly abbreviated as R.U. and M.U.

The rat unit is the minimum quantity of estrogenic substance necessary to produce vaginal signs of estrus within seventy-two hours in a castrated adult female rat when administered in three doses at four-hour intervals. The mouse unit utilizes castrated adult female mice and is the minimum quantity necessary to produce vaginal signs of estrus when administered in six doses within forty-eight hours.

To find a common ground for these four units, it should be remembered that the rat unit and the international benzoate unit are approximately equal. These units are equivalent to 5 international units. The potency of the mouse unit is somewhat more

disputed, but it is accepted as being equal to 1 international unit. With this knowledge we may go on to consider the various types of estrogens which are commonly used in the United States today. We have made no attempt to include all the products available but will list only those products that are commonly used and only those whose methods of standardization are acceptable.

Some of these estrogens are concentrated extracts of physiologic fluids and tissues, others are partially synthetically made. At present we have no definite proof of any differences in the qualitative, clinical action of these various products. The difference is quantitative, and, if the physician will be guided by his knowledge of the various units of standardization employed, he may safely choose that particular estrogen which may be secured at the lowest economic cost per unit.

I Estrone. Hydroxy-keto-estratriene. Obtained from the urine of pregnant mares and women. Available as the purified urinary extract and as an oily solution of the crystalline substance. The purified extracts contain small amounts of estrone and estradiol. All products are in international units.

--------------------------	--------

POTENCY EVALUATIONS OF COMMERCIAL FEMALE HORMONE PREPARATIONS

BERNARD L. CINBERG, M D , and STANLEY F. GOLDMAN, M D , New York City

THE physician in general practice, in attempting to apply present-day knowledge of female hormone therapy, is often confused by the multitude of trade names applied to endocrine products*. This confusion has resulted in a difficulty on his part in correlating the specific hormone with its popularized pseudonym.

The purpose of this paper is an attempt to alleviate this confusion by grouping the more commonly used female hormones according to their chemical nomenclature and comparing this with their commercial name. In addition, an attempt will be made to explain the methods of standardization used, so that the busy physician can, at a glance, realize what the potency of a given endocrine product is.

If various commercial preparations are, in spite of their different names, essentially the same substance and if their methods of standardization are comparable, the physician will then be able to choose for his patients that particular preparation which is economically the most desirable one.

The use of unstandardized extracts is highly undesirable. We are not concerned with the fact that a 5-grain tablet is obtained from 1 pound of glandular tissue. We do, however, want to know if the 5-grain tablet is active, relatively active, or inert. Such information cannot be evaluated unless the actual potency of the preparation is standardized, directly or indirectly, by biologic assay. Consequently, we shall only consider those preparations that meet this qualification and whose potency can be measured by an acceptable yardstick.

It is not within the scope of this paper to consider the rationale of the various therapeutic methods in vogue at the present time, but it is essential to outline briefly our conceptions of the physiology of the more commonly used hormones.

Man, from birth to death, is constantly under the influence of varying hormonal concentrations, but woman, from pubescence to climacteric, is subjected, in addition, to the rhythmic influence of sex hormones. In the

adult menstruating woman the average menstrual cycle is one of twenty-eight to thirty days. The first three to five days are those of actual menstruation, then, up to the phenomenon of ovulation which occurs from the twelfth to the sixteenth day, the endometrium of the uterus is in what is called the "proliferative stage", after ovulation, the endometrium progresses through the so-called "secretory stage," to end up in menstruation once again.

The key to these endometrial phases is resident in the ovaries. Once a month, one or more graafian follicles are brought to maturation with the release of an ovum on the twelfth to the sixteenth day of the menstrual cycle, with the resultant formation of a corpus luteum. The maturing graafian follicle secretes an increasingly large amount of the estrogenic hormone, and, with the appearance of the corpus luteum, a second hormone, progesterin, is produced.

The estrogenic hormone is presumed to control the proliferative stage of the endometrium of the uterus, while progesterin controls the development of the secretory phase.

These ovarian hormones are, in turn, directly subject to the gonadotropic hormones of the anterior pituitary gland. The gonadotropic hormones are usually designated as prolactin A and prolactin B. Prolactin A, the follicle-stimulating hormone, controls the production of estrin, and prolactin B, the luteinizing hormone, exercises a like function for progesterin.

This is the much simplified current explanation of the physiology of three of the more commonly used hormones—namely, estrin, progesterin, and the gonadotropic hormones of the anterior pituitary gland. It should be remembered that the anterior lobe of the pituitary gland produces many other types of hormones, but, since this paper concerns itself only with the more commonly used endocrine preparations and their standardization, we shall mention these other hormones only in passing.

A fourth commonly used hormone, the anterior pituitary-like hormone, commonly called A.P.L., must here be discussed. This hormone is almost certainly made by the placenta and is found as an excretion product in the urine and blood of the pregnant woman. It

Presented before the Section of Obstetrics and Gynecology at The New York Academy of Medicine, January 23, 1940.

From the Endocrine Laboratories of the Beth Israel Hospital.

acquainted with the definition of a rat unit of that particular commercial house

As a general rule, all rat units consist of that amount, or fraction of that amount, of gonadotropic material which will produce an evidence of maturity when injected into immature female white rats. These evidences of maturity are quite varied. One group of firms chooses the appearance of vaginal or smear estrus as their criterion of maturity. Another group of drug houses uses the appearance of follicles and corpora lutea as the required evidence. A third group requires a specific increase of weight of the ovaries, while a fourth group demands a combination of several of the above criteria.

Since each of these evidences of maturity requires a different amount of chorionic gonadotropin to produce it, it is easy to understand why these chorionic gonadotropic rat units must necessarily differ. Furthermore, it should be remembered that the commonly used white laboratory rat will mature spontaneously at the age of 48 to 52 days. Consequently, if one drug house will decide to work with 22-day-old rats and another with 32-day-old rats, it may be assumed that it will require much less chorionic gonadotropic material to bring the older rat to maturity than will be required to produce the same maturity in a younger rat.

As all these variables are present in the standardization of the chorionic gonadotropic products, it is impossible to compare one rat unit to the other on terms of definition alone. To facilitate a comparison of these units so that the physician using these endocrine products may be certain of their potency, we have chosen a method of standardization which, in our hands, was the most delicate and practical to use. We then assayed all the commercial forms of the chorionic gonadotropin commonly used by this method, and, by arbitrarily designating our rat unit as unity, we are able to give a comparison of the commercial chorionic gonadotropic rat units, as their potency compares to our standard rat unit (see Table I).

Since the completion of these experiments, the League of Nations Health Organization has set up an international unit for the chorionic gonadotropic substances. It is designated as 0.1 mg. of a standard preparation of chorionic gonadotropic material. This unit is supposed to produce the estrus type of vaginal smear in 21-day-old rats.

The adoption of the international unit in the standardization of the commercial chori-

* Our assays revealed marked potency variations in individual ampules.

onic gonadotropic preparations will clear the existing confusion caused by the use of unequal rat units.

Gonadotropic Hormones of the Anterior Pituitary Gland

The administration of the chorionic gonadotropins has produced ovulation in rodents, while the combined use of pituitary gonadotropic hormones and chorionic gonadotropic substances has accomplished this in *Macacus rhesus*.⁴ But attempts to produce ovulation in woman have been signally unsuccessful by the use of these products either singly or in combination.^{5,6}

However, successful production of ovulation in woman by the intravenous use of a gonadotropic substance obtained from the serum of pregnant mares has been reported. This product has only recently become available commercially.⁷

The gonadotropic hormones are obtained by extraction from the anterior pituitary gland and are standardized in rat units. These units vary greatly, since each commercial house defines them differently. They are all, with one exception, based upon the production of an increase in weight of the ovaries of the test animal.⁸

One of the typical units is defined as the smallest amount of material which, when divided into six equal parts and injected over a period of three days into immature female animals less than 30 days old and weighing from 35 to 40 Gm., will, on the fifth day, produce follicular maturation and luteinization of the ovaries and a marked increase in the size of the ovaries and uterus in at least 60 per cent of the animals so treated.

We obtained our preparations from reliable retail drug houses and proceeded to assay them in terms of the manufacturers' unit, using, however, 10 rat units in an attempt to produce the ovarian changes claimed for 1 rat unit.

There are five commercial preparations of the pituitary gonadotropic hormones. In

 synthetic esterification of estradiol
 (A) Follacro (R U)

VI Emmenin

An extract of human placenta, which is orally active in rodents. Chemically, it is a combination of glycuronides of the estrogens, principally of estriol. It is assayed by oral administration to immature rats, consequently, its unit may not be compared to any of the other estrogenic units.

We have found all the estrone preparations to be uniformly potent. The minor variations we have encountered from time to time are probably due to differences in assay technique.

It should be noted that our list of the estrone products contains eight different names for nine preparations that are all essentially the same substance. One can readily understand the confusion that has resulted from this multiplicity of names. If the manufacturers would label these products estrone, followed by the firm name, this confusion would be avoided.

The estriol and estradiol preparations are intended for oral usage, yet, the manufacturers standardize them parenterally. It requires a greater amount of estrogen used orally to produce a given change than it does to produce this same change with the same estrogen used parenterally. All preparations that are intended for oral use should be standardized orally, but the only one that fulfills this essential requirement is emmenin. This product has not been assayed by us because of the technical difficulties inherent in a rodent feeding experiment.

The estradiol benzoate and estradiol propionate preparations were uniformly potent.

Progesterin

This hormone is standardized in three units. The most commonly used one is the international unit. An international unit is 1 mg of progesterone, which is crystalline progesterin of a standard quality. Its chemical formula is shown in Fig. 4.

Another unit is the Corner-Allen rabbit unit. This is the minimum quantity of progesterin which, when divided into five equal daily doses, will produce in an adult rabbit a state of the uterine endometrium equal to that produced by an eight-day-old pregnancy.

The third unit is the Clauberg or European rabbit unit, which utilizes a smaller rabbit than does the Corner-Allen rabbit unit.

Again it is necessary to find a common meeting ground for these various units, so it should be remembered that an international unit is equal to a Corner-Allen rabbit unit. The potency of the European rabbit unit is much disputed, but it probably is equal to one-half the American or Corner-Allen rabbit unit.¹

Progesterin is obtained in two ways at the present time. The original method is the extraction of the corpora lutea of the sow, the newer method is entirely a synthetic process. We choose to point out here, once more, that we are unable to demonstrate any practical differences in the products obtained by these different methods. We are concerned only with their relative potency. (I) Crinolutin—glandular extract, (II) Lipo-Lutin—extract, (III) Lutromone—glandular extract, (IV) Progesterin—synthetic, (V) Progesterin—glandular extract, (VI) Progesterin in Oil—extract, (VII) Progesterone—synthetic, and (VIII) Proluton—synthetic.

Here again, we have seven different names for eight products that are essentially the same substance. The progesterin preparations that we assayed, whether extracts or synthetic crystals in oil, were all found to be of labeled potency.

Chorionic Gonadotropins

The third endocrine product to be classified is the anterior pituitary-like hormone. The correct name is the chorionic gonadotropin of human pregnancy urine. Its qualities have already been described briefly. We merely wish to reiterate here that it is not the same substance as the gonadotropic hormone of the anterior pituitary gland and that in rodents² and monkeys³ there is overwhelming evidence that their biologic actions are considerably different. The chorionic gonadotropin is secured from two sources: from the urine of pregnant women and from the placenta, while the anterior pituitary gonadotropin is extracted from the gland itself. The exact chemical formulas are unknown.

There are seven commercial firms that manufacture the more commonly used chorionic gonadotropic products under various trade names. All these commercial chorionic gonadotropins are standardized in rat units, but each of the rat units used by the seven houses differs from the others. In other words, the phrase "rat unit" has no definite meaning when one discusses a chorionic gonadotropic product unless the speaker is

THE CLINICAL APPLICATION OF SECRETIN IN THE STUDY OF PANCREATIC FUNCTION

JOSEPH S. DIAMOND, M.D., and SIGMUND A. SIEGEL, M.D., New York City

SINCE Baylis and Starling in 1902 discovered the presence of secretin in the small intestine and noted its specific effect upon the excretory cells of the pancreas, many attempts have been made to isolate this hormone in a pure form so that it might be utilized clinically in man. It was not until 1933, however, that Hammarsten^{1,2} succeeded in preparing a pure crystalline salt of secretin. In 1937 Agren and Hammarsten³ finally devised a more simplified method for the production of secretin, which made possible its use for general clinical purposes. Pharmacologically, it closely resembles the crystalline product. It is free from histamine and other undesirable products that made the use of the earlier preparations prohibitive. In our own experience of 116 tests carried out with secretin, many of which have been repeated, no untoward effects have ever been noted. An occasional transient flushing of the face may be seen. The product is also free from cholecystokinin, the gallbladder contracting principle.

The basic difficulties in the past in studying pancreatic function have been the lack of a standard stimulus to the pancreas and the difficulty in obtaining pure pancreatic juice uncontaminated with gastric chyme. In the previous work on the study of duodenal enzymes by McClure,⁴ Christiansen,⁵ Crohn,⁶ and Myers,⁷ stimuli were introduced in the form of food and chemicals, and various specimens were withdrawn and examined at different intervals. The admixture of the acid gastric chyme lowered the pH of the duodenal juices and gave no true indication of the bicarbonate concentration or the total enzyme output.

These difficulties have now been overcome by the use of secretin and a double gastroduodenal tube. Secretin supplies a strong pancreatic stimulus, and the double tube provides for the separate collection of the duodenal and gastric juices. We are thus enabled to obtain a clear, uncontaminated, pancreatic secretion. This method has made it possible for the first time to study clinically

the bicarbonate concentration of the pancreatic juice in man as obtained from the duodenum. The method also permits the collection of the entire pancreatic output during the test period for total quantitative determinations.

In a previous communication⁸ we have described at length the procedure of the test. Briefly stated, the free end of the double tube is permitted under fluoroscopic guidance to enter the duodenum as far as the third portion, while the shorter end, attached 10 inches higher, remains in the stomach. Since engaged in this work we have been able to shorten considerably the period of duodenal intubation. Working under the fluoroscope with the patient in an erect posture, we can quickly correct kinking at the cardia and guide the tube to the pylorus. With manual pressure upward at the greater curvature and antrum the tube usually slips through the pylorus. Both ends of the tube are provided with many apertures. By means of a gentle suction not exceeding 50 mm. of mercury, both pancreatic and gastric secretions are obtained separately and completely.

After obtaining a basal flow during a period of twenty to twenty-five minutes, secretin is injected intravenously (0.75 mg. per kilogram of body weight). We have increased the submaximal dose of 0.5 mg. used in our earlier work to 0.75 mg. so as to subject the pancreas to a maximal stimulus. Within a minute or two following the injection there is an outpouring of pancreatic juice (Fig. 1) that quickly loses its bile discoloration and usually remains colorless throughout the greater period of the test. A deeply bile-stained secretion throughout the entire test period indicates a diseased and nonfunctioning gallbladder, whereas a clear opalescent juice indicates a normally functioning viscus, the bile entering the gallbladder and being stored there.⁹ The secretion collected is rich in bicarbonate (Fig. 2) and enzymes (Fig. 3)—amylase, trypsin, and lipase.

The Test

Following the injection of secretin, the test is carried out for one hour. The evaluation of pancreatic function following secretin depends upon the following factors: volume of

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 9, 1940.
From the Sydenham Hospital.

This work was aided by the Dr. Max Rosenthal Research Fund.

testing these preparations by the method previously outlined, we found that four of them were ineffectual. The fifth, the "Gonadotropic Factor of Ayerst," was effective only when ten times the stated amount of material was used, but, when the exact quantity as defined by their rat unit was employed, our results were negative. It should be noted at this point that the Ayerst unit is defined as one-tenth of that amount of material which, when administered daily in three divided doses, will cause a certain increase in the weight of the ovaries. This unit must, therefore, be regarded as exceedingly small.

Since we employed ten times the amount of material that the commercial houses utilized to produce a given result, it would appear that those products that in our hands did not produce any ovarian changes were impotent.

The available pituitary gonadotropic hormones are (1) ambinon, (2) gonadotropic factor, (3) gynantrin, (4) prephysin, and (5) prepituitary-G.

Summary and Conclusions

An attempt has been made to enumerate and classify the more commonly used female hormones.

Whenever possible, the chemical structure, the accepted nomenclature and the commercial trade names have been designated.

The standardization of the products discussed has been explained, and, as far as possible, comparison of their potencies has been made.

The potency of the estrogenic preparations has been discussed. We feel that the estrone, estradiol benzoate, and estradiol propionate products are of labeled potency. The estrinol and estradiol products are standardized parenterally, although they are intended for oral usage.

All the progestin products we assayed were uniformly potent and well up to their labeled standard.

The rat unit of the commercial chorionic gonadotropins has been evaluated by a series of experiments.

The potency of the pituitary gonadotropic hormones has been assayed and found to be below the standard necessary for practical usage. Our assays indicate that the pituitary gonadotropic substances are inefficacious by the time they reach the dispensing physician. We do not feel that the use of these products, at least for the present, can be recommended for the production of ovulation in women.

ALUMNI DAY—LONG ISLAND COLLEGE OF MEDICINE

The Alumni Day of the Long Island College of Medicine will be celebrated on Saturday, April 26, 1941, at the Medical School. Round Table discussions between 10:00 and 11:00 A. M. will be given by the departments of anatomy, chemistry, obstetrics and gynecology, pathology, surgery, pediatrics, physiology, and radiology.

Beginning at 11:00 A. M. the alumni will be "welcomed" by Dr. Jean A. Curran, dean of the Medical School, Dr. William P. Healy will speak on "Pelvic Malignancies," and Dr. Frank E. A'dair, on "The Place of the Radiation Program in the Field of Mammary Carcinoma." Following luncheon in the main dining room of the hospital, Dr. Perry M. Lichtenstein will speak on "Psychopathic Criminals."

The annual banquet will take place at 7:30 P. M. at the Knights of Columbus Club, 1 Park West, Brooklyn, New York. The Honorable William O'Dwyer, District Attorney, Kings County, will be the speaker.

A POLISH MEDICAL SCHOOL IN EDINBURGH

The University of Edinburgh has offered to the Polish Government facilities, which have been cordially accepted, for the establishment in Edinburgh of a Polish School of Medicine (*Brit M J*, Jan 25, 1941). It will be staffed by professors and teachers now serving with the Polish Army in Britain and by professors of the Edinburgh faculty of medicine in such basic subjects as may not be represented among the Polish professors. Discussions are in progress between representatives of the Polish Government and of the University of Edinburgh to settle details of the scheme. The University has gladly undertaken to provide accommodation and material to the utmost of its power, and the city authorities have informally indicated that they will co-operate in the provision of opportunities for clinical instruction. By establishing the nucleus of a Polish faculty of medicine in Edinburgh one of the most important branches of Polish learning—medical research and teaching—will be kept alive.

bicarbonate, 90 to 130 milliequivalent, amylase 300 to 1,200 units (5.5 to 11 units/kilogram/60 minutes), trypsin 20 to 40 units (0.35 to 0.7 unit/kilogram/60 minutes), and lipase 7,000 to 14,000 units (135 to 225 units/kilogram/60 minutes) (In the eighty-minute test period the standards are one-eighth higher for volume, one-fifth higher for the enzymes, bicarbonate remains unchanged.)

The present report consists of 116 secretin tests performed on 90 patients. In 19 cases the test was repeated from two to four times, in 12 cases, twice, in 5 cases, three times, in two cases, four times.

There were 24 normal individuals and 66 pathologic cases. The normals include students, physicians, and a number of patients with unrelated ailments such as constipation, hemorrhoids, sciatica, psychoneurosis.

With the exception of three instances in apparently normal students, the results of the tests were uniform in all, corresponding to the established normal standards. These 3 individuals gave surprisingly low figures for volume and enzymes. We have, nevertheless, included them in the normal group, although on closer questioning we obtained a history of a prolonged illness, with chronic diarrhea during childhood in one and, in the other two, previous histories of vague digestive disturbances.

The Secretin Response in Pathologic Cases

In pathologic states, any of the functions above enumerated may be affected. The enzyme production is the first to suffer in the damaged pancreas. The volume of juice and the bicarbonate concentration are fairly constant and not easily disturbed, the bicarbonate least of all.

The enzymes also may become dissociated so that only one may be affected while the others remain normal. This is mostly observed in the milder states. The lipase and amylase are most frequently disturbed. In the severer states, such as pancreatitis with

necrosis, cirrhosis of the pancreas, or mechanical obstruction of the pancreatic duct, all functions are simultaneously involved.

The pathologic material subjected to the secretin test consists of the following 66 cases:

Pancreatitis

Hemorrhagic pancreatitis with fat necrosis	1
Edema of the pancreas	1
Chronic pancreatitis	1

Obstructive jaundice

Carcinoma of the head of the pancreas	3
Carcinoma of the biliary ducts	2
Atresia of the common duct	1

Cholelithiasis

Cysts of the pancreas	3
-----------------------	---

Cirrhosis of the liver with syphilis

Splenomegaly with syphilis	1
----------------------------	---

Toxic hepatitis (2 with syphilis)

Acute yellow atrophy of liver (syphilis)	1
--	---

Steatorrhea

Diabetes	14
----------	----

Miscellaneous

Postcholecystectomies, colitis, spontaneous cholecystoduodenal fistula, chronic nephritis, etc.	3
---	---

Postcholecystectomies, colitis, spontaneous cholecystoduodenal fistula, chronic nephritis, etc.

Pancreatitis—One case of hemorrhagic pancreatitis was examined seven weeks after the operation while still discharging from a cholecystostomy sinus. The findings indicated a marked deficiency in all the functions including volume, bicarbonate, and enzymes. Some of the enzymes were as low as one-eighth to one-fifteenth of the normal. The pancreatic juice was admixed with considerable pus. Subsequent examinations made four months and ten months later revealed considerable improvement in the function. The output, however, of the volume and enzymes still remained one-half of the normal.

The case of chronic pancreatitis presented several attacks of recurrent jaundice. Examination with secretin during one of these episodes revealed low bicarbonate, amylase, lipase, and also a high blood lipase.

The patient with edema of the pancreas, who had long-standing diabetes and cholelithiasis, presented a typical clinical picture of marked, left upper quadrant tenderness and high blood amylase and lipase. A secretin

flow, concentration of bicarbonate, and concentration and total quantity of enzymes—amylase, trypsin, and lipase

A total secretion varying between 150 to 250 cc of juice is collected during one hour. The maximum flow takes place within the first ten minutes, gradually coming down and reaching the basal level in about eighty minutes.

The bicarbonate content is estimated by titration and is expressed in milliequivalents per liter. It reaches its maximum concentra-

FIG 3

tion at the end of the twenty-minute period and varies between 96 and 120 milliequivalents.

The enzymes are quantitatively estimated using the following methods: for amylase—Norby's¹⁰ method modified for duodenal contents, for trypsin—Willstätter's¹¹ method, for lipase—the method of Cherry and Crandall,¹² modified by Comfort and Osterberg,¹³ using 1:10 dilution. The presence of bile does not affect enzyme activity.

For the evaluation of the function of the pancreas it is necessary to estimate the total output of the enzymes during the test period. This is obtained by multiplying the concentration by the total volume.

The total volume and total bicarbonate concentration are directly proportional to the amount of secretin used. The greater the dosage, the larger the volume and bicarbonate output. The behavior of the enzymes is different. The concentration is inversely proportional to the rate of flow. After a washing out of the preformed enzymes stored within the ducts and cells of the pancreas, the concentration falls to a lower level and remains fairly constant throughout the test, rising only toward the end when the volume is diminished. In the normal state the enzymes run parallel to one another (Fig 3).

In our previous report the duration of the test was eighty minutes. We have since reduced the test period to sixty minutes. The normal standards for the one-hour test period are as follows: volume, 135 to 250 cc (21 to 45 cc per kilogram/60 minutes),

these 2 instances with positive Wassermann, the pancreatic function was markedly disturbed, all enzymes being diminished. The third case was a milder form with negative serology, ascites, and a palpable spleen. This patient responded favorably to therapy, the ascites disappearing. The test here showed only diminished bicarbonate but no interference with the volume or enzyme output.

Splenomegaly—In 1 case of splenomegaly with syphilis and a secondary anemia, only the lipase was diminished. Otherwise the findings were normal.

Toxic Hepatitis—There were 5 cases in this group—2 complicated with syphilis. In these 2 instances the secretin test revealed marked disturbance in the pancreatic function with diminution of enzymes. In 1 of these cases the test was repeated four times, with similar findings even after the jaundice had cleared. In the other 3 cases the tests were normal, with the exception of 1 instance of a more severe type where the lipase was diminished.

Acute Yellow Atrophy of the Liver—There was 1 case of acute yellow atrophy of the liver. This patient came to the hospital with jaundice that had developed after neoarsphenamine treatment for syphilis. Symptoms were moderate at first, and the patient received the usual treatment with intensive glucose therapy and sodium thiosulfate. The secretin test was performed during this period. It revealed a marked deficiency, affecting all the functions—the volume, bicarbonate, and all the enzymes. The following day the patient became drowsy and listless. The cholesterol was low, the ester dropped to zero. The patient rapidly developed the typical clinical picture of acute yellow atrophy and succumbed five days later. The autopsy confirmed the clinical diagnosis. The pancreas revealed edema and slight fibrosis but no necrosis. Evidently the depressed function was due to the same toxin.

Steatorrhea—There were 14 cases of steatorrhea comprising 8 severe forms requiring hospitalization and 6 milder ambulatory types. All these patients were subjected to thorough clinical investigation, including quantitative fat studies in the stool, hematologic studies, blood chemistry, and roentgen studies of the gastrointestinal tract and bones. (A detailed study of this work will be reported subsequently.)

The clinical picture was that of sprue and they were so regarded. The severe forms presented frequent, large, bulky, fatty stools with marked nutritional disturbances, emaciation,

and anemia. The milder forms presented vague digestive symptoms and intermittent attacks of diarrhea, in these patients, however, the nutritional disturbances were not marked.

The secretin studies revealed the following: In 10 cases, including 6 severe types and 4 ambulatory, there were varying degrees of pancreatic deficiency involving particularly the lipase. In addition, 5 also showed low volumes, 1, low bicarbonate, 2, low amylase, 5, low trypsin. All 10 showed lipase deficiency. In the remaining 4 cases, 3 of which were severe forms and 1 ambulatory, the pancreatic function was entirely normal as to volume, bicarbonate, and all enzymes. In 5 instances the test was repeated from two to four times.

We feel that the 4 cases that showed normal pancreatic function can be regarded as cases of sprue or idiopathic steatorrhea, while the other cases that showed such profound lipase deficiencies may be regarded as steatorrhea associated with pancreatic lesions. In the severe cases that received active treatment with diet, transfusion, and liver therapy with the improvement of the patient, the pancreatic function also showed restoration to normal values. In this connection it may be stated that Andersen¹⁴ has collected a group of 49 cases of cystic fibrosis of the pancreas with autopsy findings in whom the clinical picture during life was that of coeliac disease.

The similarity of the clinical picture in the steatorrheas makes the condition a difficult one for differential diagnosis, and the readiness with which one type can be mistaken for the other becomes obvious. In secretin we have a fairly simple procedure that provides a sharp line of differentiation between the cases of steatorrhea showing normal pancreatic function and those in which the pancreatic function is deficient.

Diabetes—There were 3 cases of diabetes. Two were associated with gallstones, and 1 entered the hospital with acute edema of the pancreas with high blood amylase and lipase. The secretin test was performed after clinical improvement when the diabetes was under full control with insulin and dietary regimen. The findings revealed in 1 case a low lipase and in the other 2 cases low bicarbonate. Two cases, in addition, had nonfunctioning gallbladders.

Miscellaneous—This group included 4 cases in whom cholecystectomy had been performed. All responded normally to the secretin test. One case of spontaneous cholecystoduodenal fistula showed a lowered bicarbonate but was

study three weeks afterward, when apparent clinical recovery had taken place, showed low bicarbonate and extremely low normal figures for amylase and trypsin (Table 1)

Obstructive Jaundice—This group includes 3 cases of carcinoma of the head of the pancreas, 2 cases of carcinoma of the biliary ducts, and 1 case of atresia of the common duct post-operatively. All of these cases were operated upon with the exception of 1 case of carcinoma of the head of the pancreas. One case of carcinoma of the head of the pancreas came to autopsy.

These 3 cases of carcinoma of the pancreas showed marked deficiency in the function of the pancreas. The tests were repeated twice. In 1 case all the enzymes were entirely absent and the bicarbonate output was as low as 10 milliequivalent per liter. In the second case the autopsy revealed the tumor so situated that it compressed the common duct but not the pancreatic duct. Here we found a diminished volume and a marked diminution in the trypsin and lipase output. The third patient, who was not operated upon, presented a clinical picture of unmistakable diagnosis. A large, hard, immovable mass was felt in the left upper quadrant, producing in the x-ray a pressure defect in the stomach. There was also a distended, palpable gallbladder. The first test showed practically no response to secretin. The second test, four months later, showed considerable free blood in the duodenal contents with mitotic cells seen under the microscope. The secretin injections in this instance were followed by colicky pains of short duration.

In the group with carcinoma of the biliary ducts the operation revealed 1 case with a primary lesion in the common bile duct and the second with carcinoma of the hepatic

ducts. The secretin test gave entirely normal findings in the common duct lesion, indicating a noninvolved pancreas and a patent pancreatic duct. In this instance the test was of great value in definitely ruling out a pancreatic lesion. The second also gave normal volume and bicarbonate, showing only a slight diminution in the amylase and trypsin.

In the atresia of the common duct post-operatively, the test was repeated four times. In all instances the test gave normal pancreatic findings (Table 2).

Cholelithiasis—Fourteen cases of cholelithiasis were examined. Twelve came to operation. Five had stones in the common duct with jaundice. One developed liver abscess. 2 were associated with diabetes, 1 of which had acute edema of the pancreas, and 1 case had intermittent attacks of fatty stools and diarrhea. All of the cases that presented complications revealed varying degrees of pancreatic deficiency. Five presented low amylase, 3 had low trypsin, 5 had low lipase, 2 had low volume, and 2 had low bicarbonate. Five uncomplicated cases gave normal figures.

Cyst of the Pancreas—There were 3 cases of cysts of the pancreas. All were operated upon. One was examined while still in the hospital with a persistent pancreatic fistula. This patient showed marked interference in function, the juice being collected from the duodenum as well as from the fistula. When the test was repeated five weeks later the results showed some improvement, still, however, below normal.

The other 2 cases showed only moderate interference in function.

Cirrhosis of Liver—There were 3 cases of cirrhosis of the liver, 2 with positive serology. They were fairly advanced cases with ascites and splenomegaly, and 1 was jaundiced. In

learned from this work that the enzymes are first to suffer in pancreatic disease. The enzymes may be dissociated, and, therefore, it is important to study all of them in each case. In severe gross lesions of the pancreas, such as pancreatitis with necrosis, cirrhosis of the pancreas, and obstruction of the ducts, all functions are involved, the volume and the bicarbonate content of the pancreatic juice being depressed as well as the enzyme. Since in these diseases the secretin test findings are constant on repeated examination, it would seem that the pancreas has not the regenerative power that is possessed by the liver when it is damaged.

(3) *Silent Disease of the Pancreas*—By means of the secretin test, silent disease of the pancreas is revealed in such conditions as cirrhosis of the liver, toxic hepatitis with syphilis, and acute yellow atrophy. This opens up what seems to be a new field well worthy of further exploration.

(4) *Obstructive Lesions*—In obstructive lesions of the bile and pancreatic ducts the test helps to localize the lesion, thus making differential diagnosis easier than it has ever been before.

In conclusion, I would like to thank Dr. Diamond and his collaborator for the opportunity to follow this pioneer work which is of such great scientific and clinical promise.

Dr. Henry Doubilet, *New York City*—This paper by Dr. Diamond and several papers previously published by him form a landmark in the diagnosis of diseases of the pancreas. This presentation clearly shows that the secretin test is of diagnostic value, both from medical and surgical aspects. The group of cases usually discussed as chronic steatorrhea can now be divided into those that suffer from pancreatic insufficiency and into a nonspecific group. In patients suffering from obstructive jaundice, a differential diagnosis can now be made preoperatively between carcinoma of the hepatic ducts and carcinoma of the head of the pancreas.

It is obvious that when the differential diagnosis can be made the therapy can be more specific. In addition, we now have a means of flushing out the pancreas just as we can now flush out the liver by various stimulating substances. In cases of acute pancreatitis not only can we treat the patients after their initial recovery but we can also follow up the progress or their recovery.

In my opinion, however, the most valuable aspect of this paper is that it focuses attention on the duodenal hormones as a group and gives definite indication not only that a secretin can be of great diagnostic and therapeutic importance but also that the other hormones, such as cholecystokinin and enterogastrolin, will some day prove to be of great value once they are purified.

Dr. Anthony Bassler, *New York City*—I compliment Dr. Diamond on the courage and interest he has shown in the test he has described. Because of the many variables met with and the

interrelationships with other organ functions, this pancreas work is a difficult subject in which to make definite deductions. I note he uses chemical tests for enzymes which are proverbially unreliable. The microscopic observation of a mixture of a weak alkaline solution with neutral fat will show every reduction that lipase does, as shown in 1924. The proteolytic enzyme depends upon enterokinase from the duodenal mucosa to activate it. The only enzyme that flows as such out of the pancreas is amylase. When he states that there is dissociation between the enzymes of the pancreas, he is assuming it from these nonreliable chemical tests. The charts of Dr. Diamond in pathologic conditions showing that all the enzymes are low in disease proves, what I brought out in 1925, that in disease there is no dissociation between them. The alkalinity of pancreatic juice is due to sodium carbonate, not bicarbonate. While secretin, as Bayliss and Starling suggested and perhaps even a synthetic form, may cause a flow of pancreatic juice when introduced into veins, I still feel that duodenal stimulation by food substances is the better method of obtaining a specimen for clinical work. This work has not received the interest and investigation that it deserves, and every effort to elucidate the subject is to be commended. That there is distinct clinical value to it has been proved by a constant continuation with the method I advanced in 1925, which, while not 100 per cent perfect, is still clinically useful in many digestive disorders, in diabetes, and rather generally in nutritional and endocrine work.

Dr. Joseph S. Diamond (*Concluding Remarks*)—I wish to thank the discussors for their interesting comments. With regard to Dr. Bassler's criticism of the tests I regret to say that he appears to be entirely unfamiliar with the high degree of accuracy of these quantitative methods. The Norby method for amylase determination and the Willstätter method for proteolytic enzyme action are standard quantitative procedures and are universally used by enzyme chemists. The lipase method is the original Cherry and Crandall method. It is widely used in this country.

Furthermore, the dissociation of enzymes in pathologic states of the pancreas has already been substantiated by many workers in this field including Ivy, Comfort, Churay, and others.

Finally, the advantage of an intravenous secretin stimulus over the crude use of food stimuli is self-evident, as in the former method, aided by the double gastroduodenal tube, a pure pancreatic secretion is obtained which can be quantitatively estimated as to volume, alkalinity, and enzyme activity. The use of food stimuli introduced into the duodenum is a crude method resulting in contamination with gastric juice and does not lend itself to accurate quantitative studies.

otherwise normal. One case had a markedly enlarged and hard liver and revealed a low bicarbonate and low lipase. This group also included 4 young men with digestive disturbance and negative gastrointestinal findings. The secretin test in all cases showed deficient function, involving the volume, trypsin, and lipase in each, the amylase in 3, and the bicarbonate in 1. In 2 patients the test was repeated with similar results. Another patient in this group was a young man who suffered from attacks of syncope. During one of these episodes a blood sugar revealed a hypoglycemia of 50 mg. Inasmuch as a possible adenoma of the pancreas was suspected, the secretin test was performed and repeated after an interval of three weeks. All the functions except the bicarbonate were markedly diminished in both tests. The final diagnosis as to the nature of the lesion still remains unconfirmed.

Summary and Conclusions

Secretin provides a potent and standard stimulus to the pancreas. When injected intravenously in a dose of 0.75 mg. per kilogram of body weight, it causes a marked flow of pancreatic juice. By means of the double gastroduodenal tube one can obtain a clear uncontaminated juice rich in bicarbonate and enzymes. These are quantitatively estimated for a one-hour period, and the results are evaluated according to established normal standards.

In pathologic states of the pancreas the enzyme production first becomes affected. The volume and bicarbonate are more stable and are less easily disturbed. The enzymes may become dissociated so that one enzyme may be more affected than the others. In severe lesions all functions are simultaneously involved.

A series of 116 tests have been performed on 90 patients, of which 24 were normal and 66 comprised various pathologic conditions.

In silent lesions of the pancreas the test has been of inestimable value in detecting disturbances in function of the gland which were hitherto unrecognized and unsuspected. In syphilis, chronic alcoholism, hepatic cirrhosis, toxic states, and acute yellow atrophy of the liver the test has revealed various degrees of disturbed function.

In obstructive lesions of the common bile duct and pancreatic duct the test helps to differentiate the location of the lesion and the degree of obstruction.

In the group of fatty diarrheas the test helps

to differentiate the steatorrheas with pancreatic deficiencies from those of sprue and idiopathic forms.

In the group of fatty diarrheas the test helps to differentiate the steatorrheas with pancreatic deficiencies from those of sprue and idiopathic forms.

In the follow-up studies the test has shown the reversibility of the function and has been consistent with the clinical improvement of the patient indicating the degree of recovery.

In studying the icterus index of the duodenal juice obtained during the secretin stimulation, one can incidentally establish, with a high degree of accuracy, a normally functioning gallbladder from a diseased nonfunctioning viscous.

We wish to thank Dr. G. Elias and Mrs. L. Schmidt for their valuable technical assistance in the laboratory.

Discussion

Dr. John L. Kantor, *New York City*—Dr. Diamond's work opens up a new era in the study of the pancreas. I should like to confine my remarks to the following:

(1) *Technic*—Dr. Diamond has demonstrated that the duodenal tube can be slipped into the stomach much more quickly with the patient in the erect, rather than in the prone, position. This saves much time in the preliminary phase of the test. By shortening the test period itself from eighty to sixty minutes, he has further abbreviated the time by 25 per cent and, therefore, has made the examination much more practical.

(2) *Evaluation of the Secretin Test*—We have

learned from this work that the enzymes are first to suffer in pancreatic disease. The enzymes may be dissociated, and, therefore, it is important to study all of them in each case. In severe gross lesions of the pancreas, such as pancreatitis with necrosis, cirrhosis of the pancreas, and obstruction of the ducts, all functions are involved, the volume and the bicarbonate content of the pancreatic juice being depressed as well as the enzyme. Since in these diseases the secretin test findings are constant on repeated examination, it would seem that the pancreas has not the regenerative power that is possessed by the liver when it is damaged.

(3) *Silent Disease of the Pancreas*.—By means of the secretin test, silent disease of the pancreas is revealed in such conditions as cirrhosis of the liver, toxic hepatitis with syphilis, and acute yellow atrophy. This opens up what seems to be a new field well worthy of further exploration.

(4) *Obstructive Lesions*.—In obstructive lesions of the bile and pancreatic ducts the test helps to localize the lesion, thus making differential diagnosis easier than it has ever been before.

In conclusion, I would like to thank Dr. Diamond and his collaborator for the opportunity to follow this pioneer work which is of such great scientific and clinical promise.

Dr. Henry Doubilet, *New York City*.—This paper by Dr. Diamond and several papers previously published by him form a landmark in the diagnosis of diseases of the pancreas. This presentation clearly shows that the secretin test is of diagnostic value, both from medical and surgical aspects. The group of cases usually discussed as chronic steatorrheas can now be divided into those that suffer from pancreatic insufficiency and into a nonspecific group. In patients suffering from obstructive jaundice, a differential diagnosis can now be made preoperatively between carcinoma of the hepatic ducts and carcinoma of the head of the pancreas.

It is obvious that when the differential diagnosis can be made the therapy can be more specific. In addition, we now have a means of flushing out the pancreas just as we can now flush out the liver by various stimulating substances. In cases of acute pancreatitis not only can we treat the patients after their initial recovery but we can also follow up the progress or their recovery.

In my opinion, however, the most valuable aspect of this paper is that it focuses attention on the duodenal hormones as a group and gives definite indication not only that a secretin can be of great diagnostic and therapeutic importance but also that the other hormones, such as cholecystokinin and enterogastone, will some day prove to be of great value once they are purified.

Dr. Anthony Bassler, *New York City*.—I compliment Dr. Diamond on the courage and interest he has shown in the test he has described. Because of the many variables met with and the

interrelationships with other organ functions, this pancreas work is a difficult subject in which to make definite deductions. I note he uses chemical tests for enzymes which are proverbially unreliable. The microscopic observation of a mixture of a weak alkaline solution with neutral fat will show every reduction that lipase does, as shown in 1924. The proteolytic enzyme depends upon enterokinase from the duodenal mucosa to activate it. The only enzyme that flows as such out of the pancreas is amylase. When he states that there is dissociation between the enzymes of the pancreas, he is assuming it from these nonreliable chemical tests. The charts of Dr. Diamond in pathologic conditions showing that all the enzymes are low in disease proves, what I brought out in 1925, that in disease there is no dissociation between them. Discussion

Dr. John L. Kantor, New York City—Dr. Diamond's work opens up a new era in the study of the pancreas. I should like to confine my remarks to the following:

(1) *Technic*—Dr. Diamond has demonstrated that the duodenal tube can be slipped into the stomach much more quickly with the patient in the erect, rather than in the prone, position. This saves much time in the preliminary phase of the test. By shortening the test period itself from eighty to sixty minutes, he has further abbreviated the time by 25 per cent and, therefore, has made the examination much more practical.

(2) *Evaluation of the Secretin Test*—We have

FIG 1 CASE 1

FIG 2 CASE 2

ligation of a single ureter with septic or aseptic atrophy. Two of the patients showed changes that could have existed before operation, i.e. double pelvis with blunting of minor calices. Similar x-ray studies were not made preoperatively. Whether or not the incidence of such changes in the urinary tract is greater than would occur in a similar series with the same pelvic pathology, but not operated on, will be reported in a subsequent paper. It is interesting to note that in this series 7 cases showed anomalies of urinary anatomy. Another patient who had been cystoscoped preoperatively showed hydronephrosis in the right side. A panhysterectomy was performed for fibroids and the postoperative pyelogram showed no evidence of hydronephrosis.

Case Reports

Case 1 (Fig 1)—Mrs M S, a white married woman, aged 29, mother of three children, entered the Albany Hospital because of pain in her right lower quadrant, vaginal discharge, and irregular profuse vaginal bleeding. There was no fever, chills, vomiting or symptoms of the urinary system.

Physical examination revealed bilateral lower abdominal tenderness. The vagina was relaxed with mild cystocele. The cervix was lacerated and the uterus retroverted and adherent. There were bilateral adherent tender masses.

The urine contained a 1 plus albumin and 2 to 3 white blood cells per high-power field. The Wassermann test was negative.

Operation Panhysterectomy, bilateral salpingo-oophorectomy, appendicectomy.

Diagnosis Acute and chronic salpingo-oophoritis.

Hospital Course Uneventful sojourn.

An intravenous pyelogram showed dilatation of the kidney pelvis and calices and a moderate degree of hydronephrosis on either side.

Case 2 (Fig 2)—Mrs H P, a white married woman, aged 26, mother of one child, complained of pain in the lower part of the abdomen of eleven months' duration. She had had leukorrhea since the birth of the child and dysmenorrhea before the first day.

Physical examination showed tenderness low down on both sides, more on the right. Vagina was of marital type, cervix was lacerated, uterus, retroflexed and adherent, adnexa, tender and adherent.

The urine was negative, blood Wassermann was negative, urethral and cervical smears were positive.

Operation Panhysterectomy, bilateral salpingo-oophorectomy, appendicectomy.

Diagnosis Chronic pelvic inflammatory disease, bilateral hydrosalpingitis, retroflexed uterus.

Hospital Course Uneventful.

Intravenous urography showed hydronephrosis on right.

Conclusions

1. There were five known injuries to the urinary tract during 4,010 hysterectomies on the Gynecological Service of the Albany Hospital.

URINARY TRACT INJURIES DURING PANHYSTERECTOMY

ARTHUR J WALLINGFORD, M D , Albany, New York

THE purpose of this paper is to present the observations of urinary tracts of 100 patients whose uteri have been removed by the total, complete technic called panhysterectomy

The proposed advantages of the various operations for removal of the uterus have been presented in several papers during recent years. The publications have been in a general sense devoted to the relative merits of subtotal or supravaginal removal of the uterus *versus* total removal or panhysterectomy by the abdominal route. Among the principal points enumerated have been the incidence of injuries to adjoining structures, particularly the bladder and ureters, during the removal of the uterus for benign, as well as malignant, lesions of that organ.

In a review of the recent literature on hysterectomies, one can readily note that the discussion is devoted to the morbidity and mortality rates of one method of removal of the uterus over the other. It is obvious that when the morbidity rate increases the mortality rate must necessarily also increase. The proponents of subtotal hysterectomy maintain that their complications are less numerous. On the other hand, the champions of the total hysterectomy maintain that in the hands of well-trained individuals the morbidity is less than for supravaginal hysterectomy. In addition, they also maintain that the cervix left behind is not only a source of leukorrheal discharge and of acute and chronic infection, specific and nonspecific, but that the cervix is also a site for malignant changes. A paper presented by McDonald¹ showed that in over 2,600 consecutive panhysterectomies, performed on the Gynecological Service of the Albany Hospital by ten different operators including the five residents, the mortality rate was less than the incidence of stump carcinoma. The mortality rate was 1.02 per cent. Of 2,355 complete hysterectomies for benign conditions, the operative mortality was 0.67 per cent. The incidence of stump cancer as reported by von Graff² was 4.1 per cent in 4,269 cases of cancer of the

cervix. The other arguments advanced for our belief in panhysterectomy have been presented by McDonald in another paper. During the discussion of that paper it was observed that injuries to the urinary tract, diagnosed and undiagnosed, were not uncommon complications.

The injuries of the bladder and ureters are frequently discovered at postmortem examination if not repaired at the time of operation. At other times the presence of ureteral or vesical fistulas soon make themselves evident. Yet, on other occasions, as reported by several authors, there is the unrecognized aseptic atrophy of one kidney when the corresponding ureter has been ligated.

A study of 4,010 consecutive hysterectomies performed in the Albany Hospital (Gynecological Service) over a thirteen-year period from January 1, 1926, to December 31, 1938, revealed five known injuries to the urinary tract, 3,750, or 93 per cent, of these operations were the total complete hysterectomy or panhysterectomy. Admitting the possibility of undiagnosed injuries, such as ligation of one ureter, the following study was made.

One hundred cases of panhysterectomies performed by two residents on the Gynecological Service of the Albany Hospital were selected. The pathologic indications for these operations were generally of a benign character, such as fibroids, pelvic inflammatory disease, endometriosis, and an occasional tubal pregnancy. Careful studies were made of the urinary symptoms before operations, during the convalescent period, and postoperatively. Burning, frequency, and nocturia were the chief preoperative complaints in 24 cases. Sixteen complained of the same symptoms postoperatively. There were no cases of pyelitis. There were 3 patients who complained of lumbar pain, one of these showed definite changes on x-ray studies.

The urinary tracts were then studied by means of intravenous pyelograms. Diodrast was the material used. The x-ray plates were read by Drs. Howard and Cross of the roentgenologic department. Two patients showed definite changes of the upper urinary tract, such as hydroureter, dilatation of the renal pelvis, and blunting of the calices. There were no x-ray evidences of complete

AVITAMINOSIS A

Incidence in a Group of One Hundred Hospitalized Children as Measured by the Biophotometer

HOWARD G. RAPAPORT, M D , and DOROTHY GREENBERG, B A , New York City

IT IS generally accepted that inability to accommodate the eyes rapidly to the glare of lights at night is a manifestation of vitamin A deficiency. Night blindness and its association with avitaminosis A was even known to some observers in ancient times. It was Hippocrates who suggested the addition of liver to the diet for its treatment.

In 1934 Jeans and Zentmire¹ employing a Burch-Hirshfeld instrument were the first to describe a practical method for the determination of vitamin A deficiency. They tested 213 children who were hospitalized for various causes. Of this group of children 21.5 per cent showed subnormal tests indicative of avitaminosis A. In 1937 an instrument known as the biophotometer² was perfected and used for testing a group of school children in whom 19 per cent were found to give subnormal and 5 per cent borderline readings. The detection of vitamin A deficiency by means of this instrument was confirmed by Jeghers,³ Park,⁴ Corlette *et al.*,⁵ Vanzant,⁶ Maitra and Harris,⁷ Schuck and Miller,⁸ and others.

The principle underlying the use of the biophotometer is based on the following theoretic considerations.⁹ Normal vision is dependent on the presence in the retina of an adequate supply of visual purple, considered to be identical to vitamin A. When the eye is exposed for a few minutes to bright light, some of the visual purple is destroyed by bleaching. In consequence, the acuity of vision as measured by the ability to see a dimly illuminated object in the dark is lessened. This acuity of vision is further depressed in persons deficient in vitamin A. The extent that sight returns to normal depends on the amount of visual purple that can be regenerated, a conversion directly governed by the available supply of vitamin A. Schematically, the reactions are as shown at the bottom of the right-hand column.

This paper comprises a study of the incidence of vitamin A deficiency as measured by the biophotometer on a group of 100 afebrile children, ranging in age from 6 to

13, from the pediatric wards of Mount Sinai Hospital. They had various illnesses.

Results

Sixty children or 60 per cent of this group tested were found to possess normal visual acuity; another 11 children or 11 per cent gave borderline readings. The remaining 29 children or 29 per cent of this series were found to have marked deficiency in their visual acuity.

Maitra and Harris⁷ reported that among 200 elementary school children 22 to 26 per cent were definitely subnormal. They found vitamin A deficiency to be more prevalent among younger children than among adolescents. Their results were consistent with repeated tests. Park,¹⁰ in a study covering persons of all ages, maintains that the biophotometer affords an accurate means to determine by test the vitamin A content of the body, and he found a "large percentage" to be low in vitamin A. Further, Gridgeman and Wilkinson¹¹ stated that 30 per cent of their series of persons of all ages demonstrated vitamin A deficiency, while Jeghers³ reported an incidence of 35 per cent of a group of 168 medical students.

The incidence of avitaminosis A as found in this study is greater than any previously reported. This may be due to the fact that a number of the children tested came from homes of the lower economic strata. Such children may have been just barely within the range of normal vitamin A limits prior to the illness that necessitated hospitalization. Moreover, Clausen and McCord¹² demonstrated that infection causes a prompt and considerable decrease in the concentration of carotene, xanthophyll, and vitamin A in the blood plasma.

Vitamin A + protein (visual yellow) \longleftrightarrow Retinene + protein (visual yellow)

Discussion

Dr Arthur J Murphy, *New York City*—This interesting and valuable study of Dr Wallingford's includes several important facts. It emphasizes the frequency of urinary symptoms in gynecologic patients. Of 100 routine panhysterectomies, there were 24 patients who complained of preoperative frequency, dysuria, and nocturia. It is a serious omission to overlook urinary symptoms because there is more evident pathology in the pelvis, and, in my opinion, if they are accompanied by positive urinary findings, cystoscopic study is indicated. Occasionally, important pathology in the urinary tract will be discovered which will require treatment before panhysterectomy or other variations, such as anomalies or displacements of the bladder or ureters, may be detected and thereby aid in preventing injury during operation. In a recent case a large ovarian cyst was removed from a patient who developed an acute postoperative bilateral pyelonephritis. Cystoscopic study demonstrated a large calculus in the left ureter and a huge branching calculus in the right kidney. It was a serious matter to have disregarded the urinary symptoms and to have operated on this patient without knowing the condition of her urinary tract. As a result she developed a grave renal infection that required prolonged treatment before the urinary calculi could be removed.

The diagnosis of serious injuries of the bladder or ureters is usually manifested by the appearance of a urinary fistula. Fortunately, in the hands of the surgeon who has had a large experience in total hysterectomy such injuries to the urinary tract will be infrequent. Nonetheless, when they do occur they are of great importance because several operations are often required for their repair, a kidney may have to be sacrificed, or they may even prove fatal.

On the other hand, minor lesions of the urinary tract often pass undiagnosed. Dr Wallingford

states that undiagnosed lesions of the urinary tract do occur. In his routine postoperative study of 100 panhysterectomies he found definite pathology in the urinary tract in 2 cases. This study is important, therefore, because it proves the existence of unsuspected injuries to the urinary tract during panhysterectomy. These injuries may not have great immediate importance, but, because they are undiagnosed and therefore untreated, they may result in more serious pathology in the future, and they probably account for some of our postoperative urinary infections.

The frequency of these infections following panhysterectomy cannot be determined from the study of only 100 cases. It is not the purpose of this discussion to appraise the merits of total or subtotal hysterectomy, but it is probably true that the percentage of undiagnosed injuries would be greater following total hysterectomy.

This study is a forward step in estimating the results of panhysterectomy and its influence on the urinary tract. Because of the small number of cases examined and because intravenous urography frequently fails to delineate accurately the entire urinary tract, exact conclusions cannot be determined from this study. Precise results, however, should be obtained by preoperative and postoperative cystoscopic studies in a larger series of cases.

I enjoyed hearing Dr Wallingford's excellent paper and I appreciate the opportunity of discussing it. I hope that we will have the opportunity of hearing further from Dr Wallingford on this important subject.

Dr E von Graff, *New York City*—I do not intend to go into an argument as to the advantages of panhysterectomy. The excellent results of the Sampson school are certainly gratifying to me as an insistent advocate of total versus subtotal hysterectomy. With proper technic, injuries to the ureters are rare and can be satisfactorily repaired if discovered during operation. Injuries recognized only a week or more after operation are a different problem and may require nephrectomy unless the kidney function has been destroyed either spontaneously or by x-ray. The cases in which function can be restored by surgery are few, and I should like to report such a case. A woman was admitted to my department in Iowa City with bilateral ureter fistula following panhysterectomy performed elsewhere for cancer of the cervix. The right ureter was successfully implanted seven months after the original operation. Four months later, a "hair fistula" of the left ureter having been discovered, the second ureter was successfully implanted into the bladder according to the technic of Sampson.

The patient has no more right to all the truth than he has to all the medicine in your saddle-

bag
him

He should get only so much as is good for
—Oliver Wendell Holmes

TUMORS OF ISLETS OF LANGERHANS WITH HYPERINSULINISM

VIRGINIA KNIFFLAND FRANTZ, M D , New York City

IN THE past six years a number of patients have been explored at the Presbyterian Hospital because of hypoglycemia. The first operation was done in January 1934. The first 6 cases, together with a review of the literature, were reported by Whipple and Frantz,¹ and an article by Frantz² deals with the possible malignancy of some of the tumors removed from later cases.

The tumors, although more frequently recognized clinically than in former years, are not common, and the great majority of published cases even those with full pathologic reports, have appeared in clinical journals. It would seem, therefore, appropriate to present the gross and microscopic findings, since, except in hospitals where there is known to be a particular clinical interest in the subject, no great number of these tumors has reached any single laboratory.

A review of 20 published islet cell tumors, together with 4 of his own, was published by Warren³ in 1926. In none of these were symptoms of hypoglycemia noted. In the following year the first case of such a tumor with hyperinsulinism was published by Wilder.⁴ This was a carcinoma of cells closely resembling islet cells, with metastases to liver, regional nodes, and mesentery. The patient had a blood sugar as low as 45 mg. per hundred cubic centimeters and suffered from attacks of unconsciousness. Exploratory operation confirmed the preoperative diagnosis, and autopsy a month later yielded metastatic nodules from the liver which were extracted by Best's method. The extract acted like insulin when injected into rabbits.

The first surgical cure was effected by Roscoe Graham. The patient had an islet cell tumor which was excised. This case was published by Howland and his co-workers⁵ in 1929, and in the fall of 1939 a ten-year follow-up¹ was reported on this patient who has remained symptom-free.

Since 1929, case reports have appeared with increasing frequency. Only a few tumors have been reported in which no symptoms of hypoglycemia were present. In 1935 in our own review of the literature, there were 31

cases of tumor with hyperinsulinism, including our own, and 31 cases with no recorded hyperinsulinism, an equal number. Since then the reports of functional cases have continued, but few reports have appeared of non-functional tumors. These are usually incidental findings at autopsy, and it is difficult to know the actual frequency. It is of interest that, morphologically, with the ordinary stains, the functional and nonfunctional tumors cannot be distinguished. Whether the specific granule stains will ever become sufficiently reliable to make the differentiation is a matter of speculation. The difficulty of obtaining autopsy material fresh enough for these techniques is well known. At present, therefore, the pathologist can make a diagnosis of islet cell tumor, benign or malignant, but is not in a position to qualify this with any statement about function.

In reviewing the literature up to January 1, 1940, and including our own cases, we found a total of 96 cases of islet cell tumor with hypoglycemia. We have had personal communications concerning a number of other cases and have had the opportunity of seeing a number of specimens, but we have analyzed only the published cases. These fall into three groups, as shown in Table 1.

TABLE 1—ISLET CELL TUMORS WITH HYPOGLYCEMIA

	Total
Tumors removed at operation and considered benign	46
Tumors found at autopsy and considered benign	24
Total benign tumors	70
Tumors removed at operation and suspected malignant	19
Tumors found at autopsy and suspected malignant	2
Total suspicious tumors	21
Carcinoma with metastases proved malignant	
Total islet cell tumors	96

Note. These figures represent individual cases and do not include the multiple tumors of each case.

The tumors, excluding the obviously infiltrating growths, are somewhat variable in appearance. Grossly, they are small, usually about 1.5 cm. in diameter, and they occur most frequently in the tail of the pancreas where the islets are most numerous. But they may be found anywhere in the gland. They appear encapsulated, and at operation *in situ* they have a reddish or purplish hue.

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 8, 1940.

From the Surgical Pathology Laboratory of the College of Physicians and Surgeons, Columbia University, and the Department of Surgery of the Presbyterian Hospital.

A serious criticism directed against the use of the biophotometer for determination of vitamin A deficiency has been that when tests were repeated on the same subjects, on successive occasions, different and improved results were frequently observed. This has been called the factor of learning. We believe this factor has been unduly stressed. In a study of a group of children with cutaneous manifestations of vitamin A deficiency by Dr Lehman and one of us (H G R),¹³ it was found necessary to subject these children to biophotometric tests several times prior to the advent of therapy. Furthermore, we found that when the test was thoroughly explained to the child and a trial period was permitted before the actual performance of a complete test, all tests were in approximate agreement. We believe, also, if one appreciates that the biophotometer is an instrument that affords qualitative rather than quantitative readings, then the interpretation of such results will not be difficult.

In an analysis of the children in this study from the point of view as to whether vitamin A deficiency is more closely associated with acute rather than chronic illness, our impression is that it is more frequently associated with chronic disease, which is to be expected.

Summary

A group of 100 hospitalized afebrile children were tested with the biophotometer, an instrument employed to determine the vitamin A content in the body. Sixty per cent of the children were found to give a normal test to vitamin A, 11 per cent were "borderline," and 29 per cent of the children showed a definite deficiency in vitamin A.

RELIEF FOR A MEDICAL HEADACHE

Negotiations that have been in a rather nebulous state for several years and have become a practical issue for some months have culminated in a most constructive economic advance for the physicians of Michigan, reports the *Journal of the Michigan State Medical Society*.

Mr William J. Burns, executive secretary of the society, made the initial contacts, and a committee of the council with Mr Burns has finally secured a voluntary agreement with the representatives of the insurance companies active in Michigan which should be most welcome to every practitioner. It should definitely be realized that the fullest cooperation was forthcoming from the representatives of the associations of insurance companies both from the "old line," and the "mutual" companies as well as the "independent" companies of Michigan. Their enthusiastic aid was most acceptable and appreciated.

One of the headaches of the practice of medicine has been the fact that the attending physician to an automobile accident victim has too frequently been unable to collect for his services. The same situation also has been a vital problem for hospital management. Now there will be some relief from an unpleasant situation.

The gist of the agreement is that the patient who has been injured in an automobile accident and for whom an insurance company is to be

financially responsible will sign an agreement giving the insurance company the right to make separate checks covering charges for services to the hospital and physician. There should be but little difficulty in getting this assignment from the patient while the memory of the service rendered is still fresh in his mind. The one agreement will cover both the hospital and the physician. The insurance companies have promised to assist the physicians in every possible way in getting these signatures and in the subsequent legal procedures.

Of course, there are a great many of these accident cases (not covered by any insurance) that must still be cared for as charity, but at least the physician will know that if an insurance company is liable for the care of his patient, the money for his services probably will not be used by the "grateful" patient to buy a new car or a fur coat instead of paying the bills for services that saved him from pain, suffering, or death.

In Wisconsin a similar agreement has been in existence for two years. In Massachusetts there is a separate agreement for the physicians and for the hospitals.

If this works out as satisfactorily in Michigan as it has in Wisconsin and Massachusetts, physicians of Michigan, as did the council, may well applaud the work of this committee that completed this welcome agreement.

Discussion

Dr Maurice N Richter, *New York City*—Dr Frantz has called our attention to certain peculiarities of a tumor with which few of us have had much experience. Tumors of the islets of Langerhans are uncommon, and we are fortunate in having Dr Frantz's experience with such a large series.

It is apparent that these tumors belong to a group characterized by a tendency to invade blood vessels. As vascular invasion is a feature commonly associated with malignancy, it is surprising to find that clinical evidence of malig-

nancy is not found more frequently. The significance of vascular invasion in these tumors must be re-evaluated. This can be done best by statistical analysis for which adequate records, including the presence or absence of vascular invasion, are essential.

I agree with Dr Frantz on the difficulty of staining specific granules in the islet cells. This is not easy in the normal pancreas and is much more difficult in islet tumors. Even if the granules are stained, their significance in tumors cannot be determined until more is known about them in normal islets.

"THE JARGON MAY GET US IF WE DON'T WATCH OUT"

Nearly everyone knows the predicament of the man who caught the bear by the tail—there was serious uncertainty as to whether he had the bear or the bear had him. A somewhat similar problem is presented in the terminology employed in a number of the sciences and near sciences related to public health, remarks the *American Journal of Public Health*. Thus, some years ago the helminthologists took a tail-grip on "worm burden," and for a while one wondered if the patient had the burden, or the worms had the patient, or if possibly the worm burden had the helminthologists. Their use of this phrase, however, does not constitute a major semantic sin; they were tempted by the blandishments of a catch phrase and they fell, but helminthologists are, after all, pretty robust scientists and we need not worry much about them.

A more serious situation is created by the etymologic expeditions of the hardy prospectors who find themselves in the swamps and forests surrounding the established settlements of public health. From the enthusiasm of these pioneers one gains an impression that they have discovered a promised land, and this may be true. Unfortunately, however, they seem to have decided that as a matter of strategy they must establish vocabulary frontiers and diction block-houses so remote from settled language usage that savages from the hinterland of lay affairs and the effete plodders of conventional public health work may never hope to invade the new domain.

Recently we picked up a paper from one of these Shangri-Las of public health. The opening sentence gave promise that the essayist would get right down to cases and make a forthright and understandable statement. Soon,

however, that author grabbed the word "technic" by the tail and from then on it was anybody's fight. For our own part, we were conscious of the same urge to kill that arises when one's hostess fails to restrain her child from demanding too much attention for his new parlor trick. On further reading of the paper, however, this irritation gave place to amazement, for nouns began to take on the functions of verbs and then "learning processes," "skills," "attitudes," "situations," "levels," and "challenges" began to "motivate," "implement," "integrate," "coordinate," and "enrich" "patterns" of "culture" and "philosophy"—or vice versa.

We put that paper down with a feeling that we were losing our grip, that we had failed to keep up with the newer things, that the old and heretofore secret feeling of inadequacy was coming shamefully to light. We felt that without quibbling we must make a decision as to whether we understood this thing or not. Finally, and reluctantly, we admitted that we didn't know what the deuce the author was driving at. This admission gave rise to a new courage, and we wondered if perhaps in the tussle between the bear and the author the outcome was not a victory for the bear.

There is, of course, a place for technical terms, and in writing or speaking it is desirable to choose expressions that give just the shade of meaning one wishes to convey. But this nicety of selection is quite a different thing from the too heavy burdens and the too long hours of work that some impose upon defenseless words and phrases. Maybe we need word-burden legislation or a Society for the Prevention of Cruelty to Phrases. Otherwise, the jargon is going to get us if we don't watch out.

CONFERENCE—SARATOGA SPRINGS

The Annual Conference of Health Officers and Public Health Nurses will be held at Saratoga Springs, June 24 to 26, inclusive. The Grand Union Hotel will be headquarters. The seventh annual meeting of the New York State Association of School Physicians will be held Monday, June 23, at the same place.

TAKE MORE INTEREST, TOO

"By the way," said a lawyer in drawing up a will, "I notice you have mentioned six bankers as pall bearers. Wouldn't you rather choose some friends with whom you are on better terms?"

"No, that's all right," was the quick reply. "Those fellows have carried me so long they might as well finish the job."—*Ill. Med J.*

After removal they sometimes appear pinkish yellow, in contrast to the yellower surrounding pancreas, and are of slightly firmer consistency. A number of the tumors show central fibrosis, even calcification, and these may be quite firm. They are not infrequently multiple.

Microscopically, the most highly differentiated tumors closely resemble gigantic islands. A goodly proportion (Table 2) show complete encapsulation. The cells closely resemble cells of normal islets, but the differential granule stains so far reported are quite variable. In our hands, these stains have not been highly successful, and one wonders also if there may not be a variability in the proportion of cells containing alpha and beta granules, depending on the physiologic state of the tissue at the time of removal.

Some of the tumors show quite striking rosette formation about central capillaries. Others show a ribbon-like arrangement of cell cords. Others have a more medullary arrangement. Ducts are frequently present, and this is in accord with the general belief that islet cells can be derived from differentiated duct epithelium. Many of the tumors show degenerative changes and fibrosis, which is central, the better preserved tumor cells lying at the periphery.

Our first 8 tumors removed from 6 patients conformed to this pattern, 3 being incompletely encapsulated microscopically. We have now had a total of 17 patients explored for hypoglycemia. Two of these showed no tumor. Three cases of the 15 with tumor had 2 tumors, a total of 18 tumors for study. In the ninth case, which was a tumor with ribbon-like arrangement, we were surprised to find a somewhat more cellular variation than we had noted previously and clumps of tumor cells in the blood vessels. This tumor

was not encapsulated. Unfortunately, the patient died of pneumonia postoperatively, and no autopsy was obtained.

We have since had 3 other tumors in which there was lack of encapsulation, and tumor cells were found in vessels. One of these was less differentiated than any other tumor in our series, and we felt that it should be classified as a carcinoma. Its characteristics in tissue culture tended to confirm this. This patient is free from evidence of disease thirty-five months after operation. The other 2 more recent cases are also symptom-free. We have wondered if these tumors could be regarded as analogs of the so-called "adenoma malignum" type of carcinoma of the thyroid, which is slow growing and late to metastasize. Metastases or local recurrences of these tumors should signal their presence by a return of hypoglycemia. This has not occurred in our cases nor in any which we have been able to find in the literature. But other authors have also been in doubt as to the significance of these criteria of malignancy. We have divided the 96 cases into those that were considered benign, those that we, and other authors, thought possibly malignant, and those that were of proved malignancy. The analysis is shown in Table 2.

It will be noted that the proportion of questionable cases to benign cases is high—21 to 70. It is of interest that the first case with tumor surgically removed—whose ten-year follow-up I have already commented on—was considered when first examined to have some features of malignancy. Possibly all 21 were malignant, and surgery, in the course of which 19 of these were found, has been unusually happy in its result. Possibly a longer follow-up will demonstrate recurrence or metastasis. We have urged* that these cases should not be lost. Only the follow-up can afford the pathologist a basis for accurate diagnosis on these borderline lesions.*

*To emphasize the difficulties in this study, we have recently had a case of carcinoma of the head of the pancreas, necessitating a large resection, which microscopically shows typical islet cell structure. Yet this patient had no symptoms of hypoglycemia.

legs and severe low back pain. She gave a history of amenorrhea of approximately seven months' duration. During the course of her illness, small purple striae had appeared in the abdominal wall, and a manifest tendency toward purpuric hemorrhages in the skin had been noticed. She had observed increased fat deposits in the face and trunk, while, in contrast, her extremities had become thinner.

Physical examination disclosed a well-developed and well-nourished woman, whose abdomen, neck, and face were obese, but whose extremities were thin. The blood pressure was 170/120. There were numerous ecchymoses over the legs. There was a slight hypertrophy of the face and neck. The clitoris was enlarged. X-rays revealed marked decalcification of all the bones. The blood calcium was 10.6 mg per hundred cubic centimeters, the blood phosphorus, 3.7 mg per hundred cubic centimeters. Perirenal air insufflation showed an enlarged adrenal on the left side.

The patient was operated upon, and a golf-ball-sized tumor was removed from the left adrenal. This proved to be an adrenal cortex adenoma. She was given postoperative supportive measures including cortin. Postoperatively, she went into shock, her blood pressure dropping to 90 mm mercury systolic. She had repeated episodes of temperature rise, dyspnea, and cyanosis, her course was gradually downhill, and she died three weeks after operation.

At autopsy, the operative site in the left lumbar region showed the presence of a chronically infected granulomatous mass. Only small remnants of adrenal tissue were found on this side. The right adrenal gland was small and flat. On section, the cortex was distinctly narrowed.

Microscopic examination of the right adrenal showed a cortical atrophy involving all zones, but particularly the zona glomerulosa. Bronchopneumonia was present in both lower lobes of the lungs. The pituitary showed the hyaline changes in the basophil cells, to which attention has been called by Crooke.²

Case 3—A woman, aged 37, was admitted to the hospital with a history of onset of amenorrhea seventeen months before admission. Coincidentally, a papulopustular rash appeared on the face, arms, forearms, chest, and back, followed by the appearance of hair on the face and abdomen and by an increased growth of hair on the arms and legs. She gained over 30 pounds in a year, the added fat being distributed mostly on the trunk, thighs, buttocks, and breasts. Her voice became deeper and masculine in quality. About five months before admission her blood pressure was found to be 250 mm mercury systolic. From this time on there was a gradual appearance of symptoms of diminished cardiorespiratory reserve, and ankle edema was noted.

Physical examination on admission revealed a well-developed obese woman with ruddy face

and hands. The extremities and face were dusky-sun-tanned. The obesity involved the face, neck, trunk, and proximal portions of the extremities. Ecchymoses were present on the sides of the abdomen and thighs. Pubic hair of normal distribution was present. The skin was flushed, warm, oily, sweaty, and rough. The clitoris was hypertrophied. There was a profuse acneiform eruption of the face, trunk, neck, and proximal portions of the extremities. The hair of the head was sparse and coarse, and there was a fine hairiness of the face, chest, extremities, and abdomen.

An x-ray of the chest showed diffuse nodular shadows suggestive of metastatic malignancy. A large mass was seen above the displaced right kidney in the flat plate taken of the abdomen. The blood calcium was 10 mg per hundred cubic centimeters, the phosphorus, 4 mg per hundred cubic centimeters. The patient ran a progressively downhill course, dying in cardiac failure twenty-three days after admission to hospital.

At autopsy, the right adrenal was found to be replaced by an encapsulated ovoid tumor measuring 14 by 10 by 5 cm. The adrenal was filled with tumor thrombus that extended into the vena cava inferior. On section, the surface of the tumor was a mottled yellow to yellow-pink in color. Metastases were present in the liver and were extremely abundant in the lungs.

Microscopic examination of the adrenal tumor showed many areas of necrosis. The intact portions were cellular, the morphology of the cells varying. Some areas consisted of cells arranged in trabeculae and sheets, these cells being small and their nuclei small and dark staining. In addition, many areas were composed of irregularly shaped, frequently multinucleated, giant cells of varying size and density of their nuclei. The metastases were more regular in their appearance, and their cells resembled the adrenal cortex more closely.

In contrast to this huge tumor mass, the left adrenal was small and weighed 3.2 Gm. The sectioned surface of the cortex was distinctly narrowed. Microscopic examination showed a general narrowing of all zones, as well as areas in which the zona glomerulosa was absent and the zona reticularis atrophic. In addition, there were scattered groups of cells with irregular hyperchromatic nuclei, which were suggestive of early adenoma formation, and a single large fibrous scar in the zona reticularis. The pituitary in this case also showed the hyaline changes in the basophil cells as described by Crooke.²

Discussion

As has been mentioned in all 3 cases, the contralateral adrenal was atrophic. In the first case, even the adrenal from which the adenoma was removed showed a cortical atrophy. A fairly thorough search of the liter-

CONTRALATERAL ADRENAL ATROPHY ASSOCIATED WITH CORTICAL ADRENAL NEOPLASMS

TOBIAS WEINBERG, M D , Baltimore

THE operative attack upon the adrenals in past years, particularly when an obvious tumor was present, has been accompanied in a majority of instances by a lethal outcome shortly following the operation. These patients were observed to go into profound shock, from which, despite the usual therapeutic attempts, such as blood transfusions and intravenously administered saline, they did not rally, death ensuing within twenty-four to forty-eight hours. The almost constant failure of these patients to rally was perplexing. Even after suspicion was directed to the remaining adrenal, the problem presented itself—what therapy should be instituted. Following Swingle and Pfiffner's¹ success in maintaining adrenalectomized dogs in a normal physiologic state by the administration of an adrenal cortex extract, similar therapeutics was instituted in those cases requiring surgical removal of part or all of an adrenal gland. However, this mode of therapy has not proved so simple as it may appear at the first glance. Only with the recently acquired, more thorough knowledge of the various chemical constituents of the adrenal cortex has the haze begun to clear and a truly scientific approach to therapy been instituted.

For a number of years attention has been called to the probably inadequate physiologic function of the cortex of the presumably normal contralateral adrenal gland. Not infrequently, atrophy of varying degree has been observed at postmortem examination as well as at the operating table. The purpose of this report is to re-emphasize the frequent occurrence of such contralateral adrenal atrophy in association with a cortical adrenal neoplasm. Only comparatively recently has stress been placed upon this observation and its serious clinical significance realized, namely, the dire consequences imminent upon operative interference when such a condition existed. That such sequelae are not unusual, or, I should say, rather the rule, is borne out by many cases reported in the literature as well as by 2 of the 3 cases reported here (all examples of the so-called Cushing syndrome).

Read by invitation at the Annual Meeting of the Medical Society of the State of New York, New York City, May 8, 1940

From the Mount Sinai Hospital, New York City

Case Reports

Case 1—An Italian housewife, aged 34, first noticed three years before her death an increasing obesity that began about the hips and then spread upward involving the shoulder girdle and the face. Her friends remarked about the change in her facial expression, and coincidentally there appeared polydipsia and polyuria. One year before admission she was told that her blood pressure was elevated. The menses, which had been regular, ceased four months before admission. Sugar was detected in the urine on several occasions in the month before entering the hospital.

Physical examination on admission revealed a moderately obese woman with a protuberant abdomen and many purplish striae over the lower part of the abdomen and upper part of the thighs, the so-called buffalo facies, and hirsuties prominent on the upper lip and chin. The blood pressure was 170 mm of mercury systolic and 105 mm diastolic. A photograph taken before the onset of her illness when compared with one taken on admission showed that a remarkable transformation had taken place. X-rays showed marked decalcification of the entire skeleton. The calcium concentration in the blood was 9.7 mg per hundred cubic centimeters, the phosphorus concentration was 3 mg per hundred cubic centimeters. By perirenal air insufflation a plum-sized mass was outlined in the region of the right adrenal gland.

Operative interference was decided upon, and at operation both adrenals were exposed. A small atrophic adrenal was encountered on the left. On the right side a walnut-sized mass was enucleated from the right adrenal. It was found to be an adenoma of the cortex. Despite supportive therapy, which included eschatin, the patient went into deep shock the same night and died the next morning.

At autopsy, the right adrenal gland, the site of the resected adenoma, contained a hematoma in its lateral half and was grossly atrophic in appearance. The left adrenal was distinctly atrophic, weighing only 4.7 Gm with the perirenal fat. It was of average length but only about one-fifth the usual thickness.

Microscopic examination of both the right and left adrenals showed a striking narrowing of the cortex with an obliteration of distinct zones. The glomerulose layer was almost completely absent, the zona fasciculata and zona reticularis were poorly differentiated, and both showed the presence of considerable atrophy.

Case 2—A woman, aged 30, was admitted to the hospital complaining of weakness of both

legs and severe low back pain. She gave a history of amenorrhea of approximately seven months' duration. During the course of her illness, small purple striae had appeared in the abdominal wall, and a manifest tendency toward purpura hemorrhages in the skin had been noticed. She had observed increased fat deposits in the face and trunk, while, in contrast, her extremities had become thinner.

Physical examination disclosed a well-developed and well-nourished woman, whose abdomen, neck, and face were obese, but whose extremities were thin. The blood pressure was 170/120. There were numerous ecchymoses over the legs. There was a slight hirsuties of the face and neck. The clitoris was enlarged. X-rays revealed marked decalcification of all the bones. The blood calcium was 10.6 mg per hundred cubic centimeters, the blood phosphorus, 3.7 mg per hundred cubic centimeters. Perrenal air insufflation showed an enlarged adrenal on the left side.

The patient was operated upon, and a golf-ball-sized tumor was removed from the left adrenal. This proved to be an adrenal cortex adenoma. She was given postoperative supportive measures including cortin. Postoperatively, she went into shock, her blood pressure dropping to 90 mm. mercury systolic. She had repeated episodes of temperature rise, dyspnea, and cyanosis, her course was gradually downhill, and she died three weeks after operation.

At autopsy, the operative site in the left lumbar region showed the presence of a chronically infected granulomatous mass. Only small remnants of adrenal tissue were found on this side. The right adrenal gland was small and flat. On section, the cortex was distinctly narrowed.

Microscopic examination of the right adrenal showed a cortical atrophy involving all zones, but particularly the zona glomerulosa. Bronchopneumonia was present in both lower lobes of the lungs. The pituitary showed the hyaline changes in the basophil cells, to which attention has been called by Crooke.²

Case 3—A woman, aged 37, was admitted to the hospital with a history of onset of amenorrhea seventeen months before admission. Coincidentally, a papulopustular rash appeared on the face, arms, forearms, chest, and back, followed by the appearance of hair on the face and abdomen and by an increased growth of hair on the arms and legs. She gained over 30 pounds in a year, the added fat being distributed mostly on the trunk, thighs, buttocks, and breasts. Her voice became deeper and masculine in quality. About five months before admission her blood pressure was found to be 250 mm. mercury systolic. From this time on there was a gradual appearance of symptoms of diminished cardiorespiratory reserve, and ankle edema was noted.

Physical examination on admission revealed a well-developed obese woman with ruddy face

and hands. The extremities and face were deeply sun-tanned. The obesity involved the face, neck, trunk, and proximal portions of the extremities. Ecchymoses were present on the sides of the abdomen and thighs. Pubic hair of male distribution was present. The skin was flushed, warm, oily, sweaty, and rough. The clitoris was hypertrophied. There was a profuse acneiform eruption of the face, trunk, neck, and proximal portions of the extremities. The hair of the head was sparse and coarse, and there was a fine hirsuties of the face, chest, extremities, and abdomen.

An x-ray of the chest showed diffuse nodular shadows suggestive of metastatic malignancy. A large mass was seen above the displaced right kidney in the flat plate taken of the abdomen. The blood calcium was 10 mg per hundred cubic centimeters, the phosphorus, 4 mg per hundred cubic centimeters. The patient ran a progressively downhill course, dying in cardiac failure twenty-three days after admission to the hospital.

At autopsy, the right adrenal was found to be replaced by an encapsulated ovoid tumor mass measuring 14 by 10 by 5 cm. The adrenal vein was filled with tumor thrombus that extended into the vena cava inferior. On section, the cut surface of the tumor was a mottled yellow and yellow-pink in color. Metastases were present in the liver and were extremely abundant in the lungs.

Microscopic examination of the adrenal tumor showed many areas of necrosis. The intact portions were cellular, the morphology of the cells varying. Some areas consisted of cells arranged in trabeculae and sheets, these cells being small and their nuclei small and dark staining. In addition, many areas were composed of irregularly shaped, frequently multinucleated, giant cells of varying size and density of their nuclei. The metastases were more regular in their appearance, and their cells resembled the adrenal cortex more closely.

In contrast to this huge tumor mass, the left adrenal was small and weighed 3.2 Gm. The sectioned surface of the cortex was distinctly narrowed. Microscopic examination showed a general narrowing of all zones, as well as areas in which the zona glomerulosa was absent and the zona reticularis atrophic. In addition, there were scattered groups of cells with irregular hyperchromatic nuclei, which were suggestive of early adenoma formation, and a single large fibrous scar in the zona reticularis. The pituitary in this case also showed the hyaline changes in the basophil cells as described by Crooke.

Discussion

As has been mentioned in all 3 cases, the contralateral adrenal was atrophic. In the first case, even the adrenal from which the adenoma was removed showed a cortical atrophy. A fairly thorough search of the litera-

ture of the past fourteen years yielded 34 cases of adrenal cortical neoplasm in which the clinical observations upon the state of both adrenals were confirmed by autopsy. Seven (20.6 per cent) of these were adenomas, 27 (79.4 per cent) were carcinomas. Atrophy of the contralateral adrenal was encountered in 21 cases (61.7 per cent). The contralateral adrenal was absent in 2 cases. It is not unlikely that in these cases atrophy may have been so great that only after a diligent search could they have been found. In 1 case, as in the first presented here, there was bilateral adrenal atrophy, but in the case cited it was associated with a tumor of an accessory adrenal. The contralateral adrenal was recorded as "grossly normal" in 10 cases. In practically every one of these cases there was no report of microscopic confirmation of the gross observation. It is evident from the above figures that a majority of the cases of cortical adrenal neoplasm are associated with atrophy of the contralateral adrenal.

To explain the atrophy of the adrenal in these cases, the following hypothesis, which has been championed particularly by Walters and Kepler,³ Cahill and Loeb,⁴ and also Goldzieher,⁵ seems a plausible one. It seems both possible as well as probable that the excessive secretion of adrenal cortical hormones by the actively growing tumor suppresses the function of the contralateral adrenal so that atrophy eventually ensues. Experimentally, this view is supported by the work of Ingle and Kendall,⁶ who succeeded in producing atrophy of the adrenal cortex in rats by injection of massive doses of cortin. Wells and Kendall,⁷ more recently demonstrated that, of all the separable fractions so far obtainable from the

adrenal cortex, only corticosterone was capable of producing a significant degree of such atrophy.

Analogous observations have been made by others upon the effects of parathyroid adenomas, thyroid adenomas, and pancreatic islet adenomas,⁸ in which instances, removal of the functioning adenoma has precipitated a temporary insufficiency in secretion of the related gland.

Conclusion

If cognizance were taken by the surgeon of the frequency of adrenal atrophy in association with these neoplasms, the high mortality rate attendant upon operative interference might be considerably lowered, particularly if appropriate preoperative therapy (possibly in the form of desoxycorticosterone acetate and cortin as well as saline⁹) is instituted and also if these patients are not observed for too long a period after the onset of symptoms before operation is undertaken so that functional inactivation of the contralateral adrenal, if not actual atrophy, might be avoided.

LOGIC THAT LIMPS

Westchester physicians warn against an effort by compulsory health insurance proponents to promote their "nostrum" under the guise of a national defense measure.

An editorial in the *Westchester Medical Bulletin*, published by the county society, asserts that compulsory health insurance is being urged on the claim that "the examination of draftees has resulted in a large number of rejections for physical defects, that the health of the people generally is bad, that the health of the industrial population, upon which defense industry depends is especially bad, that health is necessary for defense, and that, therefore, we must have compulsory health insurance."

"The only thing the matter with this proposition is that the first three premises are completely untenable and the conclusion is absolutely unrelated to the premises," the editorial says.

It points out that the percentage of rejections of draftees is not high, relatively speaking, despite the fact that acceptance standards are considerably higher than in 1917, and that the vast bulk of the rejections are for defects of teeth, eyes, feet, or general nutrition which would not be affected by compulsory health insurance.

Statistics issued by the Metropolitan Life Insurance Company in January, 1941, are cited to show that death rates in the industrial population have improved faster than those of the population as a whole and that the industrial worker now enjoys as long a life as the average citizen.

The editorial inquires "Why is it necessary to attempt to justify compulsory health insurance upon such an irrelevant bogus proposition as this?" The answer given is "simply because even its most ardent supporters cannot make it stand on its own feet."

Diagnosis

THIS new JOURNAL section carries case reports that have been made the subject of discussion from the point of view of the diagnostic process needed and the post-mortem evidence. All cases are selected because of some unusual interest. Two hospitals in this city supply this material, each six times a year. Reports from the New York Post-Graduate Hospital alternate with reports from Bellevue Hospital, Fourth Medical Division.—*Editor*

CLINICOPATHOLOGICAL CONFERENCES

FOURTH MEDICAL DIVISION OF BELLEVUE HOSPITAL

History

The patient was a 54-year-old white woman who came to Bellevue Hospital by ambulance with a five-day history of fatigue and malaise associated with fever, chills, and sweats. Her physician had given her sulfathiazole without avail. A brother revealed that four weeks before admission she had become ill with chills and transient diarrhea after eating at the World's Fair. Past history revealed a two months' story of exertional dyspnea and recent digitalization by her physician for sub-sternal tightness, ankle edema, and epigastric pain. However, this medication seemed only to aggravate the cough, with expectoration of mucus. Patient denied hemoptysis or rusty sputum at any time.

On admission she appeared acutely ill and slightly cyanotic and was dyspneic and orthopneic. No jaundice was present. Her temperature was 102, pulse, 88, respirations, 28, and blood pressure, 85/50. The pupils were equal and reacted to light and accommodation. Extraocular muscles were intact, and sclerae were clear. There was evidence of coryza. The tongue was moist, and the pharynx was diffusely reddened. Her ears were normal. The trachea was in midline, no glands or enlargement were present in neck. An examination of the spine revealed no vertebral or costovertebral angle tenderness. Breasts were normal, glands were not palpable. Examination of the lungs revealed diminished resonance and diminished bronchovesicular breath sounds over the right base below posterior T₇ and anterior R₅, with medium moist and dry crackling rales, on the left, medium moist and dry rales below posterior T₇ and anterior R₅. Her heart was not enlarged, sounds were of good quality, and there was regular sinus rhythm. A soft blowing systolic was heard throughout. P₂ was greater than A₂. The abdomen was distended and tympanitic but not tender, the liver was felt two finger-breadths below the costal margin. The

spleen was not palpable. Her reflexes were physiologic. The extremities showed no clubbing, but slight peripheral edema was present.

The patient's course of twenty-five days in the hospital was progressively downhill. The temperature was septic throughout, and, at first, she had relative bradycardia. On the second day after admission one observer found a thrombophlebitis of the right saphenous vein posteriorly. At about the same time, icteric sclerae were noted. Although the liver was palpable at that time, it was not tender. The chills during the third and fourth weeks were so severe as to necessitate intravenous morphine sulfate. Her case was treated as pneumonia, with no apparent alteration of course. On the twenty-first hospital day petechiae were observed in the left lower conjunctival fold, and a harsh blowing systolic was heard over the pulmonic area. The laboratory work-up is as noted below. In spite of transfusions, continuous therapy for congestive failure, and removal of 150 cc of serosanguinous fluid from the left chest, the culture of which was sterile, her toxic state became more progressive, and she died on the twenty-fourth hospital day.

The laboratory findings were as follows. Blood nonprotein nitrogen on admission was 36, blood sugar on admission was 98. Blood chlorides was 495.0. Blood Wassermann was negative. Routine urinalyses were negative except for 1 to 2 plus albumin and an occasional red blood cell, the specimen on the day following admission showed positive urobilinogen in 1:160 dilution. The red cell count on admission was 4,200,000 per cubic millimeter, with 90 per cent hemoglobin, falling to 2,040,000 with 56 per cent hemoglobin two days prior to death. The white cell count on admission was 3,800 per cubic millimeter, with 84 per cent polymorphonuclears, the white cell count was repeated the same day and showed 2,350 cells per cubic millimeter, with 76 per cent polymorphonuclears. Subsequent

white cell counts ranged between 7,100 and 12,150 per cubic millimeter. The differential counts were not remarkable. A blood smear taken the day after admission was negative for malarial parasites. During the last week the blood smear showed anisocytosis, slight hypochromia of the red blood cells, and toxic granules in the white blood cells. The icteric index fluctuated between 28 and 20, and the van den Bergh, direct, gave a delayed reaction and, indirect, gave a positive reaction. The blood culture was first reported positive on the seventeenth day of hospitalization, there being present 30 colonies of paratyphoid B group per plate. Two subsequent cultures on the twentieth and twenty-second days revealed 40 and 160 colonies per plate, respectively, of paratyphoid B group. A stool culture was negative for typhoid, paratyphoid, and dysentery groups. The agglutination tests were positive to a trace in 1:1,600 dilution of paratyphoid B group on several occasions. Sputum examinations were negative for pneumococci on two occasions. Roentgenogram taken on admission revealed a pneumonic consolidation over the lower lobe, left side. Subsequent examination twelve days later revealed extensive interstitial changes and fibrosis throughout the lower three-quarters of both lungs. Findings suggested chronic bronchitis and bronchiectasis. Electrocardiogram on the third day revealed PR, interval of 0.18 second, QRS—0.08 second, large P waves in lead II, sinus rhythm with right axis deviation, myocardial changes, and increased auricular activity. Another electrocardiogram two days prior to exitus showed atrioventricular rhythm with right bundle-branch block, occasional ventricular premature contraction, QRS—0.16 second.

Discussion

DR HARRY A. SOLOMON. The predominant clinical features of this case on admission were those of congestive heart failure in an elderly woman who was a known cardiac of long duration. A double mitral murmur was present, and rheumatic heart disease, class 4, was diagnosed. Like so many other cases this patient's heart failure overshadowed other conditions that were found to be present as further observation progressed. Digitals did not relieve the signs of myocardial insufficiency. It was necessary to explain the presence of a severe septic state with high temperature, chills, and fever, marked leukopenia, and jaundice—all of which were present on admission. Signs of consolidation were found in

the lower lobe of the right lung and were confirmed by x-ray examination.

Chemotherapy did not influence the fever or toxic state. In the presence of a pneumonia, leukopenia, and lack of response to sulfonamide therapy, the possibility of an atypical or virus pneumonia was considered. However, because the patient had received sulfonamides before coming to the hospital, the possibility of a leukopenia being due to the drug was mentioned, although the differential count did not suggest the characteristic neutropenia usually produced by the leukoplasmic depression by this drug. The jaundice was considered to be due to toxic hepatitis or possibly pulmonary infarction, especially inasmuch as the lungs in long-standing cases of mitral disease are favorable to the rapid change of hemoglobin into bilirubin.

The possibility of embolic instead of marantic infarction was considered because of the presence of saphenous thrombophlebitis and a hemorrhagic pleural effusion obtained when the chest was aspirated. Because of the severe and prolonged chills which appeared later, the question of liver abscesses opening into the hepatic veins also had to be excluded. Morphine sulfate intravenously used to control the chill and its debilitating effects worked almost instantaneously and most effectively. When the agglutination tests became positive for paratyphoid B and the blood culture was also positive for the same organism, it was possible, of course, to explain the entire picture on the basis of active bacterial endocarditis due to this organism.

Petechiae, increase in the chills and the highspiking temperature, the increasing number of colonies in the successive blood cultures, and the downhill course of the patient, all indicated the progressive character of the severe infection. The possibility that the pneumonic involvement was due to the same organism could not be established either from the sputum or from a culture of the pleural fluid. The question as to whether the pulmonary valve, as well as the mitral valve, was the seat of active bacterial vegetation was considered because of the appearance of a murmur over the pulmonary area and the changing lung signs.

When the history of diarrhea, which was present for one month prior to admission, was subsequently obtained, the sequence of events could be easily correlated. The source of the infection was in the food ingested at the World's Fair, and the portal of entry was, therefore, through the intestinal tract with

subsequent development of bacteremia and, finally, development of bacterial endocarditis due to paratyphoid B

DR. CHARLES H NAMMACK Before the blood culture was reported positive, the striking signs of bradycardia and leukopenia led us away from the diagnosis of bacterial endocarditis. The late Dr Van Horn Norrie stated that bacterial endocarditis was never present in a patient who had a pulse rate below 100.

DR SOLOMON. Hemorrhagic chest fluid raised the question of paratyphoid pneumonia.

DR NAMMACK The first chest plate looks like a pericardial effusion.

DR SOLOMON This was a portable plate and taken before the patient was adequately digitized.

DR MENNASCH KALKSTEIN I understand that the Department of Health recently reported several other cases of paratyphoid B infection, possibly originating from the World's Fair.

DR EMANUEL APPELBAUM It is important to recall that paratyphoid gives rise to two distinct disease entities—(a) acute food poisoning or gastroenteric form, and (b) typhoid form. The former may be of mild nature but, at times, severe and fulminating in character. The latter presents a clinical picture like that of typhoid fever, except of milder degree usually. It should be pointed out that lesions in the small intestine are much less common in paratyphoid fever than in typhoid fever. The importance of paratyphoid carriers must also be borne in mind.

DR LOUIS F BISHOP, JR The terminal aiculoventricular block raises the question of its etiology. In cases of progressive heart failure it is not necessary to assume any organic basis for this. It may be due entirely to ischemia. However, we have recently had a case where the vegetation ulcerated through the interventricular septum giving rise to interventricular block.

Presentation of Pathology

Primary	Acute bacterial endocarditis (paratyphoid B group— <i>Cholera suis</i> , <i>Salmonella supester</i>)
	Rheumatic heart disease

Secondary

Heart	Hypertrophy and dilatation Buttonhole mitral stenosis
Lungs	Chronic passive congestion Acute edema and congestion
Spleen	Chronic passive congestion Infarct
Uterus	Fibromyomas
General	Conjunctival petechiae Icterus Edema of lower extremities

DR DAVID M SPAIN Postmortem examination showed a tight mitral stenosis with a marked calcification. On the auricular surface of the anterior mitral leaflet there was a grayish pink, friable, flat vegetation which partly ulcerated the valve. The vegetation was $\frac{1}{2}$ cm in thickness and $1\frac{1}{2}$ cm in diameter. The spleen showed one infarct. There were no intestinal lesions present, and nothing else was found that might be associated with a paratyphoid B group infection.

Microscopic examination revealed a vascularized, fibrosed, and calcified mitral upon which was superimposed a thrombotic mass of fibrin, polymorphonuclear leukocytes, and lymphocytes.

Postmortem bacteriologic studies revealed pure cultures of paratyphoid B group (*Cholera suis*) from heart blood, bile, and the center of the vegetation.

There have been previous reports of somewhat similar cases in the literature. Kretschmer reported a case in 1935 of paratyphoid B mitral endocarditis without intestinal lesions. H G Wells in 1936 reported another case in which the only additional finding was some grayish pigmentation of Peyer's patches. Longcope in 1905 reported a fatal case of acute paratyphoid B septicemia in which there was neither endocarditis nor intestinal lesions. Most likely the paratyphoid organism entered the body through the intestinal tract during the acute episode of food poisoning. What the pathogenesis was from this point on is open to speculation.

Another interesting finding as a result of sulfadiazine therapy was the presence of numerous, small, yellow, crystalline deposits in the minor calices of the kidney. These crystals were identified as belonging to the sulfadiazine group.

FRACTURE DAY—BUFFALO COMMITTEE, AM COLLEGE OF SURGEONS

The first annual fracture day of the Buffalo Fracture Committee of the American College of Surgeons will be held on May 2—the day following the annual State Society meeting. The program will be devoted to the discussion of fractures and other traumas. It will begin at 9 00 A.M. and will take place in the Children's Hospital Auditorium, 235 Bryant Street, Buffalo. A cocktail hour, followed by dinner, will be held at the Buffalo Club, after which there will be a discussion of the papers presented throughout the day. Dr Robert P. Dobbie is chairman.

NATIONAL GASTROENTEROLOGICAL ASSOCIATION—ANNUAL CONVENTION

The sixth annual convention of the National Gastroenterological Association will be held on May 13, 14, 15, and 16 at the Commodore Hotel in New York City. Members of the medical profession are cordially invited to attend. Dr Henry Kendall, of New York City, is chairman of the scientific program committee. A committee of ladies is arranging an interesting program of social activities for the families and friends of the visiting members. Mrs Anthony Bassler, of New York City, is chairman of this committee.

Medical News

County News

Albany County

Dr Foster Kennedy, of Cornell Medical College, New York City, addressed the county society on March 26 on "Science, Civilization, and Faith." Dr Kennedy discussed the effect upon the scientist of the Nazi rise to power, as well as the duty of the scientist to the people in this international crisis. Discussion was opened by Dr R. S. Cunningham (by invitation).

Dr H. L. K. Shaw, 67, of Albany, who died on March 26, was a prolific writer on child health and disease. Dr Shaw also translated, from the German, Pfaundler and Schlossman's seven-volume *The Diseases of Children*. In 1914 he wrote the first baby book distributed by the State Health Department, *Your Baby—How to Keep It Well*.

Author of other scientific pamphlets, Dr Shaw was an advisory editor and writer for *Parent's Magazine*, editor of the happy child department of *Delinctor* magazine and a frequent contributor to the *New York Herald Tribune*, on whose advisory council he served.

He also was author of *The Happy Child*, 1924, *The Young Child's Health*, 1925, and *Communicable Diseases in Children*, 1927.

Dr Shaw was American delegate to the International Medical Congress at Lisbon, Portugal, in 1906, and at various times was president of the American Pediatric Society, the American Child Hygiene Association, the Central New York Pediatric Club, and the Albany County Medical Society. Former President Hoover succeeded him in the child-hygiene post.

Chautauqua County

Dr William G. Farlow, of Rochester, spoke on the modern treatment of the putrid lung abscess at the meeting of the county society on March 19 at the Hotel Jamestown. Dr Ernest J. Kelley, Jr., presided.

Army authorities have revoked the order calling Dr Robert X. Williams, of Clymer, to active service. Eight hundred persons signed a petition asking that Dr Williams be permitted to stay with his practice, as the nearest doctor was ten miles away, at Panama.

Chemung County

Rheumatic fever and its resulting heart diseases are the great causes of death between the ages of 5 and 15 in New York City, Dr Katherine Dodge, associate professor of pediatrics, Bellevue Medical School, New York City, told the county society on March 12 at the Mark Twain Hotel in Elmira.

Approximately 50, including doctors from vicinity towns, attended the event which opened with dinner.

Dr Dodge, whose topic was "Rheumatic Fever and Allied Diseases in Children," stressed the value of regular physical examinations and the need for training to detect the disease in its early stages.

Dr George R. Murphy, president of the medi-

cal society, conducted the session, the third in a series of six scheduled postgraduate lectures on pediatrics. The next meeting, April 9, featured a talk on "Growing Feet of Children," by Dr R. Plato Schwartz, professor of orthopedics at the University of Rochester.

A proposal that the city of Elmira relieve city physicians of medical care of nonhospital welfare patients, allowing the patients to go to doctors of their choice was made to the City Council on March 10 by Dr George R. Murphy, president of the county society.

"The society suggests that better care will be given and hospitalization will be less and more money saved for the taxpayer by abolishing those duties of the city physician which entail giving medical care to the city welfare clients," Dr Murphy said. "Further savings will result because such medical care will be reimbursed by the state to 40 per cent. The patients would go to the doctor of their choice."

Dr Murphy also suggested that the city make an annual appropriation of \$10,000 for the medical society in recognition of the services of staff physicians of the two Elmira hospitals in caring for welfare patients without pay. A similar request was made of the Board of Supervisors.

The money would be used by the society to increase medical welfare of the community by scholarships, lectures, and improving the medical library.

The society believes that the \$10,000 would be saved to the taxpayer by better medical care if a proposed change in the medical relief setup is adopted.

Dr. Murphy asked that supervisors consider construction of a building to house a centrally located county laboratory, larger and more adequate dispensary for clinics—orthopedic, dental, social hygiene, prenatal, child welfare, toxoid, and mental—and better offices for the city health officer.

Dutchess County

The county society has endorsed the Medical Expense Fund, of New York City, and it is expected that a campaign for membership will be started.

At the meeting of the society on March 12, the speaker was Dr Thomas J. Kirwin, senior attending surgeon at New York Hospital. He spoke on "Hematuria."

Dr Edgar Powell, of Fishkill, vice-president of the society, presided in the absence of Dr James T. Harrington.

About 75 members attended.

Erie County

Establishment of a municipal "blood bank" by the Buffalo City Health Department, intensified public education on the need for prenatal care, conservative treatment of toxemias of pregnancy, and better hospital control of cesarian operations were among the recommendations made on March 17 by the obstetric

council of the county society for reducing the maternity death rate

The council's report, read at the society's meeting in Hotel Statler by Dr Edward P Forrester, chairman, showed that there were 43 deaths in 10,548 deliveries in 1940

Emphasizing that 7 deaths resulting from hemorrhages might have been saved by early transfusions, Dr Forrester urged that hospitals not having one already establish a "blood bank" and that the city health department also make one available to physicians in home cases

To counteract the "slurs" made on the medical profession recently, Dr Carlton E Wertz, former president, read into the society's record a resolution summarizing what the profession has done so far toward national preparedness

The society voted in favor of changing its meeting date from the third Monday of each month to the fourth Tuesday

Arrangements have been made to give a dinner to the state and Federal legislators

A plan of health and accident protection approved by the Insurance Committee and Comitia Minora was adopted.

Through this plan the society is able to make available valuable disability protection to members on a basis not obtainable individually

The Association of Family Physicians met at the Buffalo Athletic Club on March 25 The speaker was Dr M A Hershey

The Buffalo Academy of Medicine met on March 19 at the Museum of Science and listened to a paper on "The Patent Ductus Arteriosus and Its Surgical Treatment," by Dr Robert E Gross, Peter Brent Brigham Hospital and Children's Hospital, Boston, with discussion by Drs Werner J Rose and Leon J Leahy

On March 26, the academy heard an address on "Pitfalls in the Diagnosis of Undulant Fever by Laboratory Methods," by Dr Walter M Simpson, Kettering Institute for Medical Research, Miami Valley Hospital, Dayton, Ohio

On April 2, Dr Francis J Carr, associate surgeon, Ruptured and Crippled Hospital, New York City, spoke at the academy on "Orthopedic Conditions Met with in General Practice"

On April 9, the academy heard an address by Dr Chester F Keefer, of Boston, on "Causes of Obscure Fever"

The following have been nominated for office for the 1941-1942 session of the Buffalo Academy of Medicine: president, Dr George E Slotan, secretary, Dr A. Wilmot Jacobsen, assistant secretary, Dr Clyde A Randall, treasurer, Dr William F Jacobs, and trustee, Dr Frederick T Schnatz

The next meeting of the Medical Society of the County of Erie will take place on April 21 in the Hotel Statler at 9 00 P M

Dr Clifford Rispen Orr, 74, of Buffalo, who died on March 15, had been director of roentgenology at the Edward J Meyer Memorial Hospital the last 22 years and was professor of radiology in the University of Buffalo Medical College.

Dr Wayne J Atwell, 51, head of the department of anatomy of the University of Buffalo Medical School, died on March 27

Fulton County

Dr Porteous Johnson, attending surgeon at the New York Post-Graduate Hospital, spoke before the county society on March 7, in the Eugene Littauer Memorial Laboratory, on "Fractures of the Humerus and the Femur"

Dr Walter Ludlum, Jr, of New York City, attending surgeon at the New York Post-Graduate Hospital, addressed the county society at the Eugene Littauer Memorial Laboratory, on March 21, on "Care of Fractures of the Forearm and Leg"

Jefferson County

The regular monthly meeting of the county society was held on March 13 at the Black River Valley Club Dinner was served at 6 30 The program was devoted to a discussion of "Alcoholism"

The speaker was Dr Eugene Boudreau, professor of neuropsychiatry at Syracuse University

Kings County

The following scientific program was presented at the meeting of the county society on March 18 (a) Address—"The Selection of Operation for Prostatic Obstruction," by Dr Reed M Nesbit, Ann Arbor, Michigan, (b) Address—"American Health and National Defense," by Dr Nathan B Van Etten, Bronx, New York.

The society adopted resolutions disapproving proposed state recognition of chiropractic and the city department of health's proposal to collect a \$1 00 fee from physicians for premarital serologic tests and use the resulting revenue for the building of an experimental laboratory

Dr Van Etten, president of the A.M.A., urged mobilization of all health agencies for national defense and creation of a Federal Department of Health but warned against "surrender of the practice of medicine to government control"

Pointing out that Senator Robert A. Taft and Federal Security Administrator Paul V McNutt are among the prominent government officials who have endorsed the addition of a Secretary of Health to the President's Cabinet, he urged

"Let physicians take the leadership for which their education qualifies them—let them emerge from their conservative shells and demand sane and progressive action for better conditions of medical service, and let them educate all the people in their own communities and ask their cooperation in developing a sound program for American health"

The county society has launched a drive for funds for a new building

The Brooklyn Thoracic Society met on March 21 with a program devoted to "Gastrosopic Examinations" and "Surgical Treatment of Carcinoma of the Esophagus"

Monroe County

The county society endorsed the proposed Rochester meat inspection ordinance at the meeting in the Academy of Medicine on March

18, holding that the "consumer public is entitled to that adequate protection."

At the same time, the society backed the "splint-them-where-they-lie" educational program sponsored by the Red Cross and public and civic safety groups and also approved continuation of Sunday afternoon lectures in co-operation with the Academy and the University of Rochester Medical School.

Commendation of the cooperation of the Pharmaceutical Association in 150 city and county drugstores in the antiseif-medication campaign was voiced by Dr Benjamin J Slater, public health chairman. Reports from physicians show favorable results, particularly in treatment of gonorrhea and syphilis, he said.

Dr Abraham H Aaron, University of Buffalo Medical School faculty member, recounted results of a survey of 3,000 Erie County prescriptions and offered suggestions as to means of assuring "tailor-made doses."

Dr Clarence P Thomas, medical defense chairman, reported that 234 physicians, half the society's membership, are voluntarily donating services as selective service examiners.

A maternal welfare teaching day was conducted at the University of Rochester School of Medicine on April 9. The subjects presented included "Blood Plasma, Transfusions, etc.", "Analgesia", "Treatment of Posterior Positions", "Episiotomy", "Emergencies of the Third State of Labor", and "Breech Delivery." At the Rochester Academy of Medicine at 8 45 Dr Ferdinand J Schoeneck, assistant professor of clinical obstetrics, Syracuse University, spoke on "Normal Labor, Sepsis, and Intercurrent Diseases."

Nassau County

The scientific program at the meeting of the county society on March 25 was as follows: "Direct Supravascular Extraperitoneal Cesarean Section." Illustrated by slides and natural color motion pictures. The speakers: Dr Raymond J Pieri, Memorial Hospital, Syracuse, and Dr Francis R. Irving, Memorial Hospital, Syracuse. Discussion was opened by Dr Edward G. Waters, Margaret Hague Maternity Hospital, Jersey City.

Splendid cooperation has been shown by Nassau County physicians in response to the law which went into effect on January 1, 1940, making cancer a reportable disease, we read in the *Nassau Medical News*.

During this first year, 1,133 cases of cancer were reported among county residents—a rate of 278.5 per 100,000 population. An interesting analysis of these cases has been made by Dr Earle G. Brown, Commissioner of the Health Department. With his permission, a summary is presented here.

There were 502 cases reported in males and 631 in females. However, if we exclude all cases peculiar to only one sex, the totals are nearly the same: males, 418 and females, 443.

The primary location of the new growth in the 1,133 cases are reported as follows: oral cavity and pharynx, 84, digestive tract and peritoneum, 297, respiratory system, 64, uterus, 143, other female genitalia, 45, breast, 176, male genito-

urinary tract, 90, skin, 124, bone, 30, other and unspecified organs, 80.

The fourth annual cancer institute was held on March 31 at the Rockville Country Club. At the luncheon the speakers were Mrs Walter T. Loebmann, "The Educational Program of the Nassau County Cancer Committee", and Dr Eugene H. Coon, "Cancer Education in Secondary Schools in Nassau County."

At the afternoon session (225 men and women attended) Dr Francis Carter Wood spoke on "Recent Advances in the Field of Cancer Research", Dr Eugene F. Traub, on "The Prevention and Early Treatment of Cancer of the Skin", and Dr Arthur C. Martin on "The Care of the Nassau County Cancer Patient."

A total of twenty-seven Nassau county doctors, including seventeen members of the medical society, have been assigned to active military duty, it is announced.

New York County

The scientific program of the county society at its meeting on March 24, was as follows: (1) "The Ballistocardiograph—A New Method for the Detection and Investigation of Disease of the Heart and Circulation—Results Obtained in the Commoner Clinical Conditions," by Dr Isaac Starr, University of Pennsylvania School of Medicine, Philadelphia, by invitation, (2) "Some Tests of Pulmonary and Circulatory Function—Their Application in Clinical Diagnosis and Treatment," by Dr Dickinson W. Richards, Jr., and Dr Andre Courmand, Presbyterian and Bellevue hospitals, by invitation, discussion—Dr Henry A. Schroeder, by invitation, Dr Hilbert A. Ranges, by invitation, Dr Max Pinner, by invitation.

Professor Walter J. Meek, of the University of Wisconsin, addressed the Harvey Society at The New York Academy of Medicine, on March 20, on "Cardiac Effects of Inhalant Anesthetics."

The section of ophthalmology of The New York Academy of Medicine discussed "Tumors of the Eye and Adnexa" at the meeting on March 17.

A combined meeting of the sections of medicine and surgery of The New York Academy of Medicine was held on March 18, and papers were read and discussed on various phases of hypertension.

A symposium on postoperative complications was presented before The New York Academy of Medicine section of genitourinary surgery on March 19.

Instead of the regular meeting of the section of otolaryngology at The New York Academy of Medicine, the section held a combined meeting with the section on otolaryngology of the College of Physicians of Philadelphia, at their building in Philadelphia, on March 19.

The New York Roentgen Society met on March 17, and listened to papers on tuberculosis of the breast, radium dosimetry, contact therapy, and cancer of the larynx.

The New York Academy of Medicine section of obstetrics and gynecology met on March 25,

and heard addresses on fracture of the femoral neck following roentgen therapy for gynecologic malignancy, and the theca-interna cone and the ascensus of the Graafian follicle

The New York Pathological Society, at its March 27 meeting, discussed tumors of the eye and histological changes produced in squamous cell epitheliomas of the mouth and oropharynx by fractionated external irradiation

New York's women doctors are again renewing their efforts to be classed as eligible for the Medical Reserve Corps of the Army and Navy. The Women's Medical Association will present a resolution to the county society asking that a recommendation of military status for their group be forwarded to the House of Delegates of the Medical Society of the State of New York.

The issue is expected to come up for a vote at the April meeting of the county society, and, if acted upon favorably, it will be laid before the House of Delegates of the American Medical Association at its annual meeting in Cleveland in June.

Oneida County

Dr T P Magill, of Cornell Medical College, New York City, addressed the Utica Academy of Medicine on "Influenza" on March 20. Discussion was opened by Dr T Douglas Kendrick. Dr Duncan Whitehead read a paper on "Aviation Medicine."

Ontario County

Under the topic, "Mental Hygiene in Panama," Dr C Harvey Jewett addressed the Canandaigua Medical Society on March 14 in the Canandaigua Hotel. Dr Charles J Bobeck was host, with dinner served to 11 members and a guest, Dr G J Winthrop. Dr H K. Meyers, president, presided.

Otsego County

The March meeting of the county society was held on the twelfth at the Hotel Oneonta. Following dinner and a brief business session, the first of the 1941 postgraduate lecture series was given by Dr A F R. Andresen, professor of clinical medicine at Long Island University Medical School, on the topic "Dietary Therapy in Gastrointestinal Diseases." Other lectures are April 9, "The Diabetic Patient and the General Practitioner," Dr Milton B Handelsman, associate in medicine, May 14, obstetrics, Dr Mervyn B Armstrong, assistant clinical professor of obstetrics and gynecology, and June 11, "Some Problems in Cardiac Diagnosis," Dr J Hamilton Crawford, professor of clinical medicine.

Queens County

The county medical society met with the county bar association on March 25. The program was "Trauma and Neurological Medical Problems." Dr George I Swetlow, consulting neurologist to Cumberland Street Hospital, assistant neurologist to Caledonian Hospital, associate, Peripheral Anesthesia, Beth-El Hospital, Discussion—Dr Raphael Lewy, chief medical examiner for the State Industrial Commission, and Harry I Huber,

Esq, counsel to the Medical Society of the County of Queens, Inc, Remarks by Joseph Conroy, Esq, president of the Queens County Bar Association.

The Friday afternoon talks in April are April 4, 4 30 P M—"Granulomas and Adenopathies," by Dr Meyer Rabinowitz, physician, Jewish Hospital, consulting physician, Greenpoint Hospital, April 18, 4 30 P M—"Applied Neurology for the General Practitioner," by Dr Foster Kennedy, physician-in-charge, neurology, Bellevue, consultant, Neurological Institute, New York, Lenox Hill, and Women's hospitals.

Rensselaer County

The treatment of pneumonia and the progress made in recent years toward reducing its death rate was discussed by Dr Maxwell Finland, chief of the pneumonia service at Boston City Hospital, in addressing the county society on March 11 at the Hendrick Hudson Hotel.

Richmond County

The regular monthly meeting of the county society was held on March 12, in the auditorium of the Richmond Borough Health Center.

After a short business meeting, the scientific program was introduced. The president, Dr Herbert A Cochrane, invited Dr John H Mulholland, assistant dean of New York University, School of Medicine, to present a talk at this meeting. Dr Mulholland's topic was "Intern Education." Professor Clarence C Stoughton, of Wagner College, Staten Island, spoke on "The Work and Importance of the Staten Island Community Chest." A third speaker was Dr Herman Friedel, a member of the society, who spoke on the "Work of the Staten Island Cancer Committee."

A Radio Committee is being formed.

Schenectady County

The county society met at the Glenridge Sanitarium on April 1 and heard an address by Dr J Maxwell Chamberlain, principal thoracic surgeon at the State Tuberculosis Hospital, Homer Folks Hospital, at Ray Brook and Oneonta, and consulting thoracic surgeon at the Schenectady County Tuberculosis Hospital, on "Recent Advances in Thoracic Surgery."

Physicians from Schenectady and Scotia are giving lectures on first aid before Legion posts for use in possible emergency.

Steuben County

Corning was host to the April meeting of the county society, held at the Baron Steuben Hotel on April 10.

Papers were given by two Syracuse physicians who were on the program for the November meeting, but were prevented from coming by a bad storm.

They were Dr John C M Brust, on the subject, "Diagnosis and Management of Common Ano-Rectal Diseases," and Dr John Alsever, "Organization of a Plasma and Blood Transfusion Service in the Syracuse University Medical Center."

Yates County

Members of Yates County Welfare Department and county society have appointed a joint committee, consisting of representatives from each group to study the costs of medical care for Yates County indigents. Consideration will be

given to adoption of a local medical plan that will meet approval of the New York State Department of Welfare and will eliminate several unsatisfactory features that under the present setup call for prior approval of the state group on many items.

SCIENTIFIC SESSION—AMERICAN ACADEMY OF PHYSICAL MEDICINE

The American Academy of Physical Medicine will hold its Nineteenth Annual Meeting and Scientific Session on April 28, 29, 30, 1941, in New York City, with headquarters at the Hotel Pennsylvania, where lectures, symposiums, clinical papers, motion pictures, and exhibits will be presented. Clinics will be held at the Medical Center, New York Orthopedic Hospital, Post-Graduate Hospital, and the Skin and Cancer Hospital. There will be an evening session at The Academy of Medicine Building and a banquet at the Hotel Pennsylvania.

Physical medicine in relation to general medicine and the specialties will be the underlying theme of the topics under discussion. These include new developments in electrotherapy, electrosurgery, radiation therapy, hydrology, physical education, military medicine, aviation medicine, and laboratory reports on related investigation.

The sessions are under the direction of Harold D. Corbuser, M.D., Plainfield, New Jersey, president, Herman A. Osgood, M.D., Boston, secretary, Fred H. Albee, M.D., New York City, chairman of the Committee on Arrangements, William D. McFee, M.D., Boston, chairman of the Committee on Program, William Benham Snow, M.D., New York City, chairman of the Committee on Clinics, Franklin P. Lowry, M.D., Newton, Massachusetts, chairman of the Committee on Exhibits, and Robert S. Harris, Ph.D., Cambridge, Massachusetts, chairman of the Committee on Research.

All members of the medical profession and those of related interest are invited to attend the scientific program. There will be no registration fee.

Address inquiries to Herman A. Osgood, M.D., secretary, 144 Commonwealth Avenue, Boston, Massachusetts.

Workmen's Compensation Fee Schedule—Multiple X-Ray Fees

The Industrial Commissioner on March 12, 1941, promulgated the following revision of the Fee Schedule affecting multiple x-ray examinations by physicians authorized under the Workmen's Compensation Law to examine and treat compensation claimants. By agreement, this revision will affect all bills not paid on November 15, 1940, and thereafter. It is to be noted that this revision applies to multiple x-ray examinations made at one time.

"X-rays of multiple injuries or parts shall be charged as follows

"(a) For two contiguous parts, the charge shall be the greater fee plus 50 per cent of the lesser fee

"(b) For two remote parts, the charge shall be the greater fee plus 75 per cent of the lesser fee

"(c) For three or more parts, whether contiguous or remote, the charge shall be the greatest fee plus 75 per cent of the total of the lesser fees

"(*) There shall be no charge under this formula for x-rays of two or more parts or regions included in any line item of the minimum fee schedule

"No charge shall be made for comparative x-rays except when such x-rays are specifically authorized by the carrier or industrial commissioner. Comparative x-rays specifically authorized shall be subject to fees for contiguous and remote parts as provided in this formula."

It should be noted that paragraph (*) of the new schedule means that there shall be no charge under this new schedule where the old schedule already allows a discount for more than one part, as for example

Items 889, 890, 1089, 1089-a, 1230, 1231—thus, if a head and face (875) and two spinal regions were x-rayed by a physician with a rating of "SD," the regular fee for the examination of the head, \$20, would be paid and item 889, or \$25, for the two spinal regions, a total of \$45. Item 889 is already discounted and, therefore, not affected by the new rule. If, however, a head and face and cervical spine (884) were x-rayed, the head fee of \$20 would be paid in full, being the greater part, plus one-half of item 884, this being a contiguous single part and not already discounted as in item 889.

If a head and one lumbar region (886) were x-rayed, the full head fee would be paid plus three-fourths of the lumbar region fee, since this is a remote part and not a contiguous one.

If the head were x-rayed and the cervical and thoracic spine, the full fee for the head would be paid plus item 889 for two spinal regions, or \$25, making a total of \$45.

If a head were x-rayed and, at the same time, if an x-ray of the chest and of the humerus were taken, the head or greatest item would be paid in full, and three-fourths of the total of the other two items would be paid, according to the new schedule.

DAVID J. KALISKI, M.D.
Director

March 19, 1941

NEW YORK STATE DIETETIC ASSOCIATION

The New York State Dietetic Association will hold its annual convention at the Hotel Statler, Buffalo, New York, May 1 and 2. The trend of the entire program will be national defense covering community education, surplus food problems, and newer trends in nutrition. The afternoon of May 2 will be given over to a panel discussion of the defense problem with the following representatives of specific fields partici-

pating: Miss Gladys Cram, Buffalo, Visiting Nurse Association; Miss Ethel Coan, Buffalo, Home Economics Association; Miss Blanche Bohach, Rochester, Dietetic Association; Miss Lenna Cooper, New York City, Hospital Dietitian; Mame T. Porter, Albany, Home Economist in Social Work; and Mary Switzer, Buffalo, Home Economist in Extension Work.

Woman's Auxiliary

To the Medical Society of the State of New York

WE ALL hope to meet for the convention in Buffalo. Let our motto be—Erie County here we come—100 per cent strong!

County News

Cayuga. A business session and bridge tea was held at the home of Mrs. Everet Wood, of Auburn. Because of bad road conditions the February meeting was postponed.

Erie. Aside from convention preparations and business sessions, the Erie County Auxiliary finds time to entertain the medical society at a Wisteria Ball at the Hotel Statler, April 19. All decorations have been created and contrived by auxiliary members. This event promises to be an outstanding affair. Mrs. Allen E. Richter and Mrs. Wm. Rennie are the chairmen.

Fulton. Mrs. J. Edward Grant, of Northville, was elected president at the annual meeting which convened in March. The following officers will assist her: president-elect, Mrs. John A. Shannon, Johnstown, first vice-president, Mrs. Claude Bledsoe, Gloversville, second vice-president, Mrs. Richard Furlong, Gloversville, recording secretary, Mrs. Francis Hyland, Gloversville, corresponding secretary, Mrs. Frank G. Calder, Johnstown, and treasurer, Mrs. Vernon R. Ehle, Gloversville. Three directors chosen are Mrs. George Lenz and Mrs. Leslie Backus, Gloversville, and Mrs. Frederick Sarno, of Johnstown. Two new members, Mrs. Joseph J. Thompson and Mrs. Samuel Russell, of Gloversville, were accepted. The retiring president, Mrs. Burlin G. McKilip, was presented flowers in appreciation of her work as head of the group for the past year.

Kings. The sixth anniversary of the group was celebrated at La Guardia Field by holding a special luncheon party. Mrs. Louis Harris, president of the organization, welcomed the guests. Mrs. Samuel Zwerling was chairman. After the luncheon the party was taken on a tour through the hangars.

Montgomery. At the March meeting Miss Mildred Constantine, superintendent of the City Hospital, spoke on group hospitalization. She told of the benefits of this plan to the patient and doctor and stressed other matters pertaining to the welfare of the hospital. To date there are forty-four members enrolled. Real enthusiasm has been shown by this auxiliary.

Nassau. Mrs. William Burke introduced Dr. Charles Bove, former chief surgeon of the American Hospital in Paris, who was the guest speaker at a recent meeting at the Nassau Hospital auditorium in Mineola. His subject was "Civilian Defense in Time of War." He mapped out a practical program for a medical unit auxiliary. During March, Mrs. A. C. Martin was proud to present to the interest of her auxiliary the well-known surgeon, Dr. J. F. Erdmann of the Post-Graduate Hospital. He reviewed his experiences in the practice of medicine over a half century. New members added to the roster were Mrs. A. Fincke, of Garden City, Mrs.

Thomas Biondo, of Freeport, and Mrs. S. A. Dallgaard.

Oneida. Dr. Moses M. Bragg, historian, tells us that the Oneida County Medical Society was formed from a quota of "Twenty-nine Medical Gentlemen," in Rome, in 1806. With this in mind and after much thought and inquiry, forty-one wives of Medical Gentlemen met in the Hotel Utica, Utica, on October 3, 1940, and formed the Women's Auxiliary of the Oneida County Medical Society. The present membership is eighty-seven. Mrs. Neil D. Black reports "January—following a business meeting, delightful informal talks were made by Mrs. J. J. Buettner and Mrs. E. Neptune, of Onondaga County, at a luncheon meeting February—There were forty-eight members present at a luncheon and short business session. Mrs. J. I. Farrell, president, introduced Mrs. A. Van der Veer, Jr., who in her usual charming manner interested the audience in medical legislation March—A dessert party was followed by a talk on nursing as a defense factor by Miss Stella Jenkins. Mrs. F. B. Lee emphasized the importance of the Red Cross, and Mrs. I. Fitzsimmons told of what nutrition means in building up the strength of the nation. Delegates to the state convention are Mesdames J. I. Farrell, A. Sloan, and F. M. Miller. Our meetings have been pleasant socially and interesting and instructive mentally. From each one we have learned something of medical history, foreign affairs, or facts of national importance. While we are yet too young to have reached our big objective, we feel we have accomplished something in getting to know one another. And in time, as our membership grows and interest increases, with the help of our advisors we will find our niche of usefulness in the community. Oneida County will be proud of its Women's Auxiliary."

Queens. A successful testimonial dinner was tendered to Mrs. L. H. Kice, state president, at the Forest Hills Inn. On this occasion the guest of honor delighted her audience with an interesting address. An additional program was provided by Miss Charlotte Wilkinson through the courtesy of R. H. Macy and Co., her topic was "Fashion Do's and Don'ts." Five new members were admitted.

Rockland. The British War Relief Society, has named Mrs. Trevalyn Omstead, of Pearl River, auxiliary president, as chairman of a committee to collect vitamin pills, medical supplies, and instruments. Mr. K. R. MacCalman, Rockland County representative of the society, gave pertinent facts on the need of all available materials. At the business session the reports of committee chairman showed continued progress in Rockland County.

Schenectady. At the March meeting Mrs. C. W. Woodall, public relations chairman, presented Mrs. T. Y. Chien who spoke on "The Conditions in China and the Needs of the Chinese People." The auxiliary will cosponsor with the Schenectady chapter of the American committee for medical aid to China a benefit concert.

to be held May 17 in the Union College Memorial Chapel. Dr Robert C. Maxon is acting chairman for Schenectady County. A program of "Legislation on Parade" was given by the study group on medical legislation of which Mrs Alfred Grussner is chairman. A donation was made toward the Campership Fund of the Schenectady Girl Scout Council and another to the Girls' Club of Schenectady. The group will be in charge of the April birthdays at the Eastern New York Orthopedic Hospital under the direction of Mrs H W Galster. Mrs A W Greene,

president, announced that during the past year the names of twenty doctors' wives were added to the membership list.

National Convention to A.M.A.

The annual meeting of Women's Auxiliary to A.M.A. will be held June 2 to 6, 1941, in Cleveland, Ohio. The headquarters are at Hotel Carter. Reservation requests should be sent immediately to Dr Edward F. Kieger, chairman of Committee on Hotels and Housing, 1640 Terminal Tower Building, Cleveland, Ohio.

IMPORTANT CONFERENCE ON INDUSTRIAL MEDICINE

A "postgraduate" Institute of Industrial Medicine and Industrial Hygiene, attracting industrial health specialists from all parts of North and South America, will be held in Pittsburgh, May 5 to 9. Scores of pertinent papers are scheduled on the medical and engineering phases of employee health protection.

The Institute marks the twenty-sixth annual meeting of the American Association of Industrial Physicians and Surgeons and the second annual meeting of the American Industrial Hygiene Association. Majority of the sessions will be held at Pittsburgh's William Penn Hotel.

A series of important dry clinics in Industrial Medicine and Surgery will be held at Mercy Hospital on the first day, Monday, May 5. John P. Griffith, M.D., chairman of the hospital clinic committee and professor of surgery, School of Medicine, University of Pittsburgh, will be in charge.

One of the highlights of the day will be a consideration of diagnosis and treatment of various "Industrial Backs", another will be a discussion of pneumonia and its treatment with special reference to the use of some of the newer drugs, such as sulfathiazole.

The Hon Cornelius D. Scully, mayor of Pittsburgh, will welcome the delegates on Tuesday, May 6. Other addresses of welcome will be made by Frederick Jacobs, M.D., president, Allegheny County Medical Society, and J. T. Shaw, secretary of health, Commonwealth of Pennsylvania. Response will be made by Daniel L. Lynch, M.D., president of the American Association of Industrial Physicians and Surgeons, and Mr. Warren Cook, president, Industrial Hygiene Association. Dr. Lynch will make the president's address, after which the following subjects will be presented and discussed: (1) "Practical Results of Periodic Physical Examinations," by A. J. Kammer, M.D., medical director, Inland Steel Company, Indiana Harbor, Indiana, (2) "Relation of Trauma to Disease," by A. H. Colwell, M.D., associate professor of medicine, School of Medicine, University of Pittsburgh, (3) "Contact Dermatoses," by W. H. Guy, M.D., professor of dermatology, School of Medicine, University of Pittsburgh.

Tuesday afternoon will be devoted to presentations and discussions of the following subjects: "Sequelae of Head Injuries", "Trauma Other Than Fractures", "Mental Hygiene in Industry", and "Evaluation of Circulatory Function in Extremities". Individual group conferences will be held on Tuesday evening.

Wednesday morning will be devoted to recent

research on such subjects as carbon monoxide poisoning, effects of radiation from an ophthalmologic point of view, and various aspects of industrial lead exposures and lead poisoning.

Tuberculosis problems will be the main topic of discussion on Wednesday afternoon, including engineering preventive methods in the control of tuberculosis, other methods of prevention and control, and also discussions of bacteria in the air and problems of disinfection and ventilation.

A banquet will be held Wednesday evening at which principal speakers will be Dr. Irvin Abell, chairman of Health and Medical Committee, Federal Security Agency, discussing the role of industrial medicine and hygiene in national defense, and V. O. Knudsen, dean of the Graduate School, University of California, Berkeley, speaking on "Noise and Hearing."

Industrial ventilation problems will be considered on Thursday morning. Subjects to be discussed are control of gases, vapors, and fumes, electroplating operations, air-borne infections, radiant cooling, and also studies of recent dust-determination methods including concentration and free silica content.

Industrial hygiene dust studies are scheduled for Thursday afternoon. This will include investigations in the chrome brick industry, lead and zinc mining, copper refining, and Fuller's earth as a cause of pneumoconiosis. Papers will also be read on particle sizes of dusts as found in various industries, animal and petrographic studies on talc dusts, and silicosis among naval foundry men.

Thursday evening's session includes miscellaneous subjects: a review of industrial hygiene progress during 1940, claims of industrial poisoning, medicine and engineering evaluation of exposures in the synthetic sausage and casing industry, sampling and determination of aldehydes, and the absorption and elimination of noxious vapors.

Friday morning's session includes a report on dermatitis control in a mass production industry, sporotrichosis as an occupation disease among florists, common solvent exposures, electric arc welding, gases, fumes, and vapors from coated welding rods, trends in occupational disease, and eye protection in industry.

The Institute concludes its symposiums on Friday afternoon with discussions of the following subjects: controlled radium hazards, phosphorus toxicology, biochemistry of carbon bisulfide, new synthetic chemical, toxicity of 1-1-dichloro-1-nitro-ethane, toxicity of methyl silicate, and toxic effects on animals of methyl, ethyl, and butyl methacrylates.

Attention—All Members

From the Winthrop Chemical Company, Inc , of 170 Varick Street, New York City, there came on April 3, 1941, the following statement together with information that it is being sent to all hospitals, wholesale druggists, and retail pharmacists

PETER IRVING, M D , Secretary

SULFATHIAZOLE-WINTHROP

Important Notice

In the manufacture of tablets of Sulfathiazole-Winthrop, "M.P " control series (December, 1940), some of the tablets were accidentally contaminated with phenobarbital. Immediately upon discovery of this, active steps were taken by us to recover this entire series

Our attempt to assure the return of all tablets of the "M P " control series is being continued, in conjunction with the nationwide effort of the U S Food & Drug Administration and other public agencies. In the interest of public safety, your prompt cooperation with us and with these public agencies in this search will be greatly appreciated, as these contaminated tablets may be dangerous.

Please examine the mark on every package of our Sulfathiazole tablets, and return to us immediately for exchange any package marked with the letters "M P ". If you have dispensed tablets from bottles bearing these control letters, will you kindly endeavor to recover all such tablets which have not been consumed.

Needless to say, this occurrence is a matter of profound regret to us. Nothing of this nature has ever happened before in our history, and we are taking extraordinary precautions to prevent a recurrence. For more than two decades we have served the medical and pharmaceutical professions. During that period we have earned a reputation for high standards and outstanding products which we shall strive faithfully to maintain.

HEMATINIC PLASTULES*

The Modern Iron Therapy

● Hematinic Plastules provide ferrous iron in small soluble elastic capsules—a modern, convenient dosage form. Where iron therapy is indicated, Hematinic Plastules can usually be relied upon to bring about a steady, rapid rise in hemoglobin. Their administration is seldom complicated by gastric disturbance. Hematinic Plastules are an economical iron preparation especially effective for the treatment of the iron deficiency anemia of pregnancy, for chronic blood loss, or post-infection anemia.

Reg. U. S. Pat. Off.

Hematinic Plastules are available in two types, Plain or with Liver Concentrate, in bottles of 50 and 100.

THE NATURAL MINERAL WATERS OF SARATOGA SPA ARE OWNED AND BOTTLED BY THE STATE OF NEW YORK

*Where the Natural Mineral Waters
of Saratoga Spa differ from
Artificial Mineral Waters*

- 1 The minerals are present in complex combinations impossible of laboratory duplication
- 2 The natural carbonation and mineralization of the Saratoga Waters take place under conditions of pressure, temperature and duration which are only possible with Mother Nature, and with Saratoga Spa
- 3 The great quantities of CO_2 allow for the ingestion of many of the mineral elements in a form which favors their rapid absorption and utilization in the body This is particularly true of iron
- 4 The labile form of the salts in solution is demonstrated by the fact that they undergo change upon evaporation in the air, and become in part insoluble

That is why the State bottles them by special processes which prevent all contact with air—and makes them available with the catalytic quality of the waters protected until the bottle is uncapped for use

For further commentary on the Waters and the indications for their use, see Spa Publication No 9 of which copies will be sent on request Address your inquiry to W S McClellan, M.D., Medical Director, Saratoga Spa, 155 Saratoga Springs, N Y

REVIEWED

Operative Surgery By J Shelton Horsley, M D, and Isaac A Bigger, M D Volumes I & II, Fifth edition Quarto of 1,567 pages, illustrated St. Louis, C V Mosby Co, 1940 Cloth, \$18 per set

The first edition of this work was printed in 1921 In it the author stressed the importance of preserving physiologic functions and the importance of proper interpretation of biologic processes, both of which are so essential to successful surgery but both of which are so often neglected by the surgeon These same important underlying principles are found in the subsequent editions of 1924, 1928, 1937, and in the latest edition of 1940

Before the fourth edition was printed, Dr Horsley invited Dr T A Bigger, professor of surgery at the Medical College of Virginia, to act as co-author Dr Bigger is well known for his work in thoracic surgery in addition to his work in general surgery His contributions, which are numerous, to this book are presented in a scholarly but practical manner

It is noteworthy that many of the newer surgical procedures, such as the operation for patent ductus arteriosus, segmental pneumonectomy, a new tube gastrostomy, excision of the duodenum and head of the pancreas, and Warthen's operation for benign rectal stricture, are described in detail The chapters on the surgery of the vascular system have all been rewritten The section on neurologic surgery has been completely revised and brought up to date The chapters dealing with the various plastic operations have been deleted of some of the older procedures and in their place appear descriptions of the most recently devised operations for these congenital and acquired deformities

Mention should be made of the 13,091 excellent illustrations that appear throughout both volumes It is felt that illustrations such as these are an essential contribution to any book on operative surgery

Drs Horsley and Bigger have brought the subject of operative surgery up to the minute in a most satisfying manner They have properly omitted procedures that have not stood the test of time They have wisely chosen the most universally accepted procedures and have plainly and simply presented them, so that the student, as well as the finished surgeon who is still a student, will find these volumes of real help

MERRILL N FOOTE

Foundations of Short Wave Therapy Physics, Technics, Indications By Wolfgang Holzer and Eugen Weissenberg Translated by Justina Wilson and Charles M Dowse Octavo of 228 pages, illustrated New York, Chemical Publishing Company, 1940 Cloth, \$5 00

Foundations of Short Wave Therapy originally published in German in 1935 and translated into English in 1935 as above A small volume of 224 pages, 155 pages are devoted to physics and technic and about 52 pages to medical application The physics and technic should be of value to the physicist or physiologist but, it is too much for the ordinary physician who uses the physical therapy to attempt to master The medical applications cover an insufficient amount

of cases and would not be acceptable to the American physician who needs more clinical data

The bibliography, both for the physics and medical section, only covers up to the year 1935 Considerable water has passed over the dam in the past five years, particularly in American physical therapy

JOHN J HAUFF

Synopsis of Materia Medica, Toxicology, and Pharmacology For Students and Practitioners of Medicine By Forrest R. Davison, B A Duodecimo of 633 pages, illustrated St Louis, C V Mosby Co, 1940 Cloth, \$5 00

Although small in size, this book furnishes a modern account of the useful older drugs and a satisfactory account of the newer ones The basic principles of pharmacology, materia medica, prescription writing, and toxicology are presented The drugs are classified, according to the parts of the body they act upon, in a way the author has found useful in teaching Vitamins, serum and vaccines, and hormones are all discussed Much information is furnished in a concise and attractive manner

W E McCOLLUM

Organization, Strategy and Tactics of the Army Medical Services in War By Lieut Colonel T B Nicholls, M B Second edition Octavo of 488 pages Baltimore, Williams & Wilkins Co, 1940 Cloth, \$5 00

This second edition, appearing but four years after the first, has been printed because of the demand for the first edition and because present mechanized and aerial warfare required important additions

Sections on transport of casualties by air, on the medical services of an antiaircraft division, and on emergency medical services of the Ministry of Health have been added to this edition. The volume is complete, concise, and accurate It presents in brief the entire medical service of the army with the different necessary organizations to care for casualties, medical or surgical.

It is a volume that should be studied by every medical man who in any way will have the care of our people in case of war

HENRY M MOSES

Your Mental Health or Between Mental Health and Mental Diseases For Intelligent Laymen and Physicians By B Liber, M D Octavo of 408 pages New York, Melior Books, 1940 Cloth, \$3 00

This book is another on mental hygiene intended to help the lay person cure himself However, contrary to so many similar books which have appeared in the past few years, it contains a great deal of good common sense

The author has made a serious attempt to enlighten individuals who suffer from conditions bordering on the psychoneuroses To this end he presents numerous brief case histories to illustrate the problem under discussion Similar reports by the author have appeared frequently in medical journals, and he has now made them a part of his book

For those who have a great deal of misin-

Independence Hall

This building, the cornerstone of which was laid in 1732, is the birthplace of our nation. In it were signed the Declaration of Independence and the Constitution of the United States. The famous Liberty Bell is still housed here.

BEPRON*

WYETH'S BEEF LIVER WITH IRON

BEPRON is a palatable, complete preparation for oral use in the prophylaxis and treatment of nutritional or deficiency anemias. Each ounce of BEPRON contains the total soluble constituents of two ounces of unfractionated beef liver, including

- Essential water-soluble dietary factors of liver;
- Specific anti-pernicious anemia fraction (Cohn),
- Secondary anemia fraction (Whipple) and
- Four grains of iron (Fe) as ferrous-ferric saccharate.

Supplied in eight-ounce and pint bottles

*BEPRON is a trademark of John Wyeth & Brother Incorporated for its palatable preparation of fresh whole beef liver with added soluble ferrous iron.

John Wyeth & Brother, Incorporated, Philadelphia

formation concerning sexual conflicts, masturbation, etc., the book will undoubtedly clear up many problems. However, it is doubtful whether it will really help persons suffering from a psychoneurosis and, in fact, may even make them more apprehensive and introspective.

Some psychiatrists will undoubtedly find fault with many statements made by the author, and he is probably correct when he states that they will be skeptical about the conversations and "cures" the author reports.

JOSEPH L. ABRAMSON

The 1940 Year Book of Public Health. Edited by J C Geiger, M D. Duodecimo of 560 pages, illustrated. Chicago, The Year Book Publishers, 1940. Cloth, \$3 00.

For the first time a volume on public health is added to the *Practical Medicine Series of Year Books*. The editor has selected articles pertaining to practically all activities usually included in a modern public health program.

In some respects, improvement might be made in the arrangement of material. A chapter is devoted to communicable diseases, but poliomyelitis and malaria are discussed under separate headings. Most of the articles on food and milk might be included in the chapter on communicable diseases. The amount of space given to the subject of housing seems to be inadequate. The 296 editorial comments are much to the point.

This is a book of value to the busy worker in the public health field. He will find many articles of interest not covered by his usual reading activities during the year.

F L. MOORE

Synopsis of the Principles of Surgery. By Jacob K. Berman, M D. Duodecimo of 615 pages, illustrated. St Louis, C V Mosby Co., 1940. Cloth, \$5 00.

This is a compact volume which, for one of its size, covers in a clear and concise manner the principles of surgery.

In glancing through the index, one finds the number of subjects listed equal to those found in larger volumes. A clear synopsis with excellent illustrations add greatly to the value of the publication.

It should prove an invaluable reference book to medical students and should occupy with grace a prominent place as a handbook on the desk of every physician and surgeon.

One might liken the book to a compend for quick reference with the additional advantage of descriptive diagrams and exceptionally clear photographs.

RALPH F HARLOW

Fractures and Dislocations for Practitioners. By Edwin O Geckeler, M D. Second edition. Octavo of 314 pages, illustrated. Baltimore, Williams & Wilkins Company, 1940. Cloth, \$4.00.

This excellent work has been brought completely up to date in the present edition. Written for the general practitioner, the author has attempted to consider all valuable procedures in detail. However, a reliable method of treatment is presented for the particular fracture described. Of especial value is the excellent discussion of

skeletal traction which is so essential in the treatment of many fractures of the lower extremities. The treatment of ankle fractures is ably presented. It is of interest to note that Pott's fracture, of rare occurrence, is accurately described. This is not the case in many fracture texts. There are some cases to which exception might be taken. For example it is stated that "displaced fractures of the capitellum cannot be reduced by manipulation and must be replaced by operation."

Many new photographs and x-ray reproductions have been added to this edition. There is a bibliography at the end of each chapter. The paper is of excellent quality and the type of good size. This book is strongly recommended.

MAYER E ROSS

The New International Clinics. Original Contributions, Clinics, and Evaluated Reviews of Current Advances in the Medical Arts. Edited by George M Piersol, M D. Volume IV, New Series Three. Octavo of 326 pages, illustrated. Philadelphia, J B Lippincott Co., 1940. Cloth, \$3 00.

This issue of the *International Clinics* contains a symposium of twenty-three clinics contributed by the faculty of the University of Louisville, School of Medicine. There are, in addition, eleven original contributions of practical importance and a review of the present status of the management of spreading peritonitis of appendiceal origin.

MILTON PLOTZ

Methods for Diagnostic Bacteriology. A Complete Guide for the Isolation and Identification of Pathogenic Bacteria for Medical Bacteriology Laboratories. By Isabelle G Schaub, A B, and M Kathleen Foley, A B. Octavo of 313 pages. St Louis, C V Mosby Co., 1940. Cloth, \$3 00.

This book contains a clear and precise description of the bacteriologic and serologic methods used in clinical bacteriology. In addition to the usual routine procedures it deals also with more complicated problems of diagnostic bacteriology. It is actually a good manual of bacteriologic and serologic technics. Throughout the book the presentation of the subject is based on the personal experience of the authors in the department of pathology and the laboratory of the medical clinic of Johns Hopkins University.

U FRIEDEMANN

The Histamine and Insulin Treatment of Schizophrenia and Other Mental Diseases. By Horace Hill, M R C P. Duodecimo of 133 pages. Baltimore, Williams & Wilkins Co., 1940. Cloth, \$1.75.

The author, a medical superintendent of a mental hospital in England, has written this book in response to many requests for details of his method of treating mental diseases with histamine and insulin.

He has had many years of experience with this treatment. It has been his opinion that shock encountered in insulin therapy was due to the liberation of histamine in the tissues. He therefore used small doses of insulin, 5 to 10 units, combined with 0.5 to 1.5 mg of histamine injected hypodermically daily for several months.

Hospitals and Sanitariums

Institutions of Specialized Treatments

PIONEERING AGAINST "INSANITY"

Some years ago a group of midwest hospitals promoted a campaign to wipe out the stigma persisting in connection with mental disease. In their opinion neither the laity nor the profession in general had been convinced up to that time that there should be no stigma attached to the fact that a patient had been in an "asylum" for treatment.

The first object of these hospitals was to re-educate the public in the use of the term "insanity." They emphasized that definitely it was not a medical term, but rather a social and legal word. As such its usage implied cases with mental disturbances of so marked a degree that legal measures were necessary for the protection of the patient and society.

This required protection brought about the establishment of the so-called asylum for protective measures rather than for the treatment of the unfortunate patients. Modern times have brought many changes, however, in

such an attitude. The care and treatment of mental cases is now essentially a medical problem with well trained medical and nursing staffs an absolute necessity for successful and proper handling of the problem.

Whether the laity and the medical profession entirely are taking a more reasonable attitude toward mental illness, it is difficult to judge. The medical profession is using the term "insanity" less and less and this is helping considerably to overcome the mark of disgrace in the public's feeling concerning the mentally ill. In neuro-psychiatric nomenclature, it is certain that the term has no place except perhaps when it is necessary to use it as a legal definition.

It is indeed unfortunate that the laity persists in regarding insanity as a weakness that the victim is personally responsible for, and an incident that even

FOR ACUTE, RECOVERABLE MENTAL CASES
(selected Drug and Alcohol cases accepted)

Eleven years of effective results from efforts devoted to the individual care of a small number of patients in a homelike environment without institutional atmosphere. All accepted modern therapies available. Moderate rates. For information—address

EUGENE N. BOUDREAU, M.D. SYRACUSE, N. Y.
Physician-in-Charge

[Continued from page 904]

He noted a marked improvement in the mental reactions of many of his patients. He cites case histories to illustrate the results obtained by his method.

Insulin and other shock therapies have become accepted methods of treatment in the psychoses, particularly in schizophrenia. The precise mechanism by which the improvement is induced is not yet quite clear. The author offers some plausible leads that may help to arrive at a reasonably convincing explanation of the manner by which insulin and the other forms of shock therapy act.

It is a practical and valuable small book that will prove useful to everyone interested in this particular phase of medicine.

IRVING J. SANDS

Bacteriology in Neuropsychiatry A Survey of Investigations Concerned with the Specific Role of Infectious and Immune Processes. By Nicholas Kopeloff, Ph.D. Octavo of 316 pages. Springfield, Charles C. Thomas, 1941. Cloth, \$4.50.

The author, who is research bacteriologist, New York State Psychiatric Institute and Hospital, presents in this volume the contributions that bacteriology and immunology have made to the study of nervous and mental disorders. He has made available in one book a widely scattered literature, and, because of his intimate knowledge of bacteriology, he is able to evaluate this information for us.

The contents of the book are divided into four sections: (1) the diseases of known etiology with primary involvement of the nervous system, (2) diseases of known etiology with secondary involvement of the nervous system, (3) diseases of unknown etiology involving the central nervous system, and (4) immunology of the central nervous system.

The short paragraphs devoted to symptomatology and pathology of each disease are entirely too brief to be of value. However, the value of the book lies in the author's discussion of etiology, epidemiology, and immunization of the various diseases which affect the nervous system.

JOSEPH L. ABRAMSON

Diagnosis and Treatment of Arthritis and Allied Disorders By H. M. Margolis, M.D. Octavo of 551 pages, illustrated. New York, Paul B. Hoeber, Inc., 1941. Cloth, \$7.50.

This volume presents a clear, concise, and beautifully illustrated study of the various forms of arthritis. No type of the disease has been omitted nor any phase neglected. The chapters dealing with atrophic arthritis are, however, particularly important. Dr. Margolis has carefully outlined the various forms of treatment and has thoroughly evaluated them. An especially complete study has been made of gold salt therapy. The illustrations accompanying the discussion of corrective and preventive measures in atrophic arthritis are clear and enlightening.

This book should be helpful to the general practitioner who so often is confronted by the difficult case of arthritis. The specialist may be well repaid by reviewing it, and the medical student should find the volume of value.

A. SIDNEY BARRITT, JR.

A Textbook of Clinical Pathology Edited by Roy R. Kracke and Francis P. Parker. Second edition. Octavo of 780 pages, illustrated. Baltimore, Williams & Wilkins Company, 1940. Cloth, \$6.00.

In the second edition of this book the authors present up-to-date methods used in the clinical laboratory and their interpretations. The means of obtaining specimens and various tests are clearly described and profusely illustrated. Among newer tests are the estimation of various hormones and vitamins in the blood and urine, sulfanilamide, sulfapyridine, and sulfathiazole, new procedures for the cultivation of bacteria, and many others. Each chapter is written by an expert and is extremely informative.

E. H. NIDISH

A Treatise on Medicolegal Ophthalmology By Albert C. Snell, M.D. Quarto of 312 pages, illustrated. St. Louis, C. V. Mosby Co., 1940. Cloth, \$6.00.

For many years the author has interested himself in medicolegal ophthalmology and especially in that phase relating to administration of the workmen's compensation laws with respect to visual defects resulting from eye injuries. He has made a number of contributions to the literature of these subjects and now brings together in this book the results of his study, research, and experience—the first complete treatise of its kind in many years. It contains a great deal of information and many suggestions for the improvement of existing laws in evaluating visual losses, stressing particularly the importance of functional loss—loss of use—rather than visual acuity loss as the basis for compensation.

The book is divided into three parts. Part I is titled "Some Essential Principles of Medical Jurisprudence and an Analysis of Compensation Laws as These Relate to Visual Disabilities." In this the author discusses the elements of expert testimony, malpractice, and certain phases of compensation laws. Part II is "Evaluation of Visual Disabilities—The Determination of Fractional Parts of Vision." In this he introduces chapters on the physiology of vision and the percentage evaluation of visual perception, both central and peripheral, and of the muscle function.

Part III is concerned with "Practical Application of the Visual Efficiency Computation to Medicolegal Practice," in which he enlarges upon his thesis that indemnification should be based upon functional efficiency values rather than merely upon visual acuity. This book is a valuable aid to all ophthalmologists who are interested in court work and especially to those who do compensation work. It is also to be hoped that it may come to the attention of legislators throughout the country in the interest of more uniform compensation laws in the various states.

PIONEERING AGAINST "INSANITY"

(Continued from page 909)

makes the entire family suspiciously sub-normal. They fail or refuse to recognize that it is a disease just as likely to strike anywhere as cases of pneumonia, tuberculosis or similar illness, that the causes are often everyday affairs to which they themselves are not absolutely immune.

It is unfortunate that a victim's family must feel that it is something to be hidden from friends and associates if possible, that they must try to cover up the misfortune and try to soften the unwarranted stigma by referring to the matter as a "nervous breakdown."

Probably nothing but time and a more enlightened people will become accustomed to the true light of mental conditions as being purely a disease and not some freakish prank of nature.

Certainly nothing short of sincere efforts on the part of the medical profession in helping to educate the public in overcoming superstitions and prejudices relative to nervous and mental diseases, can bring about a reform in ideas about the mentally ill. But while others who have not experienced the troubles and anguish of having had someone close to them fall a victim of mental collapse, still look upon such cases as something to be ashamed of, the family and the patient should be spared as much publicity as possible.

Privacy is the keynote of the private sanitarium, and this the patient is entitled to if circumstances permit. Among the sanitariums advertised in this section of the JOURNAL, are several fine institutions capably staffed and with histories of successful treatments.

They offer family physicians, the adequate facilities, personal care and scientific, specialized treatments so desirable for nervous and mental patients.

ELIXIR BROMAURATE

IS GIVING EXCELLENT RESULTS

IN WHOOPING COUGH

Shortens the duration of the cough, relieves the distressing spasms and gives the child rest and sleep. Also valuable in other PERSISTENT COUGHS and in BRONCHITIS and BRONCHIAL ASTHMA. In four-ounce original bottles. A teaspoonful every 3 to 4 hours.

GOLD PHARMACAL CO., New York

Say you saw it in the NEW YORK STATE JOURNAL OF MEDICINE

[Continued from page 908]

This monograph of Walters and Snell is a presentation of the experience and practice of the Mayo Clinic in the surgical treatment of diseases of the gallbladder and bile ducts. This experience, which covers nearly 40,000 cholecystectomies, is truly overwhelming. Because it is written from the point of view of the surgeon, the preoperative medical preparation of these cases is stressed, but little is said of the management of the nonsurgical patient. The general practitioner would welcome additional chapters by Alvarez dealing with functional disturbances of the gallbladder and with functional disturbances simulating gallbladder disease. The volume is beautifully illustrated and well indexed and should be a standard reference book for all interested in gastroenterology.

CARL H GREENE

Pharmacology and Therapeutics By Arthur R. Cushny, M D. Twelfth edition by C W Edmunds, M D, and J A. Gunn, M D. Octavo of 852 pages, illustrated. Philadelphia, Lea & Febiger, 1940. Cloth, \$6.50.

This classic, now in its twelfth edition, has been thoroughly revised and brought up to date. The present authors, who have kept this book alive since Cushny himself "ceased to write," have successfully carried it through the last four editions. In these days of hectic pharmacologic research and the intense interest manifested in therapeutics, it is an arduous task to maintain the scientific excellence of a work of this kind. Frequent revisions are necessary to eliminate those agents that are no longer useful to make room for the newer drugs of our modern armamentarium. Among the newer drugs included in the present volume, conservatively evaluated in the light of our present knowledge regarding them, are the "wonder drugs," sulfanilamide, sulfapyridine, sulfathiazole, and allied compounds. This book is highly recommended for students and practitioners.

FREDERICK SCHROEDER

Psychotherapy Treatment that attempts to improve the condition of a human being by means of influences that are brought to bear upon his mind. By Lewellys F. Barker, M D. Duodecimo of 218 pages. New York, D Appleton-Century Company, 1940. Cloth, \$2.00.

Dr Barker's modestly priced little volume will probably find a wide audience. Dr Barker restricts the use of the term "psychotherapy" to "treatment that attempts to improve the condition of a human being by means of influences that are brought to bear upon the mind," a definition that will satisfy his most critical readers. The book is readable, fair to most schools of psychotherapy, and a reliable guide to conservative methods of therapy. The advice given is usually helpful and sometimes remarkable, such as the advice that the married patient "should refrain from anything like philandering or spending too much of his time with, or money on, other women!" We wonder how much Dr Barker would consider "too much."

MILTON PLOTZ

The Diagnosis and Treatment of Diseases of the Heart. By Henry A. Christian, M D.

(Reprinted from Oxford Monographs on Diagnosis and Treatment). Octavo of 599 pages. New York, Oxford University Press, 1940. Cloth, \$7.00.

This excellent book treats of all the common and many uncommon affections of the heart. It stresses the bedside observation of the patient and assigns to their proper perspective laboratory procedures, recognizing their value but showing that they do not give the final answer, as they supply only part of the whole picture. Before adequate therapy can be instituted a proper diagnosis is essential, and the book adopts this premise throughout. It represents the results of the author's experience in his many years of hospital practice, and all views put forth are founded on critical analysis. On disputed points a common-sense attitude is adopted, and conclusions are based on sound reasoning. Although no effort has been made to review the whole literature on various disorders, the references are pertinent and up to date. The practicing physician will find this a valuable book, as it represents a splendid clinical review of diseases of the heart.

J HAMILTON CRAWFORD

Bacillary and Rickettsial Infections. Acute and Chronic. A Textbook. Black Death to White Plague. By William H. Holmes. Octavo of 676 pages. New York, Macmillan Company, 1940. Cloth, \$6.00.

This book on bacillary and rickettsial infections does not follow the conventional form of presentation. The author describes not only the clinical manifestations of the diseases but also their historical relationship to contemporary civilization. The advantages of such a treatise from the cultural standpoint are definite. Moreover, the treatise leads to a more true understanding and appreciation of the problems that have been solved, as well as those for which a solution is sought.

The volume is divided into eight sections and comprises thirty-four chapters. In the first section the author describes the Pasteurella infections of plague and tularemia, in the second the rickettsial infections of man including the various forms of typhus fever. The third portion is devoted to Brucella infections and the fourth to the enteric group of diseases. In the fifth section the more important bacillary infections and intoxications are described, including diphtheria, botulism, tetanus, and gas gangrene. The last three sections of the book are devoted, respectively, to the hemophilus infections, the mycobacterial diseases, and miscellaneous bacillary diseases such as anthrax and glanders.

The references that the author gives are those that he has actually consulted himself, and they are sufficiently modern. In many places Dr Holmes discusses controversial points, and the position he takes appears, in general, to be a logical one based on careful scientific reasoning and on available information. This important book is modern in content and is rich in subject matter, with a unique and interesting form of presentation in which the classical and historical aspects of the subject receive suitable emphasis. It is a contribution of value.

Editorial

Medical Student Training

The medical student training problem must be honestly faced—now. There is no possible excuse for intellectual unpreparedness. The health of the people is the strength of the Nation. And that health can be conserved, maintained, and bettered only by the medical profession and its work. Neither politicians, nor legislators, armies, demagogues, lawyers, bureaucrats, statisticians, accountants, labor unions, or machinists can do this—but only physicians. This is the fact, this is the truth, this is the inescapable reality from which there can be no flight.

You will never see a synthetic doctor, an "ersatz" physician, or a "blitz-educated" surgeon! You will never see doctors of public health, research physicians, or pathologists come rolling off an assembly line! For—mark this well—physicians, real physicians, the family doctor, the specialist, the doctor, the only doctor who is entitled to write M.D. after his name, is only a medical student, a medical student with more experience, an experienced medical student with a license to practice, a licensed, experienced medical student who practices his profession while he continues to study.

Time. Time "is of the essence of the contract." Time for study, time for experience, time for practice, time to train and discipline physicians, those who have the earned right to write M.D. after their names, so that they shall be competent by actual trial and proof to preserve,

maintain, and better the health of the people, that health which is the strength of the Nation; that health which only physicians can preserve.

War! War in Europe! Preparedness here!! Now, this minute. This year. For many years. Physicians. Physicians! Physicians!! Surgeons. Pathologists. Epidemiologists. Doctors of Public Health. Ophthalmologists. Neurologists. Psychiatrists. Radiologists. Bacteriologists. Army doctors. Navy doctors. U.S. Public Health doctors. Doctors for Defense! Doctors wanted for defense!!

Doctors are only medical students with experience. Medical students. Medical schools. Graduates in medicine. How many do we have? Here in the United States? Approved medical schools graduate yearly 5,000 medical students, students yet without experience, without hospital training, without experience in practice. Five thousand doctors of medicine, men and women, educated but not yet fully disciplined or experienced.

War! Death!! What is the death rate among United States physicians who are responsible for the lowest civilian death rate ever known in this Nation? Every year 3,800 to 4,000 physicians die and their skill and their experience die with them. In peace time they die at this rate. In war time, faster.

Faster. faster. hurry. more physicians! Physicians for defense. Physicians for Britain! April 20, 1941. "Roosevelt Asks 1,000 Doctors to Vol-

What is the Physicians' Home?

The Physicians' Home is not an academic experiment. It is a reality. It concerns itself with the future and old age of human beings,—members of our profession. The Physicians' Home provides a home and maintains comfortable standards of living for its guests.

The validity of our worthy charity is not to be looked for in stone, but in the actual benefits now utilized by members of our own profession. It is a challenge to all of us to accept the responsibility for helping those less fortunate than ourselves. *Please cooperate*

MAKE CHECKS PAYABLE TO

PHYSICIANS' HOME • 52 East 66th St., N. Y. C.

Such a program needs physicians!

Because a healthy population is the indispensable foundation of national and social security

Such a program demands the truth, there is no time to spare for quibbling and indirection, verbal fencing, now is the time for plain, unvarnished truth

In his message to Congress on the state of the Union, January 6, 1941, the President said that this was "no time to stop thinking about the social and economic problems" of the nation. We agree with him in principle. This Society is even now sponsoring a radio program every week on station WMCA in which, relative to those social and economic problems we show how the doctor is involved in every step of the present training program in housing, in feeding, in physical hardening, in adaptation to climatic changes, in relaxation, in recreation, in mental and physical hygiene. We show the current arrangements for treating illnesses and disabilities. We show the preventive phases of the doctor's work in both civilian and military life.

The defense program demands the truth! It is the only acceptable and workable foundation for mutual understanding and unimpaired efficiency. "There is a place for government in medicine. It is the place of government to govern, to decide the rules under which the game shall be played. *It is not the place of government to make the rules, play the game, and to umpire all at the same time, and besides to make the people pay—and most often pay excessively—for participating in the spectacle*"¹ Think about that. Now is the time. Time for what? To keep thinking about the social and economic problems of the nation.

About the economic problems especially. About taxes, for instance. Hidden taxes translated into terms of average families in the various income groups.

A recent survey² shows that "the lowest income group (\$1,250-\$1,500, average \$1,364) spends \$3 00 a year in direct taxes, but pays an additional \$204 in *hidden levies*. This brings about the following *reductions in standard of living*: Food, from \$487 to \$449. Clothing, from \$123 to \$111. Shelter, from \$427 to \$320. Automobile, from \$93 to \$73. Welfare, from \$142 to \$128. Comforts, from \$89 to \$80.

"In the middle groups (between \$3,000-\$4,000, average \$3,394) direct taxes take only \$13, but an additional \$447 comes out painlessly. Hidden taxes bring about the following *reductions in purchasing power*: Food, from \$770 to \$680. Automobile, from \$289 to \$228. Welfare, from \$824 to \$742. Comforts, from \$276 to \$247. The tax collector, it appears, is quicker than the eye."

So much for hidden taxes. The welfare item includes savings, commuting, medical and educational costs and represents about 10 per cent in *hidden taxes*. Medical costs—hidden taxes—who pays them in lowered standards of living? Now is the time to tell the people the truth, all of the truth, about doctors in medicine, about government's place in medicine, about hidden taxes and standards of living, about medical education and the preparedness program, about the cost of "free," tax-paid, or "state" medicine for which both sick and well people in the end will have to pay either in direct or hidden taxes. The care and feeding of government is the direct concern of the tax collector.

unteer to Go to Britain."

Headlines Editorials "Already there is heard from public hospitals and other charitable institutions the cry of alarm that there is a growing shortage of nurses and interns. Only recently was that declaration made public."* The British Red Cross has appealed, through the American Red Cross, for as many as 1,000 young American doctors to help meet "an acute shortage" of physicians in British hospitals. "As President of the American Red Cross," Mr. Roosevelt said, "I heartily approve this request."

Doctors for defense Doctors for the military services Doctors for Britain Doctors, more doctors. How many are there? In the United States and its possessions, how many are there? 180,075 licensed to practice, 27,000 of them 65 years old or older, 153,075 under 65 years to care for a population of 130,000,000, to service an army under present plans for training of 1,400,000 men.

Reserves The Medical Reserve Corps. How many? 13,500 of whom about 75 per cent are fit for active duty, active military service. Young men. How many new graduates (women and men) are fit for active military service? About 60 per cent of the 5,000 annual graduates, or 3,000 young men not yet thoroughly disciplined or trained, lacking experience.

Requirements The military services

require about five times as many physicians per 1,000 men as are needed in civilian practice. Industry needs physicians. Communities must not be deprived of proper medical supervision and service. The Gallup poll** answered the question "Should students studying to be doctors and engineers be permitted to finish their present training course before being drafted into the Army?" Yes 87 per cent, No 13 per cent.

Facts Local draft boards have the power to decide the question of deferments of individual cases on their specific merits. Local draft boards are composed of the people who answered the Gallup poll. There should be little fear of interference with medical student training under these circumstances. The American Medical Association has wholeheartedly approved the President's call for 1,000 physicians to volunteer for aid to Great Britain. There will be no shortage of physicians, men entitled to write M.D. after their names, either for the Nation's defense, or the training program, or for the maintenance of health in industry and in the communities of the United States, *if the medical student training program of American medical schools is uninterrupted*.

* *Citizen-Register* Obituary N.Y. April 15 1941 p. 4
** N.Y. Times April 17 1941

Now Is the Time.

Time for what? Well, among other things, "for all good doctors to come to the aid of their nation. They can aid their country and protect the interests of the people by once more occupying a prominent place in the civic and political life of the community."¹ The physician today is *professionally* "an integral, indispensable factor in the activities by which Americans keep alive, activities by which Americans learn, make a living, and amuse themselves, activities by which Americans are today preparing to defend their land and their way of life."

"There is war in the world today. We in this country, in this century, have learned and come to accept the proposition that no man is alone."² The nation needs its physicians in every aspect of national defense and in every aspect of civil life that supports and makes possible this defense program.

Such a program needs billions of dollars, some for materials, *most for labor, wages*.

Dr Samuel Joseph Kopetzky

Samuel Joseph Kopetzky, M.D., was born in New York City, August 1, 1876. He was educated in the public schools and attended the College of the City of New York. He received his doctor's degree at the College of Physicians and Surgeons, Columbia University, New York, in 1898.

He became instructor, diseases of the ear, New York Post-Graduate Medical School and Hospital in 1905, was clinical assistant, then assistant surgeon, and finally junior surgeon at the Manhattan Eye, Ear, Nose and Throat Hospital in the division of otology where he remained until 1917. He has been professor of otology, New York Polyclinic Medical School and Hospital, and director, department of otolaryngology, at that institution from 1939 to the present time.

Dr Kopetzky is also director of otolaryngology, Israel-Zion Hospital, Brooklyn, consulting otolaryngologist, Beth Israel Hospital, New York City, Nyack Hospital, Nyack, New York, Newark Beth Israel Hospital, Newark, New Jersey, Vassar Brothers Hospital, Poughkeepsie, New York, and to Jamaica Hospital, Jamaica, Long Island.

He is a fellow of the American Medical Association, The New York Academy of Medicine, the American College of Surgeons, the American Academy of Ophthalmology and Otolaryngology, past-president, Medical Society, County of New York, 1925, past-president, American Laryngological, Rhinological and Otolological Society, 1938, chairman, Committee on Scientific Work, Medical Society, State of New York, 1926-1927, chairman, Special Committee on Publicity, Medical Society, County of New York, 1931-1940, speaker, House of Delegates, Medical Society of the State of New York, 1933-1938, chairman, Section of Otolaryngology, The New York Academy of Medicine, 1933, editor, *New York Medical Week*, official organ of the Medical Society of the County of New York, 1923-1940, member, Editorial Staff (literary chairman), *NEW YORK STATE JOURNAL OF MEDICINE*, 1935-1940, chairman, Committee on Medical Preparedness, Medical Society, State of New York, 1940-1941.

Dr Kopetzky served in volunteer infantry, Spanish-American War, served in World War, entering the U S Army as a captain, Medical Corps, 1917, was successively promoted to ranks of major, lieutenant-colonel, and, finally, colonel. He served in France with the 81st Division, and was cited for gallantry after the Argonne-Meuse offensive. He was awarded the Conspicuous Service Cross for overseas service by the State of New York. At present he holds the rank of colonel in the Medical Corps. Dr Kopetzky was ordered to active duty last September as director, Medical Division, Selective Service Administration, New York City area.

Dr Kopetzky has served the Society as president-elect during the last year in a time of much difficulty and stress owing to the first peace-time training under the Selective Service Act.

SAMUEL J KOPETZKY, M D

THE NEUROSURGICAL APPROACH TO EPILEPSY

JOHN E. SCARFF, M.D., New York City

FOR many years the patient who suffered with convulsions was branded as an "epileptic" and was abandoned to a life of ostracism and despair. Today, however, we have a different point of view. We regard convulsions not as a disease but merely as a symptom or sign which may be produced by any one of a number of different diseases. Today we look upon convulsions in much the same way as we look upon fever, pain, nausea, or failing vision—simply as a clinical symptom.

A convulsion indicates either a pathologically irritable brain, or else a pathologically irritated brain. The etiologic factors capable of contributing to either of these two states are numerous and diverse.

Etiologic Factors

The pathologic factors producing convulsions may be (a) diffuse or (b) discrete.

(A) *Diffuse Pathologic Processes*—Those processes that tend to make the brain as a whole more irritable—or as we say "have a lower threshold of excitability"—are apt to be diffuse. If anatomic (structural), they are illusive and often cannot be demonstrated. In many instances they may be essentially physiologic (chemical). In either event it seems probable that the primary etiologic factor in the so-called epileptic brain is a congenital and constitutional defect.

Various secondary mechanisms, however, may operate in different individuals to "release" the convulsions. For instance, in the convulsions that frequently usher in acute infectious illnesses of childhood, "the release mechanism" might be simply the hyperpyrexia of the child's body, or it might be the toxins elaborated by the invading organisms. The convulsions accompanying uremic poisoning are apparently released as a result of the abnormally high concentration of nitrogenous waste products in the blood stream, which would normally have been eliminated by the kidneys. The convulsions of eclampsia are due to a still different release mechanism.

Various biochemical mechanisms may have an influence on the incidence and severity of

convulsions in a person who is already constitutionally inclined to have such attacks. It has been found with some patients that an unfavorable water balance or acid-base balance within the body will affect the incidence and severity of convulsions. We know, too, that hypoglycemia (hyperinsulinism) occasionally induces epileptiform seizures.

Other speculative causes of convulsions or their release mechanisms would include dietary and vitamin deficiencies and allergy. Since the Na-ion concentration of the body fluids has been shown to be a marked secondary factor in producing the violent paroxysmal irritation of the inner ear characteristic of Ménière's syndrome, it is altogether possible that abnormal concentrations or deficiencies of this or other ions in the body fluids might form a release mechanism for convulsive disorders. These are aspects of the questions which merit further study.

(B) *Localized Pathologic Processes*—Pathologic processes that cause irritation of a brain constitutionally normal are apt to be discrete, localizable lesions usually, though not invariably, grossly anatomic in nature. They may be (1) developmental anomalies, (2) vascular anomalies, (3) inflammatory and postinflammatory processes (these include cerebral abscess, postmeningitic adhesions, tuberculomas, and syphilomas), (4) traumatic sequelae, such as depressed fractures of the skull, cortical cicatrices, and hematomas, (5) neoplasms—probably the most common cause of convulsions arising in adults.

In addition to these strictly anatomic lesions, however, there would appear to be other focal lesions that are essentially or completely physiologic. Electroencephalographic studies made upon persons suffering from convulsive disorders frequently reveal sharply localized areas of the brain from which emanate electrical discharges. Similar observations have been made directly upon the exposed brain at the operating table. It is reasonable to believe that these areas represent points on the cortex of the epileptic brain from which convulsions are released.

Again, when the exposed human cortex is stimulated electrically at the operating table with a mild current, sharply focal responses are, as a rule, obtained, for instance, by stimulating an appropriate area, one finger may be made to flex or one side of the face to

The Surgery of Deafness

There probably is no more spectacular branch of surgery for the restoration of sensory function than that which deals with the improvement of hearing acuity in the deafened. The so-called simple mastoidectomy, which Whiting alluded to as one of the prime life-saving measures, had its origin in the efforts of surgeons to discover a cure for hardness of hearing. This, failing in its original intent even though it succeeded in eliminating threats to intracranial invasion, stimulated many otologists to seek a remedy for certain forms of deafness by attacking surgically the impaired channels to the receptive mechanism in the cochlea. Many outstanding otologists have delved seriously into this problem—Passow, Bárány, Fremel, Alderton, Jenkins. In recent years, Holmgren, Sourdille, Lempert, Campbell, and Kopetzky have interested themselves in the possibilities of surgical therapy for the deafened.

The lay press has been so full of promising results that surgery, patterned after Holmgren and Sourdille, might bring in its train that the sober résumé of Kopetzky¹ at the annual meeting of the American College of Surgeons adds freshness and clarification to this issue. He states that "the greatest possible care

¹ Kopetzky, S. J. Surg., Gynec. and Obst. 72: 466 (Feb. 15) 1941.

must be exercised, in making promises of what will be accomplished by these operations." He ventures that there is promise in the evolution of surgical therapy for the deafened, but at the present time every possible safeguard and caution should be exercised. While good results are on record, the type of case which will react best to labyrinthine fenestration remains unclarified. At present it is impossible to make a definite estimate of its value to an individual patient as a means of restoring hearing. While new vistas of research have been opened, the paucity of knowledge concerning the physiology of hearing has also been brought to the fore.

Physicians who may be consulted by their deafened patients concerning this surgery should be aware of the limitations that now exist. Kopetzky states "Many troublesome, annoying experiences will be avoided if not only the patient but his family are told exactly what this surgery holds out for him and that it is impossible truthfully to predict results on hearing acuity." The recorded data show to date that some patients in whom the surgery has been successful and in whom the audiogram indicates a sustained gain in hearing acuity are, nevertheless, dissatisfied because they *still are hard of hearing*.

Hyperinsulinism

The clinical syndromes arising from overactivity of the thyroid, pituitary, and adrenal glands have been meticulously described and are readily recognizable upon examination. The physician, however, rarely considers that it is just as possible for the islands of Langerhans to secrete more insulin than the body normally requires. And thus may be produced the disease that Harris¹ alludes to as "hunger disease."

Over eight years ago, Harris called attention to the correlation of low blood sugar levels with vague spells of nervousness, weakness, and abdominal discomfort. These symptoms, sometimes accompanied by unconsciousness and convulsions, occur between meals or during a meal before the food has been sufficiently absorbed to raise the level of the blood sugar. The patient will state that several pieces of candy, orange juice, or some other sweet gives him relief, and that he can diminish the severity of the attacks in this manner. This history, because of its close

similarity to the complaints of many hysterics, may erroneously lead to a diagnosis of psychoneurosis.

An eight-hour sugar-tolerance test, during which time the patient should engage in his usual activities, assures an accurate diagnosis. Blood collected when the symptoms are most acute will reveal a low sugar content. The therapeutic test, wherein rest, coupled with a low carbohydrate diet and hourly drinks of fruit juices, alleviates the symptoms, is almost diagnostic of hyperinsulinism.

In the mild and moderately severe cases, Harris has obtained relief of symptoms by dietary measures. Restriction of activity, dividing the daily requirement of food into five to seven feedings, with fruit juice between meals, is the regimen he advocates. Severe cases require the administration of glucose intravenously or, where a new growth of the pancreas is suspected, exploratory surgery and partial resection when necessary. Of prime interest, however, is the clinical recognition of the syndrome of hyperinsulinism.

¹ Harris, S. South Med & Surg 102: 687 (1940).

duced by a localized lesion that could be removed surgically

All the available sources of focal data should be painstakingly examined in every case of epilepsy. Focalizing features of great importance but not at first apparent may many times be brought to light by various diagnostic studies. These may, for convenience, be divided into (a) minor diagnostic studies and procedures and (b) major diagnostic procedures.

(A) *Minor Diagnostic Studies and Procedures*—1 The age of the patient at the time that the convulsions first appeared is of prime importance. Convulsions beginning after the age of 25 or 30 are almost invariably due to a focal lesion, often to tumor.

2 The early convulsions occurring in the initial stages of a long-standing case of epilepsy, which now shows only generalized major convulsions, are sometimes found upon careful questioning definitely to have been focal in character.

3 Abortive or incomplete attacks, in which only the early part of the convulsive pattern is acted out and the "fit" is arrested spontaneously before becoming generalized, often yield valuable focalizing information that is altogether lacking in the more serious generalized attacks. For instance, a patient who suffers currently with two or three attacks of generalized convulsions a month may experience, from time to time between these attacks, a transient stiffening of the fingers of one hand, a feeling of heaviness in one leg, or a difficulty in expressing himself as fluently as usual.

4 The auras or warnings that often immediately precede generalized convulsions are occasionally of value in establishing the focal nature of epilepsy, especially if the auras present a pattern that is constant in recurrence. For example, bright lights referred constantly to the right-hand fields of vision of both eyes just before a convulsion might well indicate an irritative lesion in the left temporal or occipital lobe.

5 The initiating phase in any given attack may also give leads that will help to lateralize or even localize a lesion. Sometimes this will be purely sensory, such as a feeling of "thickness" on one side of the tongue, a "warm" feeling passing down an arm, or a "heavy" feeling in the leg, followed almost immediately by loss of consciousness and a bilateral, nonfocalizing convulsion. Occasionally, the first movement in a truly generalized convulsion may repeatedly and

consistently be a stiffening of one leg, a raising of one arm, a turning of the head always to one side, or a twitching of one side of the face. These may occur just as the patient is losing consciousness or even after he is unconscious and may precede the general fit by only a fleeting second. They could not properly be called "jacksonian" phenomena, but, if they constantly initiate the convulsive pattern, they probably have definite relationship to a "trigger area" in the brain. Even the simple observation that convulsions always begin on one side of the body may be of great value in locating a lesion.

6 Postconvulsive sequelae or residual symptoms and signs remaining even a short time after the attack itself has passed may give true focal data. For example, following complete return of consciousness, a patient may, for several hours or days, drag one foot in walking or have a conspicuous difficulty in speaking, although mentally quite clear—signs present at no other time.

7 Other symptoms or signs referable to the central nervous system found in association with convulsions should automatically raise the suspicion of a focal lesion. Headache, nausea, blurring vision, weakness, numbness of an extremity, or changes of personality exhibited in a patient having epileptic attacks would constitute strong presumptive evidence that an expanding lesion, such as tumor or abscess, was producing the seizures. All effort should be made to establish the existence of such a lesion—if necessary, by air studies.

8 Active pathologic processes elsewhere in the body, such as pulmonary abscess, tuberculosis, syphilis, or any neoplastic disease in a patient suffering with convulsions, should always raise the suspicion of a metastatic lesion of the same type in the brain.

9 Trauma preceding the onset of epilepsy offers presumptive evidence of localized scar tissue or adhesions of the brain, even though the convulsions themselves are generalized and without focal features. This is so because the scar tissue may be present in "silent" areas, such as the frontal lobe, taken up only with the higher psychic functions from which release of sharply localized motor or sensory phenomena is impossible.

10 The neurologic examination may show evidences of a localized pathologic process. In addition to the more common signs, such as focal weaknesses and reflex changes, lesser findings, such as suppression of automatic associated movements or focal atrophies, may

contract When such mild stimulation, however, is applied to a certain area of the brain in certain epileptic patients, instead of a focal response being obtained, this mild stimulation sets off a major epileptic attack identical with those experienced by the patient clinically. Such a point in the brain, which we term a "trigger area," may well be looked upon as an epileptic focus and treated in the same way that an anatomic focus is treated.

Clinical Forms

Clinically, convulsions may be (a) generalized or (b) focal.

(A) *Generalized convulsions* are those that involve all parts of the body simultaneously and equally. They may be "grand mal" seizures in which the patient loses consciousness, falls to the ground, bites his tongue, becomes incontinent of urine and feces, and all parts of his body become involved in violent clonic convulsive movements. On the other hand, the attacks may be the so-called "petit mal" seizures, characterized only by fleeting lapses of consciousness, oftentimes scarcely perceptible. In either case the widespread or diffuse clinical manifestations suggest widespread diffuse pathologic processes within the brain, either anatomic or physiologic. In those cases in which this has been proved to be true, the treatment must come from the medical therapist rather than from the surgeon.

Unfortunately, the problems of etiology and therapy to be solved in these cases of generalized convulsions are more complicated and obscure than those presented by the so-called focal epilepsy to be discussed in the following paragraphs, and, as a matter of fact, are often very little or not at all understood at the present time. For this reason they are too often regarded as "idiopathic" and even as "congenital," without a proper search for the etiologic factor ever having been made.

The term "idiopathic" should, in fact, be used reluctantly and with the thought that it refers not so much to etiology undeterminable as to etiology not yet determined. At present there is afoot a real renaissance of interests in the etiology and mechanism of the epilepsies, and it seems probable that as study continues many of the general convulsions that now appear to be "idiopathic" will be found to have specific clinical syndromes based on constant pathologic factors which can be determined and successfully treated by specific therapy.

(B) *Focal convulsions* are those that pri-

marily involve, or are completely limited to, a certain sharply localized part of the body. As a rule they are produced by one of the discrete focal pathologic processes described in the preceding section of this paper. It is reasonably assumed that if the original focus of irritation be found and eradicated in these cases of focal convulsions the attacks themselves will cease. From this it may be seen that cases of focal epilepsy are essentially surgical problems.

While focal convulsions are practically never produced by generalized pathologic processes, the reverse does not hold true. It cannot be emphasized too strongly that *generalized convulsions may be, and frequently are, produced by exquisitely focal lesions*. A good example of this would be the convulsions produced by brain tumors.

This leads up to the essential diagnostic problem in cases of convulsive disorder.

The Diagnostic Problem—Methods of Study

The essential diagnostic problem in any given case of convulsive disorder is to determine whether the convulsion is the result of a diffuse pathologic process causing a generally irritable brain, or whether it is caused by a focal pathologic process. The former presents a strictly medical problem, whereas the latter may, in many instances, be treated successfully only with surgery.

Focal convulsions are indisputable evidence of a discrete, localized, irritative lesion of the brain. The classic example is the so-called "jacksonian" fit. Here, for instance, clonic movements first appear in the digits of one hand and pass slowly up the arm, involving progressively the wrist, elbow, shoulder, face, trunk and leg of the same side, and, finally, the entire body in a generalized clonic convulsion accompanied by loss of consciousness and incontinence of the sphincters. With such a convulsion the diagnosis of focal epilepsy due to a focal lesion is easily established.

General convulsions, however, do not rule out a focal lesion. Indeed, generalized convulsions are frequently produced by the most sharply localized lesions, as, for example, brain tumors. Particularly is this true in the later stages of the tumor growth when the entire brain has been indirectly involved and is abnormally irritable. A person observing only a convulsive seizure in such a patient might see no evidence whatever, from the character of the attack itself, that it was pro-

directly from the exposed cortex. The abnormal and characteristic waves obtained in typical cases may permit precise localization of the epileptic focus. This, of course, is of extreme value in those cases where there is no gross change in the appearance of the brain (Figs 1a and 1b).

17 Electrical stimulation of the exposed cortex in search of a "trigger area." In a systematic way, stimulation of the exposed cortex is carried out, using a fine bipolar electrode and minimal current—galvanic or faradic. As the investigator stimulates point after point along the various gyri, sharply focalized responses, such as the movement of a single finger, are normally obtained. But if a spot is found which is a so-called "trigger area" for convulsions, its stimulation, even with a weak current, causes a violent convulsion and in typical cases reproduces the exact pattern of the epileptic fit from which the patient seeks relief. Excision of this "trigger zone" should terminate the attacks in favorable cases.

The diagnosis of "idiopathic epilepsy" is permissible only when (1) the disease first appears during infancy or early childhood and (2) when no evidence of a specific or focalized etiology can be obtained by any of the methods of study outlined above. Even then the diagnosis should be considered tentative. It should be made with hesitation and with the same amount of mental reservation as would accompany a diagnosis of "fever—unexplained," for it is unquestionably true that, as a result of improved methods of study and a revival of interest in the subject, many cases of epilepsy that would have been regarded as "idiopathic" (and hence incurable) twenty years ago are today being shown to be the result of a localized, specific lesion for which surgery offers a favorable prognosis.

Treatment

Theoretically, all generalized nonfocal epilepsy should be treated by medical measures calculated to reduce the irritability of the brain or raise its threshold to irritable stimuli, and all focal epilepsy should be treated by the ablation of the lesion causing the irritation of the brain.

In practice, however, this idealized program is not rigidly adhered to in all instances. It would be unwise, for example, to subject a patient to a major surgical procedure for the relief of convulsions that were mild (those that occurred infrequently, possibly only while the

patient was asleep, and did not in any way interfere with the patient's social or economic life) simply because the attacks had focal features.

All patients suffering with convulsive disorders, however, should be admitted to a neurologic hospital and should be thoroughly investigated along the lines laid down in the preceding sections of this paper under the designation "Minor Diagnostic Procedures." This study should certainly include an electroencephalogram and a pneumoencephalogram. At the completion of these studies, concluding with the pneumoencephalogram, it is possible to divide the patients into three categories:

1 Cases that show no focal or lateralizing symptoms or signs of any sort. These cases must be considered for the time being as nonfocal and, hence, nonsurgical. They can only be treated by one or another of the medical types of therapy to be outlined later.

2 Cases that show gross anatomic lesions in the brain by clinical examination or pneumoencephalography. This group would include depressed fractures, post-traumatic cicatrices with deformity of the ventricular system, and tumors. These cases are unquestionably surgical problems. The tumors offer absolute surgical mandates. The depressed fractures should be elevated to prevent degeneration, with formation of a cicatrix in the underlying brain. And the scars already present should be removed to stop the severe, persistent, and probably destructive irritation to adjacent brain.

3 An "intermediate" group remains showing evidences of focal lesions which are irritative but not grossly anatomic—in which, in other words, there is no compression or distortion of the brain as revealed by pneumoencephalography. The writer feels that all members of this group should be given a thorough trial under medical therapy before any surgical measures are contemplated. Surgery should only be carried out in this group when all medical measures have failed.

(A) *Medical Treatment*—The medical treatment of convulsive disorders consists primarily in the use of anticonvulsive drugs, supplemented by general hygienic and dietary measures. The bromides were first used as specific anticonvulsives in 1858 by Lacocq, and for many years they were the only drugs known to be available for this purpose. In 1912 Hauptman introduced phenobarbital, known generally as "luminal," which was decidedly more potent than bromides had

FIG 1a

FIG 1b

Fig 1a Showing technic employed in studying the electrocortical potentials of the brain in a search for epileptic focus. The bipolar electrodes can be adjusted to rest lightly against any portion of the cortex.

Fig 1b The graphs show the type of record obtained. (A) Represents essentially normal "brain waves." (B) Shows pathologic waves of slow frequency indicating the presence of a pathologic lesion in the region from which these potentials were obtained. (C and D) Show large slow waves similar to those seen in (B). In addition, there are seen some "spike formations" frequently found in association with convulsive disorders, especially petit mal seizures.

have significance in localizing the etiologic lesion.

11 Blood chemistry should be tested, although spontaneous hypoglycemia (hyperinsulinism) is an extremely rare cause of epileptiform seizures.

12 Roentgen-ray examination often establishes the presence of a focal lesion by showing depressed fractures or by revealing erosions, hyperostoses, or vascular anomalies of the bone. Calcific deposits within the brain itself may indicate the presence of a tumor.

13 Electroencephalography is a recent development whereby minute changes in electric potentials generated by the brain can be recorded and studied. The currents are taken directly through the intact skull by means of small electrodes fastened by collodion to the scalp. It has been found that areas initiating epileptic fits give off abnormal and characteristic waves that are quite different from the waves given off from other normal areas of the brain. This new technic offers promise of great advance in the localization of epileptogenic foci (Fig 1).

14 Pneumoencephalography. A study of epilepsy is rarely complete without an encephalogram or ventriculogram. These are special forms of roentgen-ray study in which the spinal fluid is removed from the ventricles and subarachnoid spaces of the brain and is replaced by air or other gas that shows in

great contrast to the brain itself in roentgen-ray pictures.

These frequently reveal distended or distorted ventricles or abnormalities of the subarachnoid spaces which undeniably establish the site and nature of the pathologic process accountable for the convulsions when all other methods of study have failed. For example, an encephalogram or ventriculogram may be the only way possible to discover, and accurately locate, a congenital porencephalic cyst in an infant having convulsions where the condition would otherwise be regarded as a case of congenital "idiopathic" epilepsy. In the same way encephalograms or ventriculograms often reveal tumors in adults which could not otherwise be diagnosed.

(B) *Major Diagnostic Procedures*—15 Craniotomy with visual inspection of the cortex. This may reveal flat surface lesions that are not revealed by pneumoencephalography. These include adhesions involving the cortex, pia-arachnoid, and dura, and also arteriovenous anomalies of surface vessels. Both of these lesions are frequent causes of convulsive disorders. They do not have sufficient bulk to cast a shadow in the pneumoencephalogram or to distort the ventricular system. In most instances, the only way of confirming their presence is by direct inspection of the surface of the brain.

16 *Electrocorticograms*. These are studies of electrical brain potentials taken

FIG 3 CASE 1 (continued) (A) Note the depressed and retracted scar of cortex which underlay the depressed fracture at the anterior pole of the frontal lobe (indicated by arrows) Markers 1, 2, 3 indicate the primary motor (precentral) convolution. (B) Same area following amputation of anterior pole of frontal lobe containing the scar The patient has had no convulsions since operation

tolerate an occasional attack with little emotional reaction. On the other hand, a highly sensitive, cultivated person undergoes intense mental suffering with each such attack, and many people develop unsocial and psychopathic personalities due to the frustration and shame associated in their minds with the disease. It is obvious, therefore, that no general rule as to when or when not to operate will hold true in all cases, and each case must be decided individually.

Surgery is indicated, in general, if (1) the attacks are socially or economically incapacitating, (2) they are in any way focal, and (3) medical therapy has proved unsuccessful in controlling them.

If surgery is decided upon, then a large craniotomy should be performed, which will allow the major diagnostic procedures above described to be freely carried out, viz (1) visual inspection of the cortex for adhesions or vascular anomalies, (2) study of cortical potentials, and (3) electrical stimulation of the exposed cortex in search of a so-called "trigger area." Should an epileptogenic focus be discovered by any of these three means, it should then be treated in the manner best suited to the individual situation. This will be determined in each instance by the nature of the lesion and its position.

Results

The postoperative results permit certain generalizations to be made.

In the first place, the more definitely and grossly anatomic the focal lesion that causes the convulsion is, the more successful, as a rule, is the result following its removal. For

instance, the group comprising the depressed fractures and the cortical cicatrices sufficient to produce changes visible in the pneumoencephalogram has a high percentage of complete and permanent cure. The convulsions due to tumors almost completely disappear upon the removal of the offending growth. The 1 patient in my series of cases with a localized venous angioma of the cortex, which was removed "en bloc," has had no convulsions for the two years since the operation.

Few patients in whom the focal lesion was essentially physiologic rather than anatomic have been completely cured of their seizures as a result of operative measures. On the whole, however, they have shown varying degrees of improvement, and 2 such cases have been strikingly successful. Most of the patients themselves feel that they have been definitely benefited and are grateful. In connection with this group it should be remembered that the basic cause of the convulsions in all of these patients is probably a constitutionally low threshold for all forms of irritation and that the various focal points found and treated at operation probably represent simply the secondary "release mechanisms."

Case Reports

Space will not permit, nor is this the occasion for, a statistical analysis of operative results. Thus the author hopes to make in detailed form in subsequent reports. A few cases illustrative of the principal types treated by surgical measures, however, follow.

Case 1—V L, woman, aged 23 Depressed fracture right frontal bone in infancy Generalized

FIG 2 CASE 1 Generalized convulsions following depressed fracture of right frontal bone. The arrow indicates fracture. Note also how the cortical cicatrix developing beneath the fracture is pulling the anterior pole of the right lateral ventricle forward.

been and caused less unpleasant reaction. In 1938 Dr. Tracy Putnam, formerly of Boston and now director of the Neurological Institute of New York City, and Dr. Houston Merritt, of Boston, brought out an entirely new drug—sodium diphenyl hydantoinate—generally referred to now as “dilanitin,” which has proved phenomenally successful as an anticonvulsive and marks a further great advance in the medical treatment of convulsive disorders. It is estimated that 60 per cent of patients suffering with convulsive disorders were completely or greatly relieved by the use of luminal and that an additional 60 per cent of those unaided by luminal have been cured or greatly benefited by the drug, “dilanitin.”

The ketogenic, the high-protein, the low-salt, and the low-fluid diets have all benefited certain patients from time to time and should certainly be given a trial, as indicated, in association with the more powerful pharmaceutical agents.

(B) *Surgical Treatment*—In spite of the most intensive and best directed medical care, a certain number of patients of the “intermediate” group will continue to have convulsions.

The selection from this group of those patients who should undergo surgical exploration and the major diagnostic procedures outlined above is one that depends on many variable factors different in each individual case. The frequency of the convulsions is one such factor. Obviously, if the attacks occur only once every two or three months, there is less reason for surgery than if they occur two or three times a week. Similarly, the severity of the attacks constitute a factor. Should these be accompanied by falling and serious injury, there is more reason for surgical interference than if the attacks are preceded by a warning that permits the patient to avoid injury. The time of day or night in which the attacks occur is also important. If the attacks occur while the patient is asleep, as they do in many instances, they do not interfere in any way with the patient's social or economic status. On the other hand, if they occur during the daytime, they are apt to make him a social and economic outcast.

The effect of the attacks upon the patient's ego and personality as a whole is likewise important. Many dull, phlegmatic individuals

Neurologic Examination There was a soft, irregular defect in the skull in the left parieto-occipital region which was depressed about 1½ cm. below the general level of the skull. There was slight hypoplasia, weakness, and hyperreflexia of the right arm and leg. Examination otherwise was essentially negative.

X-Ray Examination The skull showed a large bone defect in the left posterior parietal region (Fig 4). Encephalograms showed cortical atrophy in the region of the bone defect, with the atrium of the left ventricle apparently pulled toward the defect (Fig 4).

Laboratory Examinations Essentially negative.

Operation October 27, 1937—left parieto-occipital craniotomy. There was disclosed at the site of the bony defect a dense cicatrix involving dura, pia-arachnoid, and underlying brain. A "core" of tissue was removed about 2.5 to 3 cm. in diameter, extending from the dura directly down and into the ventricle, containing the cicatrix (Fig 5). The defect in the dura was closed with a piece of Cargile membrane.

Postoperative Course The immediate postoperative course was uneventful, and she was discharged from the hospital on the nineteenth postoperative day. At the time of her discharge she was receiving luminal, 1 grain three times a day. This has been gradually reduced to ½ grain three times a day.

She has had no attacks of any sort since her operation two and a half years ago. She has been working as a secretary.

Case 3—A P, man, aged 59. Tuberculoma of the left cerebrum with focal seizures. Craniotomy with excision of isolated tuberculoma. No convulsions since operation (Fig 6).

History This patient was an insurance broker, who was admitted to the hospital (New York Post-Graduate) in March, 1936, because of focal convulsions involving the right hand and arm. The first attack had occurred in November, 1933. Similar attacks had occurred in January, March, and June, 1934. From June, 1934, until March, 1935, attacks occurred every six weeks. From March, 1935, to March, 1936, attacks occurred every two weeks. An attack in February lasted two hours. Recently the right hand had come to feel "heavy." In 1927, six years before the onset of his convulsions, the patient had spent six months in a sanitarium at Saranac, New York, with a diagnosis of pulmonary tuberculosis, but he had been discharged with process apparently arrested.

Neurologic Examination Tendon reflexes were slightly exaggerated in the right upper extremity. Otherwise the neurologic examination was entirely negative.

X-Ray Examination X-rays of the skull were negative. X-rays of the lungs showed "fibroid phthisis."

Laboratory Examinations Essentially nega-

FIG 6 CASE 3 Focal convulsions caused by tuberculoma. Illustration shows midsection through block of tissue containing one small, discrete tuberculoma, removed from the post-central "thumb" area. This patient has had no convulsions since operation.

tive. Tubercular bacilli were found in the sputum. Guinea-pig inoculation was not done.

Operation February 13, 1936—left craniotomy with excision of small, single, discrete tuberculoma from the "thumb area" of the left cerebral cortex (Fig 6).

Postoperative Course The patient showed slight general reaction to the operation. There was never any evidence of meningitis. However, following the operation he did have slight transient aphasia and rather marked paresis of the fingers of the right hand. Both of these rapidly improved. At time of discharge from the hospital on the eighteenth postoperative day, the aphasia had cleared up except for a certain slowness in speech, and function had largely returned to the right hand except for finely, coordinated movements. These defects persist in minor form to the present time.

The patient has had no convulsions of any sort since his operation four years ago. He has not been taking any medication.

Case 4—K C, girl, aged 4. Venous angioma of right cerebrum with generalized convulsions. Craniotomy and block excision of angioma. No convulsions since operation (Figs 7 and 8).

History The patient was a small girl who had suffered from convulsions for fifteen months. At first these involved only the left arm and leg, but during the past month they had been generalized.

At first the attack occurred once every two to six days, but during the last month before admission they occurred two to three times a day, at intervals of one to two days. On one day she had four attacks. The patient had had no medication for her attacks.

Neurologic Examination The child was alert and active. The examination was essentially negative.

X-Ray Examination The plain films showed fine parallel linear streaks of calcification confined to the medial portion of the right parietal and occipital lobes of the brain, typical of a

FIG 4

FIG 4 CASE 2 Convulsions produced by cortical cicatrix not accompanied by depressed fracture X-rays of skull show large, longstanding, bony defect at site of original injury Ventriculogram shows the occipital horn of left lateral ventricle being pulled in the direction of the bony defect by contraction of the cortical cicatrix

FIG 5

FIG 5 CASE 2 (continued) The "core" of scar tissue extending from the dura inward to the ventricle was reamed out This patient has been free of convulsions since operation

convulsions for past three years Exploratory craniotomy disclosing dense, cortical cicatrix beneath small depressed fracture Amputation anterior pole of right frontal lobe containing cicatrix No convulsions since operation two years ago (Figs 2 and 3)

History The patient received a depressed fracture in the right frontal bone when she was a small child She recovered from the accident, but no attempt was ever made to elevate the depressed fracture Two and one-half years before her admission to the hospital in March, 1938, the patient began to have generalized convulsions without any focal features whatever These averaged about one major attack every two weeks, but at times she had had attacks each day and on one day had had as many as four attacks

The patient had received medication intermittently during this time, but there had been no consistent treatment, and no record of the quantities of medication was actually kept

Neurologic Examination Entirely negative
Laboratory Examinations Negative

X-Ray Examination Small, old, depressed fracture of the right frontal bone Encephalogram showed a mild right frontal porencephaly with a slight "wandering" of the right frontal horn toward the site of the depressed fracture (Fig 2)

Operation March 8, 1938—right frontal craniotomy under local anesthesia There was a sharp, jagged break in the inner table of the right frontal bone, and directly beneath this there was a dense, cortical cicatrix The an-

terior pole of the frontal lobe containing the cicatrix was amputated (Fig 3)

Postoperative Course The postoperative course was smooth and uncomplicated, and the patient left the hospital on the fifteenth postoperative day

Patient has had no convulsions of any sort since the operation She is regularly employed She has taken no medication since her discharge from the hospital

Case 2—I F, woman, aged 23 Posttraumatic cicatrix of left occipital lobe since age of 5 months Generalized convulsions since 16 years of age Excision of cicatrix No convulsions since operation (See Figs 4 and 5)

History The patient's birth was uncomplicated and early development normal At the age of 3 months she fell out of her carriage and struck the left parieto-occipital region She was never unconscious There was a large hematoma at the site of the trauma which eventually disappeared As time passed, the mother noticed that bone of the skull was gradually absorbed at the point of injury and never reformed

At the age of 16 years the patient had her first convulsion—a typical grand mal seizure without focal features During the next four years these occurred about once every three to six months About three or four months prior to operation there occurred an abrupt increase in the frequency of the convulsions so that these averaged three or four each week Under luminal, $\frac{1}{2}$ grain three times daily, she had one attack in two weeks The patient was left-handed

vulsions, frequently becoming generalized and uncontrolled. Two months before admission she complained of a persistent sensation of "numbness" in the left arm. On one or two occasions, transient weakness of the left leg was reported, but this cleared up.

Neurologic Examination There was slight hyperreflexia of left arm and leg and a questionable weakness of left hand and arm. Otherwise the examination was essentially negative.

X-Ray Examination Plain x-rays of the skull were negative. Pneumoencephalograms were reported negative except for slight left-sided cerebral atrophy, suggesting cerebral arteriosclerosis, most marked along the fissure of Rolando.

Operation April 8, 1938—right parietal exploratory craniotomy. A small meningioma was found, arising from the falx in the postcentral region. Complete removal was effected (Fig 9).

Postoperative Course The postoperative course was uncomplicated. She was discharged ambulatory, twelve days postoperative.

Case 6—R. G., boy, aged 8. *Convulsions since the age of 17 months. Slight weakness left arm and leg since then. Small, calcified subcortical cicatrix lying within the primary motor gyrus revealed by roentgenograms. No convulsions since operation. Return of power to left arm and leg (Figs 10 and 11).*

History The patient was a young boy suffering with convulsions. From the time he was 17 months old until he was five years old, the attacks were limited to his left hand and arm. From the age of 5 until 7 the attacks involved the entire left side of the body without loss of consciousness. During this time they usually occurred daily. Since the age of 7, the seizures have been generalized and accompanied by loss of consciousness. During this time they occurred three to four times daily, in spite of supervised luminal therapy.

FIG 9 CASE 5 The small benign tumor here pictured (meningioma) was removed from Case 5. Exploration was performed, in spite of the fact that encephalograms showed only cortical atrophy, because this patient's convulsions were so focal and constant in pattern.

Coincident with the onset of the convulsions, the parents had noted a slight left-sided paresis. This was comparatively slight and stationary, until recently, but lately had become rapidly and progressively worse.

Neurologic Examination The patient was a pale, undernourished, sickly-looking youngster who spent most of his time in bed. There was a moderately advanced, spastic left hemiparesis, with considerable atrophy of muscles and bony deformity of the left foot. The patient dragged his left foot in walking.

Electroencephalograms These revealed abnormal large, slow waves at 2 to 6 per second, together with wave-spike contours at 2 to 3 per second over the central and postcentral areas of

FIG 10 CASE 6 Focal convulsions associated with a small calcified, subcortical cicatrix. (A) Ventriculogram shows the cicatrix (arrow). Note also that the roof of the ventricle is beginning to be pulled upward by the contraction of the cicatrix. (B) Photograph of the cortex taken at operation. The numbers indicate the primary motor (precentral gyrus). Just to the left of the numbers can be seen the cortical incision through which the calcified scar was removed.

FIG 7 CASE 4 Generalized convulsions due to venous angioma of right parietal cortex. (A) Ventriculogram showing the fine parallel lines in the parietal cortex, which indicated calcification in walls of the angioma. (B) X-ray taken through the excised block of cortex containing the angioma, which shows again the parallel lines of calcification in its walls, indicated by the arrows. Note silver clips on blood vessels. (C) Photograph of the excised block of cortex containing the angioma.

FIG 8 CASE 4 (continued) This is the patient from whom the angioma shown in Fig 7 was removed. She has had no convulsions during the two years which have elapsed since her operation.

venous angioma (Fig 7A and B). Encephalograms showed the same calcification seen in the plain films but were otherwise normal.

Laboratory Examinations Essentially negative.

Operation January 27, 1938—right parietal craniotomy. The operation disclosed and the surgeon removed "en bloc" a venous angioma from the parietal lobe (Fig 7B and C).

Postoperative Course The postoperative course was smooth, and the child was discharged from the hospital on the twelfth day after her operation. At time of discharge the mother was instructed to give the child luminal, $\frac{1}{4}$ grain three times a day, but she has been careless about this, and months have gone by without the patient receiving any medication whatever.

The child has had no attack of any sort during the two years since the operation and is today completely symptom-free (Fig 8).

Case 5—M. V., woman, aged 50. Meningioma arising from the falx producing focal convulsions. Pneumoencephalogram negative for tumor. Exploratory craniotomy. Disclosure and total removal of tumor (Fig 9).

History This Italian woman had suffered for approximately two years with left-side con-

FIG 12 CASE 7 Focal convulsions involving primarily the right arm due to corticodural vascular anomaly (A) Shows the abnormal attachment of the dura to the cortex at the "arm area," as revealed at operation. (B) Shows the same view of the cortex after the abnormal attachment has been divided. There was a marked improvement after the operation

Case 8—A M B, girl, aged 14 Left-sided jacksonian convulsions from the age of 5 Generalized grand mal convulsions since the age of 7 Four or five grand mal seizures daily and twenty-five to thirty grand mal seizures each night for the past six years Exploratory craniotomy with lysis of anomalous pachionian granulation Since operation, marked improvement

History At the age of 5, this child began to have left-sided jacksonian convulsions Since 7, these have been generalized, without focal features, have increased steadily in violence and frequency From the age of 8 until 14, when she was admitted to this hospital, the patient had averaged four to five generalized grand mal convulsions, with falling and injury, each day and twenty-five to thirty similar seizures each night She has had as many as fifty-four grand mal seizures in one day During the first week after her admission to the medical wards of this institution in October, 1938, the patient averaged ten to fifteen generalized convulsions

daily Twenty-four hours before her transference to the surgical service, she went into a status epilepticus and was in this condition when operated upon

During the six years just described, the patient had been on massive doses of luminal and bromides which were administered under the personal direction of a neurologist on the staff of this hospital.

Neurologic Examination The patient was in an intermittent status epilepticus During her quiet intervals, she could be aroused from deep stupor but was unable to cooperate or answer questions intelligibly There was a slight right hyperreflexia and a slight right lower facial weakness There was a bilateral Babinski Convulsive movements seemed to start with abduction of the left arm at the shoulder and would quickly involve the entire left side and then the entire body

Laboratory Examinations Negative

X-ray Examinations There was a normal

FIG 11 CASE 6 (continued) This is the boy from whom the calcified cicatrix shown in Fig 10 was removed. Prior to operation he was suffering three to four grand mal seizures daily in spite of heavy luminal therapy. Since operation he has had no attacks.

the right cerebrum and to a lesser degree in similar position on the opposite hemisphere.

Roentgenograms. Plain films of the skull showed a small deposit of calcium about 1 cm in diameter in the right central region, about 1 to 2 cm. to the right of the midline and about 1 to 2 cm. below the surface of the cortex (Fig 10A). The pneumoencephalograms showed an outpouching of the right ventricle toward the region of the calcific deposit above referred to, which indicated that the latter was a scar.

Operation. June 10, 1939—right parietal craniotomy, primary motor gyrus incised, and subcortical, calcified cicatrix removed. By precise measurements from suture lines, as revealed in the roentgenograms, and on the skull itself a point on the surface of the brain was determined, which, it was felt, was situated directly over the calcific deposit seen in the x-rays. Electric stimulation of the cortex then revealed that the point lay directly on the primary motor gyrus in the hand area. With considerable trepidation this gyrus was incised lengthwise (Fig 10B), for a distance of 2 to 3 cm. and to a depth of 2 to 3 cm. Here the operator found a firm, irregular shaped, calcified cicatrix, which he removed (Fig 10B).

Postoperative Course. The immediate postoperative course was quite smooth, and he was discharged on the thirteenth postoperative day.

He has had no attacks of any sort during the eleven months since the operation, in spite of the fact that he has long ago stopped taking any medication.

In addition, there has been an entirely unexpected and considerable improvement in motor power and general use of his left arm and leg. His mother states that he is constantly on the go and that he is able to "lick both of his brothers either at wrestling or fighting" (Fig 11).

Case 7—A G., boy, aged 14. Corticodural vascular anomaly, arm area, left, producing at first focal, later generalized, convulsions. Marked improvement following operation (Fig 12).

History. Immediately after birth this patient had a generalized convulsion. He had another when he was 1 year old. From then until he was six, he averaged one or two generalized seizures each year. After the sixth year the convulsive movements were seen to start in the right arm and gradually became confined to the right side of the body, although they were still accompanied by loss of consciousness.

These seizures lasted three to five minutes, following which the patient would sleep for an hour or two. The attacks were usually preceded by a sensory aura affecting the right hand, and were followed, in many instances, by residual motor weakness of this member. From the age of 7 until his present admission to this hospital at the age of 14, the attacks have recurred on the average of once a week.

The patient had been receiving luminal (apparently $\frac{1}{4}$ grain twice daily) under the personal supervision of a member of our staff, for the past three months, without improvement in the frequency or severity of the attacks.

Neurologic Examination. There were a few slight signs of pyramidal tract involvement in the left arm and leg.

Laboratory Examinations. Negative.

X-ray Examination. X-rays showed a normal skull. Pneumoencephalograms showed slight cerebral hypoplasia on the left.

Operation. February 4, 1939—left craniotomy. The operation disclosed a corticodural vascular anomaly, with pachionian granulations arising from the cortical arm area (Fig 12A). This was divided and the cortex freed (Fig 12B).

Postoperative Course. Immediately following operation, the patient was placed on luminal, $\frac{1}{4}$ grain three times a day—that is $\frac{1}{4}$ grain less than his preoperative medication. From February 4, 1939, until October 5, 1939, the patient had only two attacks—one of these after he had stopped taking his luminal for three weeks. This represents an attack on the average of once in four months, as compared with the preoperative average of once every week. The patient has not answered requests to return to the clinic or letters of inquiry since February 1939.

Symposium on Urologic Disease and Hypertension

RELATION OF KIDNEY TO BLOOD PRESSURE

HERMAN O. MOSENTHAL, M D, New York City

HYPERTENSION is recognized as the No. 1 threat to life in persons of middle age and older. It is also known that individuals with a low blood pressure will outlive those with a higher, so-called normal, arterial tension gaged by average standards. An attempt will be made to analyze the part the kidneys play in the production of hypertensive states.

Normal Blood Pressure

A blood pressure of about 100 systolic and 70 diastolic, as found in children 10 years old, is the ideal pressure in man at any age, for it serves to furnish a tension of 30 to 40 mm. of mercury in the proximal capillaries, which is all the body is capable of utilizing for the carrying out of its metabolic processes. In the first place, a higher blood pressure is wasted power because no matter what the arterial tension may be, it is throttled down to the 30 to 40 mm. level as the proximal capillaries are reached. In the second place, it puts strain upon the arteries, the arterioles, and the heart, causing hypertensive disease whose intensity is in direct proportion to the height of the diastolic pressure.

Average Blood Pressures

It is an accepted fact that blood pressure rises with aging. The figures by decades from Hunter's tables of average normal blood pressures show this trend:

Age	Systolic Pressure	Diastolic Pressure	Pulse Pressure
10	103	70	33
20	120	80	40
30	123	82	41
40	126	84	42
50	130	86	44
60	135	89	46

This elevation of arterial tension has usually been attributed to arteriosclerosis—that is, a diminution in elasticity and an increasing rigidity of the arteries. If this were the sole reason for the physiologic changes in blood pressure characteristic of growing older, there should be a rise in the systolic pressure while the diastolic pressure remained the same or

even diminished. The actual figures, however, show that both the systolic and diastolic pressures increase with age. It is true that the systolic becomes more elevated than the diastolic and that, consequently, the pulse-pressure values increase, but the fact remains that the diastolic pressure does become greater and that this cannot be explained on the basis of arteriosclerosis.

The diastolic pressure rises because of some other factor. It is tempting to assume that renal ischemia with an overproduction of renin, as suggested by Goldblatt's¹ brilliant experiments, may be the cause.

The conclusion is made that as a rule there are two influences that, with advancing years, elevate the blood pressure above the normal in most persons. One of these is arteriosclerosis, the other, an unknown factor that may reside in the kidney.

Renal Disease Is Not the Sole Cause of Hypertension

Hypertension is often regarded as an entity with a unitarian etiology. Since the publication of Goldblatt's experiments, the trend is to ascribe the reason for an elevated arterial pressure to the kidney. Such a blanket conception for the origin of a permanent rise in blood pressure has led to the performance of many radical operations on the urinary tract which are not all justified.

The hypertension called essential hypertension and the hypertension due to renal disease (as we know from the observation of nephritis) are characterized by an elevation of both systolic and diastolic pressure. Besides urinary tract involvement, overactivity of the suprarenal cortex, pituitary basophilism, increased intracranial pressure, and mitral stenosis must be considered. Coarctation of the aorta also produces a blood pressure of this type, but only in the upper extremities. Consequently, it can be appreciated that an elevation of systolic and diastolic pressures in some cases is not associated with kidney impairments.

A common error is to diagnose the case with a high systolic and a low diastolic pressure as secondary to disease of the urinary tract. A

Symposium read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 9, 1940.

skull Encephalogram showed slight left-sided cerebral hypoplasia

Operation November 1, 1938—right parietal craniotomy The cortex appeared to be normal, except for the presence of an unusually large superior anastomosing vein and an unusually wide and dense pachionian granulation arising from the motor area. The pachionian granulations were divided, thus freeing the cortex from its dense attachment to the dura

Postoperative Course The postoperative course was smooth and uncomplicated, and the patient was discharged on December 8

Since the operation she has been receiving luminal, $\frac{1}{2}$ grain morning and evening On this medication during the sixteen months since her operation, she has experienced only two generalized convulsions during the daytime, both of these occurring on the same day At night she has regularly five or six mild left-sided transient spastic states, usually lasting a few seconds and usually without loss of consciousness While this patient is not completely cured, there has been a tremendous improvement, and her attacks no longer interfere with her daily social activities

Conclusions

The neurosurgical approach to the problem of epilepsy has been reviewed under the following subject headings

- (1) The present-day point of view
- (2) Etiologic factors
- (3) Clinical types
- (4) The diagnostic problem
- (5) Diagnostic methods—(a) minor and (b) major
- (6) Treatment of the epileptic—(a) medical and (b) surgical
- (7) The selection of patients for surgical treatment
- (8) The results of surgical treatment, with illustrative cases

The paper is intended not so much to report "results" as to inform the physician working in other fields of medicine that there is afoot, today, a revival of interest in, and an intensified attack upon, the old problem of epilepsy, with results that are at least encouraging

HEALTH INSURANCE IN CALIFORNIA

The figures of service by the California Physicians' Service and payments therefor have been broken down and classified for October, 1940, and published in *California and Western Medicine* for February

During October, when there were 18,561 beneficiary members in the service, there were 3,188 patients treated, representing 17.2 per cent incidence of illness among the membership during the month The sum of \$21,077.90 was disbursed to 1,441 doctors in payment of 15,614 units of service rendered, an average payment per doctor of \$14.63 The average number of units of service rendered per doctor was 10.8 and the average number of units of service rendered per case was 4.9 The unit value paid for the month was \$1.35

The distribution of units of service rendered during October was as follows 67.03 per cent

for general medical care, 14.08 per cent for surgical care, 7.03 per cent for x-ray services, 6.24 per cent for laboratory procedures, and 5.62 per cent for refractions

The distribution of patients by doctors was as follows 743 doctors saw 1 patient each, 312, 2 each, 163, 3 each, 74, 4 each, 45, 5 each, 34, 6 each, 21, 7 each, 20, 8 each, 9, 9 each, 6, 10 each, 6, 11 each, 2, 12 each, 4, 13 each, and 2, 14 each

It continues to be apparent that the distribution of patients is widely scattered among professional members and that, in proportion to the present beneficiary membership, a substantial percentage of professional members are participating The method of writing checks during the past few months has permitted the observation that a substantial number of new doctors participate each month

MILITARY SURGEONS' MEETING

The Metropolitan New York Chapter Association of Military Surgeons of the United States held a meeting and conference on U S Public Health Service and Medico-Military Medicine on April 19, 1941, at Marine Hospital, Ellis Island, New York Those participating included Rear Admiral James C Pryor, MC, USN (Ret.), Medical Director C C Pierce, U S Public Health Service, Captain Edward C White, MC, USN, Medical Director E R Marshall, U S Public Health Service, Medical Director A R Sweeney, U S Public Health Service, Colonel Samuel Adams Cohen, Med-Res U S Army, and Lieutenant-Colonel Edgar Erskine Hume, MC, U S Army

A KINDNESS ALL AROUND

Many of the local banks will readily make loans to patients to enable them to pay medical bills While many persons will not be able to negotiate such loans because their credit rating will not stand up under investigation and although not all banks have advertised this service, nevertheless it is advisable for members to discuss this matter with their local bank and to supply themselves with necessary forms

By referring the patient directly to the personal loan department of the bank, particularly if the patient is known to be a sound and reliable credit risk, the physician will have done a favor to all parties concerned

—Westchester Medical Bulletin

that some of the adrenal cortex must remain to enable renin to exert its pressor effect, that, if sufficient normal kidney tissue exists, the action of renin will be set aside, and that hypertension ceases after the removal of an ischemic kidney provided the other kidney is normal.

Renin is an enzyme contained in the kidneys, without pressor properties, an "activator," contained in the blood, is required to transform renin into "angiotonin," a highly active pressor substance, after a time angiotonin ceases to act—this is presumed to be due to the development of an "inhibitor" (Page, Page and Helmer^{4,5}). The probability of the formation of an inhibitor by normal kidney tissue to the pressor activity of renin has been previously expressed in Goldblatt's experiments and verified by the observations of Fasciolo, Houssay, and Taquini,⁶ as well as those of Solandt, Nassim, and Cowan.⁷ The effect of renin on blood pressure consequently depends upon its combination with an activator to form a pressor substance and its control by an inhibitor developed by the kidney. If a part of these materials—renin and inhibitor—can be isolated in the urine, it may prove possible to assay them and, for the control of hypertension, to extirpate only the kidney that eliminates a preponderance of renin, allowing the kidney with an excess of inhibitor to remain. This may prove to be feasible and would solve the question of how applicable unilateral nephrectomy is in any given case.

The portion of the kidney responsible for the formation of renin has not been identified. The first suggestion in regard to this comes from Goormaghtigh,⁸ who describes groups of special cells in the afferent glomerular arterioles which are in close contact with the lumen of these vessels. From their appearance he concludes that these cells have an endocrine activity that is related to the production of the hypertensive substance present in the ischemic kidney. Graef and Smith⁹ were able to demonstrate these cells in the human kidney, they state that the acceptance of the pressor influence of these cell groups in renal ischemia and other hypertensive conditions requires further study. This explanation for the production of renin may account for the fact that those conditions, such as chronic nephritis or renal ischemia, which affect the afferent glomerular vessels first, develop hypertension more frequently than those diseases, such as pyelonephritis, which damage the distal part of the nephron

first and involve the afferent glomerular arterioles last.

Other tissues than the kidneys may be responsible for the production of pressor material. This is an important point with regard to the production of hypertension in human beings. Thus far, this subject has received scant attention but the experiments of Ogden and his co-workers¹⁰ show that an elevation of blood pressure may be produced in dogs by limiting the blood flow to the gravid uterus. Such extrarenal sources of pressor substances may play a part in human hypertension, and it is obvious that this field has not been thoroughly explored.

A further possibility, for which there is some evidence, is that other pressor materials than renin, successfully isolated by Page and his co-workers, may emanate from renal tissue.

Urinary Tract Disease and Hypertension

Nephritis—In chronic diffuse glomerulonephritis with an initial albuminuria, hypertension usually develops before renal insufficiency, and death more often results from hypertensive effects than from retention uremia (Mosenthal and Lander¹¹). There is a high incidence of hypertension in the mild persistent chronic nephritis following acute nephritis (Payne and Illingworth¹²). The toxemias of pregnancy in subsequent years, usually after a considerable latent period, are prone to become hypertensive (Herrick and Tillman¹³). With these reports in mind and anticipating what will be mentioned in the next two sections, it becomes evident that chronic nephritis entails hypertension much more frequently than does either pyelonephritis or obstructive lesions in the urinary tract.

Pyelonephritis—The sequel of pyelitis, pyelonephritis, is now recognized as an exceedingly common disease. About one-third of the cases hitherto diagnosed as chronic glomerulonephritis are, in reality, chronic pyelonephritis. Longcope¹⁴ called attention to the frequent concurrence of hypertension and chronic pyelonephritis. The incidence of hypertension in pyelonephritis is less common than in nephritis, which may be seen from these statistical notations—of 30 cases of severe pregnancy pyelonephritis in ten to eighteen years, only 2 showed an increased blood pressure (Crabtree and Pren¹⁵), five to ten years after infection, a high percentage of 45 cases of pyelonephritis contracted during pregnancy suffered considerable kidney damage, but only 6 out of the 45 had an elevated

loss of elasticity throughout the greater part of the arterial tree (arteriosclerosis, old age) or a large pulse volume (heart block or any condition associated with an extremely slow heart rate, aortic insufficiency, hyperthyroidism, arteriovenous aneurysm, or paroxysmal hypertension with tumors of the adrenal medulla) is commonly responsible for such a blood pressure and is often regarded in the same light as essential, or urinary tract, hypertension in which the diastolic pressure is elevated and really constitutes the main threat to longevity

The fact that a pure type of hypertension is rarely found must be considered in the interpretation of every blood-pressure reading. Thus, in an older person with arteriosclerosis that results in a rise of the systolic pressure only, there may also be prostatic obstruction that elevates not only the systolic but also the diastolic pressure. It is evident that the analysis of every blood pressure reading becomes an exceedingly intricate and important problem, especially if the management of the urinary tract is to be guided thereby

This section cannot be regarded as complete without a consideration of "essential hypertension." This term evolved when it was observed about 1910 by a number of clinicians, among whom were Clifford Allbutt and Theodore Janeway, that a rise in blood pressure was not a compensatory process for a diminution in kidney function. The idea came into being that the hypertension was a primary process followed, because of the strain it inflicted upon the blood vessels, by a widespread arterio- and arteriosclerosis. It has been known for a long time that at autopsy the kidneys are more extensively involved than any of the other organs. This has been used as an argument that renal ischemia is the cause for the hypertension. However, occasional hypertensive cases have been reported in which the kidneys were completely normal, and it must be recognized that at autopsy we see only the end result and not the beginning of the stress that the hypertension has imposed upon the arteries and arterioles over a long period. Under the circumstances it would be hazardous to be certain as to which was the primary condition. In Goldblatt's experiments, when extreme compression was put upon both renal arteries and a high blood pressure was produced, the blood vessels throughout the body which were exposed to the impact of the hypertension showed malignant sclerotic changes, but the arterial system of the kidneys which was not subjected to an

increased pressure because of the renal artery occlusion was not affected. No further proof is needed to show conclusively that hypertension will result in arteriosclerosis. Under the circumstances and until more convincing facts are brought forward, it seems justifiable to subscribe to the opinion of the famous German pathologist, Fahr,² that hypertension may come about without any anatomic lesions existing in the kidney, the so-called essential hypertension, and that as the elevated blood pressure persists a more or less marked secondary renal arteriosclerosis develops. On the other hand, primary arteriosclerosis of the kidney does occur and, when sufficiently extensive, entails hypertension as a secondary phenomenon.

The renal lesion in essential hypertension, regardless of whether the kidney is primarily or secondarily involved, is a narrowing through arteriosclerosis of the afferent glomerular arterioles. It is hard to conceive that the compensatory circulation evoked by such operative procedures as nephro-omectomy will replace an occlusion of the afferent glomerular arterioles, which are terminal vessels for the glomeruli.

A new note is injected by Blackman's³ observations that in hypertensive disease the main renal arteries are narrowed in most instances, thus duplicating the lesion responsible for the production of experimental hypertension produced by renal ischemia. It might be that in such cases various forms of nephropexy would remedy the renal ischemia and relieve the hypertension, though the experimental efforts in this direction are not conclusive. It is very important that the observations of Blackman be checked by further series of cases to determine whether or not obstruction of the main renal arteries is, possibly, the prevalent cause of essential hypertension.

Kidney and Hypertension— Experimental Results

Goldblatt's successful production of a sustained elevation of blood pressure through renal ischemia and his subsequent numerous, well-conceived experiments have enabled him and his co-workers to clarify the hypertension problem a great deal. Some of the facts that Goldblatt has established are that occlusion of the main renal artery results in an overproduction of renin (a pressor substance demonstrated by Tregierstedt and Bergmann in 1898), that the nervous system plays no part in the elevation of blood pressure,

A UROLOGIC STUDY OF DIABETIC WOMEN

A Report on the Associated Findings of Hypertension

NATHANIEL KUTZMAN, M. D., ERNEST M. WATSON, M. D., and BYRON D. BOWEN, M. D.,
Buffalo, New York

IT IS generally recognized that infection, even though it be mild in character, may affect diabetic persons adversely. We have observed that many diabetic patients, although free from urologic symptoms, have pus and organisms in their urine. It has also been noted that many have hypertension. In an effort to obtain further information regarding the relationship, if any, of these facts, the following study was undertaken.

A great impetus was given to the study of certain types of hypertension of renal origin by the experimental work of Goldblatt,¹ who was able to produce hypertension by the partial occlusion of the renal arteries causing an ischemia of the kidney. Clinical corroboration of this experimental observation has been recorded by Longcope,^{2,3} McCann,⁴ MacKenzie,⁵ Nesbit,⁶ and many others.

Further stimulus was given to the urologic interest in hypertension by the work of Weiss and Parker,⁷ who demonstrated in great detail, and from a newer angle, the pathologic findings in chronic pyelonephritis. These observers were able to show that the picture of pyelonephritis was not unlike that of a partial occlusion of the renal arterioles—namely, (a) an interstitial inflammation with the usual small cell infiltration, (b) dilatation of the tubules, filled with a collagenous-like substance, (c) periglomerular fibrosis, and (d) a productive endarteritis with a partial occlusion of the lumen.

A complete urologic study was made of 85 diabetic women. These patients, most of

whom had no urologic complaints, were taken consecutively from the diabetic clinic and from the hospital wards. Their ages ranged between 36 and 79 years. In all cases the diabetes was under complete control.

The plan of the urologic study was as follows: (a) an inspection of the external genitalia with special reference to the presence or absence of cystocele, caruncle, and meatal contracture, (b) a determination of the amount of residual urine, if present, (c) a microscopic study of a catheter specimen of urine for pus, blood, organisms, and a determination of its pH, (d) The urethra was studied for stricture and, if found, was graded according to the dilatation necessary to permit the passage of a No. 24 F instrument, which we took as the normal urethral diameter, (e) Cystoscopic examination was then made and the bladder capacity determined (300 to 500 cc. was considered normal), inspection of the interior of the bladder was carried out to determine the presence or absence of stones, tumors, ulcers, diverticuli, etc., inflammation was graded from the simpler forms of trigonitis to the severer types of cystitis, and the appearance and position of the ureteral orifices were noted, (f) Catheterization of the ureters was then carried out with the usual No. 6 lead catheters, points of obstruction were noted, and the gross character, with the rate of flow of the ureteral urine, was observed, the specimens obtained from each kidney were studied microscopically and culturally (when this was not immediately possible specimens were placed in the refrigerator until the examination was carried out), thirty-minute phenolsulfonphthalein tests were made in all cases, and, when occurring, any transvesical leakage of the dye was carefully measured,

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 9, 1940.

arterial tension (Crabtree¹⁶) This difference in the liability to hypertension of nephritis and pyelonephritis is a remarkable one It has been mentioned that a descending process in the kidney which affects the afferent glomerular arteriole first, as would be the case in nephritis, may be more effective in the liberation of pressor material than an ascending process (pyelonephritis) that would involve the glomeruli last of all the segments of the glomerulotubular units

Incidence of Urologic Lesions in Hypertension—In 71 cases of "essential hypertension," Schroeder and Steele¹⁷ found some abnormality of the kidneys or ureters in 50 The observation on 600 hypertensive patients by Maher and Wosika¹⁸ revealed only 16.8 per cent, or 101 patients, with urologic lesions McCann¹⁹ reports that the search for "unsuspected obstruction and asymptomatic pyelonephritis" in cases of "essential" hypertension is frequently successful On the other hand, hypertension is not always present when urologic disturbances exist Dr Joseph Hyams²⁰ is carrying out such a survey at the New York Post-Graduate Hospital, and he believes that only 20 to 25 per cent of urologic impairments are accompanied by an elevation of blood pressure, a proportion that is about that of the occurrence of hypertension in the middle-aged and old population as a whole These figures coincide with the observations of Barney and Suby²¹ who cite a series of 305 cases of pyelonephritis and hydronephrosis of which 25 per cent had hypertension It would seem that the greatest caution is necessary to determine what is a causal and what is an accidental finding in the urinary tract of persons suffering from hypertension

Treatment of Urologic Lesions for the Control of Hypertension—Prostatic hypertrophy, with urethral obstruction and consequent retention of urinary excretory products in the blood, will be accompanied by an elevation of blood pressure This has been known for twenty-five years, and for the same period it has also been appreciated that the relief of such obstruction by retention catheter or by prostatectomy will often serve to lower the blood pressure The significance of this therapeutic result is twofold First, relief of obstruction in the urinary tract may return a blood pressure to normal, and, second, hypertension is a reversible process when the causal agent is removed

A considerable number of hypertensive cases relieved by unilateral nephrectomy have

been reported Many physicians interested in this procedure and its result are of the opinion that the successes have been given publicity but that the failures have been kept under cover Among the few statistics on this point are those of R S Palmer (quoted by Smithwick²²) who found that in 9 hypertensive cases in which the impaired kidney was removed the blood pressure was favorably affected in only 1, and those of Schroeder and Fish,²³ who obtained permanent lowering of the blood pressure in 2 out of 7 unilateral nephrectomies The point of view has been frequently expressed that this treatment should be carried out only in young persons in whom the hypertension had been of recent origin and when the function of the intact kidney was unequivocally normal Even when these criteria are adhered to, the effect on the hypertension appears to be unpredictable As mentioned previously, if an assay of pressor and inhibitor substances could be made in the urine, it might be determined whether one or the other kidney could be advantageously removed This, however, is a matter for future experimentation, but there is a possibility that it can be made serviceable

A definite indication that has emerged from the studies of hypertensive disease and the urinary tract is that all cases of pyelitis and prostatism not only call for treatment when they actually exist but also for preventive measures It might be advisable to have every man over 50 undergo a yearly examination of his prostate and to have every woman who has borne children have a yearly check-up with regard to the condition of her urinary tract Preventive measures may be worth a great deal more than actual treatment when hypertension has become established There is one big objection to this program and that is that the urologic surveys are expensive and there is a lack of adjustment of the patient's purse to the cost of these procedures in most hospitals

A UROLOGIC STUDY OF DIABETIC WOMEN

A Report on the Associated Findings of Hypertension

NATHANIEL KUTZMAN, M D, ERNEST M WATSON, M.D, and BYRON D BOWEN, M D,
Buffalo, New York

IT IS generally recognized that infection, even though it be mild in character, may affect diabetic persons adversely. We have observed that many diabetic patients, although free from urologic symptoms, have pus and organisms in their urine. It has also been noted that many have hypertension. In an effort to obtain further information regarding the relationship, if any, of these facts, the following study was undertaken.

A great impetus was given to the study of certain types of hypertension of renal origin by the experimental work of Goldblatt,¹ who was able to produce hypertension by the partial occlusion of the renal arteries causing an ischemia of the kidney. Clinical corroboration of this experimental observation has been recorded by Longcope,^{2,3} McCann,⁴ Mackenzie,⁵ Nesbit,⁶ and many others.

Further stimulus was given the urologic interest in hypertension by the work of Weiss and Parker,⁷ who demonstrated in great detail, and from a newer angle, the pathologic findings in chronic pyelonephritis. These observers were able to show that the picture of pyelonephritis was not unlike that of a partial occlusion of the renal arterioles—namely, (a) an interstitial inflammation with the usual small cell infiltration, (b) dilatation of the tubules, filled with a collagenous-like substance, (c) periglomerular fibrosis, and (d) a productive endarteritis with a partial occlusion of the lumen.

A complete urologic study was made of 85 diabetic women. These patients, most of

whom had no urologic complaints, were taken consecutively from the diabetic clinic and from the hospital wards. Their ages ranged between 36 and 79 years. In all cases the diabetes was under complete control.

The plan of the urologic study was as follows: (a) an inspection of the external genitalia with special reference to the presence or absence of cystocele, caruncle, and meatal contracture, (b) a determination of the amount of residual urine, if present, (c) a microscopic study of a catheter specimen of urine for pus, blood, organisms, and a determination of its pH. (d) The urethra was studied for stricture and, if found, was graded according to the dilatation necessary to permit the passage of a No. 24 F instrument, which we took as the normal urethral diameter. (e) Cystoscopic examination was then made and the bladder capacity determined (300 to 500 cc. was considered normal), inspection of the interior of the bladder was carried out to determine the presence or absence of stones, tumors, ulcers, diverticuli, etc., inflammation was graded from the simpler forms of trigonitis to the severer types of cystitis, and the appearance and position of the ureteral orifices were noted. (f) Catheterization of the ureters was then carried out with the usual No. 6 lead catheters, points of obstruction were noted, and the gross character, with the rate of flow of the ureteral urine, was observed, the specimens obtained from each kidney were studied microscopically and culturally (when this was not immediately possible specimens were placed in the refrigerator until the examination was carried out), thirty-minute phenolsulfonphthalein tests were made in all cases, and, when occurring, any transvesical leakage of the dye was carefully measured,

finally, plain x-rays, pyelograms, and pyeloureterograms were made both in the prone and in the upright position. Only 1 case of the series had intravenous pyelography carried out.

The detailed report of this study is being published [Ann Int Med] in its entirety by two of us (B D B and N K.). The following is a summary of a part of this work, with emphasis laid more particularly on the therapeutic measures employed. The total number of cases comprising this study was 85, and for the convenience of consideration the following grouping has been made.

I Bilateral pyelitis or pyelonephritis, hydronephrosis, and bilateral impairment of function, i.e., diminished phenolsulfonphthalein output (39 cases)

II Unilateral pyelitis or pyelonephritis, hydronephrosis, ptosis, stone, and unilateral impairment of function, i.e., diminished phenolsulfonphthalein output (15 cases)

III Lower urinary tract involvement alone (24 cases)

IV Normal urinary tract (7 cases). Only 1 of these or 14 per cent showed hypertension.

In a further effort of analytic study, group I was subdivided into

A Individuals with unequivocal bilateral reduction of kidney function (based on a one-half hour phenolsulfonphthalein test with a standard of 20 per cent of dye recovery from each kidney taken as normal). In this division there were 10 cases. Seven of these had an infection in one or both kidneys, also it was found that 7 cases showed a hydronephrosis, hydroureter, and a blunting of the calices, either unilateral or bilateral. In this division of 10 cases, 6 showed a definite hypertension.

B Individuals showing a unilateral reduction of renal function. Here were placed 15 cases, and all of these were found to have an active infection on one or both sides, of these, 13 cases showed a hydronephrosis, hydroureter, or blunting of the calices on one or both sides, while a stone in the kidney was encountered in 1 instance. In this division of 15 cases, 12 showed a definite hypertension.

C Individuals showing a normal renal function, but with other bilateral lesions. Here were placed 14 cases in which infection was demonstrated on one or both sides in 10 instances, while hydronephrosis, hydroureter, blunting of the calices occurred in 12 cases. Stone in the ureter was found in 1 instance. In this group with normal function, hypertension was found in 8 cases.

Of the group of patients showing bilateral involvement (39 cases) 2 cases showed a unilateral kidney infection in which no bladder infection could be demonstrated, and 3 cases showed a bladder infection in which no kidney infection was found. The group showed a consistent hypertension in 26 cases or 70 per cent of their number.

II In the group that had unilateral involvement (when one kidney and ureter was found to be absolutely normal) there were 15 cases analyzed as follows.

A Unilateral reduction of function only. This subdivision comprised 3 cases, hypertension was found in 2.

B Hydronephrosis, blunting of the calices, or hydroureter occurred in 11 cases, hypertension was found in 7.

This group harbored a kidney infection in 7 instances, and in 1 case a small calculus was demonstrated. In addition 5 had so-called minimal lesions (i.e., slight blunting of the calices with no infection). Hypertension was found in 60 per cent of this group.

III Cases showing lower urinary tract involvement alone.

A Infection in the bladder urine was observed in 13 cases, and in 5 additional instances there was cystoscopic evidence of an inflammatory process in the bladder without bacteria being found. The degree of bladder involvement was interpreted as (1) Grade 1 cystitis (trigonitis only—13 cases), (2) Grade 2 cystitis (trigonitis and moderate cystitis—2 cases), and (3) Grade 3 cystitis (trigonitis and severe cystitis—3 cases).

Inflammation in the bladder alone was thus found in 18 instances in this group, while a bladder involvement associated with an upper urinary tract infection was noted in 42 additional cases gleaned from the preceding divisions, thus showing an infection in 60 of the 85 cases comprising the entire series. There was no patient who had an unequivocal upper urinary tract infection without the lower tract being similarly involved. However, 2 patients did have a positive culture from one kidney of a pathogenic organism without any involvement of the bladder.

B Stricture of the urethra was encountered in 15 instances in the lower urinary tract group and were divided as follows: (1) Grade 1 stricture (1 case), (2) Grade 2 stricture (3 cases), and (3) Grade 3 stricture (11 cases).

Stricture of the urethra in the upper urinary tract group was demonstrated in 16 cases and divided as follows: (1) Grade 1 stricture (3

cases), (2) Grade 2 stricture (5 cases), and (3) Grade 3 stricture (8 cases)

The total number of strictures found in the entire series of 85 cases was 31. These two groups are not entirely comparable, since many of those classed in the lower urinary tract group were placed there simply because they had urethral strictures and no other urinary tract pathology.

Of the 24 cases showing lower urinary tract involvement, stricture of the urethra, cystocele, and residual urine in combination occurred in 4 instances, while stricture of the urethra and cystocele without any demonstrable residual urine was present in 14 cases. The total number of patients with residual urine in this group was 8.

In this group (24 cases) 12 or 50 per cent consistently showed hypertension.

Control Study

Since diabetic women showed evidences of active infection in such a high percentage of instances, it seemed imperative that we obtain some idea of the incidence of infection in nondiabetic women. However, it did not seem justifiable to subject a series of normal women to a complete urologic examination, so in an effort to get some sort of control data the bladders of 23 nondiabetic women who were undergoing treatment in the obesity clinic were catheterized. The urine was examined for pus and bacteria immediately and then cultured. None of these had any gross infection. However, 12 had a "rare" or a "few" pus cells, 10 only, and a few bacteria in the smear, while 6 had a completely sterile urine. In this control group 3 showed a growth of *Bacillus coli*, while the predominating organisms were anaerobic gram-negative gas-producing bacilli and anaerobic streptococci.

A further consideration in this study included an effort to determine the type of infection present and resulted in the following findings:

In the bilateral involvement group (upper urinary tract) of 39 cases the organisms identified were:

A. *B. coli* (*Escherichia*), 13 cases, *B. aerogenes*, 2 cases, *B. alcalescens*, 1 case, Morgan's bacillus, 1 case, *B. pyocyaneus*, 1 case, and *B. proteus*, 1 case.

B. Enterococci and anaerobic streptococci, 9 cases, and staphylococci, 2 cases.

C. Combination of groups (A) and (B) mixed infection, 9 cases.

D. Anaerobic gas-producing gram-negative bacilli, 1 case.

E. Hemolytic streptococci, 2 cases.

F. Sterile cultures, 5 cases.

In this group, 22 of the 39 cases were found to be positive for members of the *B. coli* group.

In the lower urinary tract involvement group the following organisms were identified:

A. Gram-negative bacilli (*B. coli*), 2 cases.

B. Enterococci, anaerobic streptococci, and staphylococci, 5 cases.

C. Combinations of groups (A) and (B), no cases.

D. Anaerobic gas-producing gram-negative bacilli, 12 cases.

E. Hemolytic streptococci, 3 cases.

F. Sterile cultures, 2 cases.

In this group of 24 cases only 2 were found positive for members of the *B. coli* group.

In our control series of nondiabetic cases the following organisms were identified in the urine cultures:

A. Gram-negative bacilli (*B. coli*), 1 case.

B. Enterococci and anaerobic streptococci, 6 cases.

C. Combination of groups (A) and (B), 2 cases.

D. Anaerobic gas-producing gram-negative bacilli, 5 cases.

E. Hemolytic streptococci, no cases.

F. Combination of groups (B) and (D), 3 cases.

G. Sterile cultures, 6 cases.

Of the 23 control cases only 3 were positive for members of the *B. coli* group.

Therapy

Since a great deal of importance has been stressed in the past on this eradication of infection in persons with diabetes, it is obvious from the above study that not enough attention has been paid to the urinary tract. It would seem therefore, that some form of routine procedure should be instituted for the study of the urinary tracts of diabetic patients, particularly women.

When it is assumed that the diabetes is controlled, a careful study as outlined above is justified, especially in those showing infection or hypertension or both. It has been shown in this study that there is a high incidence of lower urinary tract disease. Stricture was found in 31 instances, this, of course, can be handled by dilatation of the urethra. Our plan is to dilate the urethras of these patients up to 30 or 32 F at frequent intervals (i.e., from three to six weeks), gradually increasing the interval.

This procedure often helps in the reduction

of the residual urine as well as the clearing up of the infection

If cystoceles are found to be the factor in the production of residual urine, it is deemed advisable to repair them surgically or at least, if this is inadvisable, to use a well-fitting pessary

For the cystitis, suitable mild irrigations, instillations, and proper oral antiseptics, depending on the type of bacteria, have been used. Sulfanilamide and neoprontosil, which have been exceedingly well tolerated, and mandelic acid are the chief therapeutic agents we have used in this series

In the upper urinary tract it is wise to make every effort to prevent permanent kidney damage and loss of function. In cases of simple stricture of the ureter with moderate hydronephrosis, periodic dilatations of the ureter have been carried out. Where infection of the kidney was demonstrated, suitable oral remedies when the kidney function is good have been used

In unilateral disease, if there is a marked hypertension in the presence of infection with appreciable loss of function and if there does not appear to be improvement under conservative treatment, we believe a nephrectomy should be considered, providing the other kidney has normal function

Up to the present date this study has not progressed far enough to permit us to draw far-reaching conclusions on the ultimate effect of this routine. We have observed, however, that in many of these patients the progress of the urinary disease has been halted. The infection has been cleared up, the residual urine has been reduced, and in many instances the kidney function has been bettered, with a marked improvement in the general appearance of the patient. In some instances there has been observed a change in the pyelograms, so that mild and moderately severe hydronephrosis and hydroureters have returned almost to normal

Conclusion

1 The presence of sugar in the urine as found in persons suffering from diabetes is

probably a factor in increasing the incidence of infection in these patients

2 Although no comparable control study could be made of the urinary tract, it is possible that a much higher incidence of pathologic change is found in the urinary tract of diabetic patients than in nondiabetic patients

3 A high incidence of hypertension was observed in diabetic patients

4 The patients who had an involvement of the upper urinary tract, especially the "bilateral group," showed a somewhat higher incidence of hypertension when there was a reduction of kidney function, infection, and evidence of renal destruction

5 The lower urinary tract was found to be involved in a large number of cases, both in conjunction with upper urinary tract lesions and alone

6 The presence of stricture, cystocele, infection, and residual urine in the presence of sugar seems to act, and probably does act, as a predisposing factor to upper urinary tract involvement, since stasis is frequently a factor in the production of upper urinary tract disease

7 A brief outline of therapy has been presented

An expression of appreciation is due Dr Frederick J Parmenter, chief of the Urological Service, Dr Edward C Koenig, chief of the Roentgenological Department, and Dr Ernest Witebsky, of the Bacteriological Department, for their splendid cooperation and assistance

TUBERCULOSIS IN YOUNG WOMEN

ROBERT E. PLUNKETT, M D , and JULIUS KATZ, M D , Albany, New York

THE marked decrease in mortality from tuberculosis in the population as a whole and the fall of this disease from first to seventh place as a cause of death within the past thirty years have received so much attention that the importance of the disease in certain age groups has not been accorded the recognition it deserves. This is shown in part by the fact that for several years in some areas case-finding studies have been conducted more intensively among young school children, in whom the tuberculosis death rate is lowest, than among older individuals.

In upstate New York tuberculosis is still the leading cause of death among women at ages 20 to 34 and is among the first three causes of death in women between 10 and 40 and in men between 20 and 50. The relative importance of the disease in the various age groups differs in the two sexes (Table 1).

The difference in shape of the curve of mortality by age among men and women is well known (Fig 1). The rates in both sexes fall from a relatively high point in infancy and early childhood to a very low level in the 5-to-14-year age group. From this point, the rates diverge. Among women there is a sharper increase than among men up to 25 to 34 years, where the rate for women falls slightly below that for men. This was the high point of mortality for women in upstate New York in the five-year period 1920 to 1924 and was the highest point in 1934 to 1938, with the exception of the comparatively small group 75 years of age and over. The rate for men in 1934 to 1938, however, continued to rise to a maximum at 45 to 54 years of age, where it was almost three times as

high as in women. From this point the rate declined among men but remained much higher than the female rate through the rest of the life span.

Not only do the mortality rates differ between men and women in the various age groups but the decreases in mortality in specific age groups over a period of years vary with age and sex (Fig 2). Thus, since 1915 in upstate New York the rate of decline has been greater among men than among women in all age groups except those over 45 years. In the groups under 45 the greatest difference between men and women appeared at 15 to 24 years, where the rate has decreased by 86 per cent in men and 79 per cent in women. It is interesting that among women in this age group there has been a considerably sharper decline in rate since 1924 than for the ten years previously, similar to the condition found by Hart and Wright¹ in England and Wolff² in the United States registration area.

Although the mortality rate in 1915 among women between 15 and 24 was considerably higher than that in the group aged 45 years and over, the relatively more rapid decrease in mortality in the younger women has caused the rates to approximate each other, so that since 1936 the rate for the older women has actually been somewhat higher than for the younger group. This suggests the need for increasing study not only of the 15-to-24-year group but also of women in the older ages.

In spite of the differences in the rates of decrease at the various ages, however, one of the most outstanding features of the curve of mortality by age and sex is its similarity from year to year (Fig 1) and the close resemblance of the curve for this State to that for the United States and even to that of England.¹

Numerous explanations have been offered

for the higher death rate and for the slower decline in young women than in young men

1 One of the earliest theories proposed was the increasing industrialization of women, with its physical and nervous strain and increasing opportunity for exposure to infection. While some authorities^{3,4} find no evidence for this theory, nevertheless, Hart and Wright¹ find a definite statistical correlation between the proportion of young girls, aged 14 to 20, entering gainful occupations and the tuberculosis mortality rate of girls aged 15 to 25 of the same generation

2 The effects of changes in the standard of living, particularly as indicated by changes in housing conditions, are stressed by Hart and Wright¹. These authors found that a slowing up in the improvement of housing facilities resulted in a decrease in the rate of decline of mortality from tuberculosis, especially in young women, while acceleration in the build-

ing of new houses, with alleviation of overcrowding, increased the rate of decline

It cannot be doubted that these factors, and probably many others, influence the mortality rate in young women. Nevertheless, the fact that the mortality curve shows such definite characteristics (Fig 2) and that the rate among young women was higher than that for young men as far back as 1860, before such factors as the entrance of women into industry reached important dimensions, indicates that such environmental forces are only contributory to differences resulting from basic biologic phenomena

3 Wolff² finds a definite association between tuberculosis and the generative activity of women. He cites as an example the fact that the great increase in the birth rate in most countries following the World War was accompanied by a failure of the tuberculosis mortality rate to decline as rapidly in young women, particularly between the ages of 15 and 25, as in young men of the same age. In almost all other age groups, on the other hand, the decrease in the death rate was greater in women, and the rate itself was lower than for men

4 Rich,⁵ in discussing the subject of age-determined factors in tuberculosis, stresses the important role played by the physiologic phenomena of pubescence by pointing out first, that in spite of the evidence of increased tuberculous infection in the age period between 5 years and puberty there is actually a decrease in the mortality, whereas at puberty and during adolescence the increase in disease is far greater than that of infection, second, that Opie and McPhedran have shown that even in familial exposure to open cases of tuberculosis twice as many cases of clinical tuberculosis developed in the 10-to-14-year age group as in the 1-to-9-year group, third, that the mortality rise occurs at an earlier age in women than in men, probably because of the earlier occurrence of puberty changes in the former

Since the age incidence of active tuberculosis is similar to the incidence of mortality,⁶ tuberculosis-control efforts, to be most productive of results, must be directed against the groups with the higher mortality rates. The high rates among young women and the failure of the rates to decline as rapidly as in men of the same age indicate that this group might be studied profitably. Additional evidence of the importance of examining this group is afforded by the fact that, in the three-year period 1936 to 1938, 26 per cent of all cases of

FIG 2

tuberculosis reported among women in up-state New York were between 15 and 25 years of age, and 53 per cent were between 15 and 34

For many years the New York State Department of Health has recognized the importance of two main groups in its case-finding program first, contacts of open cases of tuberculosis and those referred to the clinic by the family physician because of suspicious symptoms or signs, second, special groups of the population in whom tuberculosis may be an important health hazard

The case-finding value of the first part of the program, the examination of contacts and suspects, has been emphasized² and need not be discussed here, except to mention the results of the examination of young women. In 1937 the yield in new cases of tuberculosis in women aged 15 to 24 examined in the State tuberculosis hospital clinics was 3.1 per cent

compared with 2 per cent in men of the same age. This was the only age group in which the case yield was higher in women than in men.

As part of the second phase of the program, that is, the study of special population groups, the following groups of women have been studied: normal school students, a group of girls in one of the State schools for delinquents, and a group of women in a food-packing industry.

In cooperation with the State Department of Education, a study of tuberculosis among the students of ten of the normal schools in the State has been conducted since 1933, in order to determine the importance of the disease as a menace to the health of these students. The examination of this group is of additional importance in that the diagnosis of tuberculosis and institution of treatment in the early, non-infectious stage will serve to prevent the in-

NORMAL SCHOOLS 1933-1939

FIG 3

fection of the young pupils whom these individuals might be called upon to teach. Furthermore, the personal participation of future teachers in a study of this kind is of considerable educational value because it arouses their interest in the disease and in the methods used in its control.

The students are between 17 and 21 years of age, white, and from the lower middle-class social and economic group. About three-fourths of the total are girls. The procedure consists of tuberculin-testing all freshmen with 0.1 mg of O.T. and x-raying the positive reactors. The negative reactors are retested in the second and third years, while all positive reactors are x-rayed annually but are not retested. Inasmuch as it was impractical to perform several tests with increasing doses of tuberculin during the annual visits to each school, it was decided to use this dose in spite of the knowledge that a certain proportion of those negative to this dose would react positively to a larger dose. Moreover, the number of cases of clinically significant pulmonary tuberculosis which might have been missed by this screening is probably negligible. The course of study in the normal schools is of three years' duration in eight of the ten schools and of four years' duration in two, but, since a number of students leave school annually before completing their courses, many dropped from observation before receiving all three tests or x-rays.

A total of 7,536 students were examined, of whom 3,203 were examined only once, 1,962, only twice, 2,260, three times, and 111 students taking the four-year courses, four times.

At the time of the first examination the prevalence of infection in the entire group was 28 per cent, with 31 per cent positive reactors

among the boys, and 27 per cent among the girls. These figures are somewhat higher than those given by Stiehm⁸ but are in general accord with his finding that the rate among students from the eastern states is higher than that among students from the rest of the country. Among the girls who were tuberculin negative at the time of first examination, 4.3 per cent were positive at the second, and 2.6 per cent of those negative at the first two tests were positive at the third. The average yearly increase in the infection rate was 3.7 per cent compared with Stiehm's figure of 2.4 per cent.

The prevalence of infection among students at the time of admission to school dropped from 37 per cent in 1933 to 24 per cent in 1939, a decrease of 35 per cent. The decrease was somewhat greater among the girls, 36 per cent, than among the boys, 32 per cent (Fig 3).

In view of the recent findings in Tennessee⁹ and elsewhere of a high percentage of individuals showing calcium deposits on x-ray examination but having negative tuberculin reactions, a study was made in 1939 to determine whether a similar condition existed in New York State. In that year 1,564 freshmen were x-rayed regardless of the results of the tuberculin test, and all x-ray films were interpreted without any knowledge of the tuberculin reaction. Six per cent of the positive reactors showed x-ray evidence of calcium deposits, while only 1.6 per cent of the negative reactors showed such findings. These results confirm our former opinion that the prevalence of calcium deposits among negative reactors is low in this State. No cases of clinical pulmonary tuberculosis were found among the negative reactors.

In the total of 7,536 students examined, 29 cases of clinically significant pulmonary tuberculosis were found, a rate of 0.38 per cent, which is lower than the figure of 0.6 per cent mentioned by the Tuberculosis Committee of the Student Health Association.¹⁰ The rate was practically the same for the boys as for the girls. Contrary to the findings of Stiehm, most of the cases were discovered at the first examination, only 4 cases developing subsequent to the first examination. Of the 29 cases, 25 (86 per cent) were minimal and 4 (14 per cent) were moderately advanced. One of the cases developing subsequent to the first examination was moderately advanced at the time of the second examination one year later.

Since the wide variation in the incidence of tuberculosis in various schools¹¹ is due, in part at least, to differences in case-finding techniques

and possibly to differences in standards of x-ray diagnosis, it is important to define our criteria for the x-ray diagnosis of pulmonary tuberculosis. In this classification are included only those cases with definite parenchymal involvement of the reinfection type suggesting activity or possible activity of the lesion. Calcified areas either in the parenchyma or hilum, fibrous strands, and apical or basal pleuritis are not considered of clinical significance.

The progress of the cases of tuberculosis diagnosed has not been followed, the students being referred to their private physicians and the local tuberculosis hospitals for further study and treatment. All of the cases have left school for sanatorium care.

The second special section of the population chosen for study was a group of 799 inmates of a New York State school for delinquent girls. These girls were between 13 and 17 years of age and were committed to the school by the children's courts of several of the larger cities of the State, chiefly New York City. About one-third of the girls were colored, and most of them came from families of a low economic status. This group was chosen for study because of their age, their poor home environment, and low family financial level. The procedure consisted of a single x-ray film of the chest.

Among the 799 individuals x-rayed, 6 cases of clinically significant pulmonary tuberculosis were discovered, a rate of 0.75 per cent. Four of the cases were minimal, 1 was moderately advanced, and 1 was far advanced. Two of the cases were found among the Negro girls, making the case rate among Negroes about the same as among the whites.

The third special study was made among 636 female employees in a food-packing industry. This group was selected because it included food handlers and because the age group seemed to be one in which a high yield of cases of tuberculosis might be expected.

The average age of these women was 34. Less than 2 per cent of the group were Negroes. A single x-ray film of the chest was made. Only 1 case of tuberculosis was found.

A precise explanation of the differences in the prevalence of tuberculosis in these three groups is difficult, but undoubtedly differences in standards of living and other social and economic factors play an important role.

It may be of interest to mention briefly a group of women regarding whom much discussion has appeared in the literature within the past few years—namely, student nurses.

The subject of the occupational hazard from tuberculosis in this group is a controversial one, and opinions vary from that of Hembeck,¹² who finds an extremely high incidence of tuberculosis, to that of Brahdy,¹³ who claims that the incidence of disease is no greater among nurses than in any other group of women of the same age. All writers on the subject agree, however, that the danger of infection is much greater among nurses than in other groups and that students who begin their courses of training with negative tuberculin reactions almost invariably acquire a primary infection during their period of training.

Summary and Discussion

There is abundant statistical evidence that tuberculosis among young women is of major importance. We possess insufficient information to define the influence that constitutional or environmental factors have upon this problem. Three groups of young women, totaling over 7,000 individuals, were examined for tuberculosis, with a yield of but 0.4 per cent for the entire group. This rate seems low, especially in comparison to that found among contacts and suspects. However, this should not suggest the discontinuance of these studies. On the contrary, the study of tuberculosis among women in industry, during pregnancy, after labor, and in many other groups should be continued. Aside from their value as case-finding procedures, the data obtained from such studies will permit more accurate estimates of the danger of tuberculosis in various population groups and will facilitate the institution of control measures.

A total of 7,536 students were examined, of whom 3,203 were examined only once, 1,962, only twice, 2,260, three times, and 111 students taking the four-year courses, four times.

At the time of the first examination the prevalence of infection in the entire group was 28 per cent, with 31 per cent positive reactors

among the boys, and 27 per cent among the girls. These figures are somewhat higher than those given by Stiehm⁸ but are in general accord with his finding that the rate among students from the eastern states is higher than that among students from the rest of the country. Among the girls who were tuberculin negative at the time of first examination, 43 per cent were positive at the second, and 26 per cent of those negative at the first two tests were positive at the third. The average yearly increase in the infection rate was 3.7 per cent compared with Stiehm's figure of 2.4 per cent.

The prevalence of infection among students at the time of admission to school dropped from 37 per cent in 1933 to 24 per cent in 1939, a decrease of 35 per cent. The decrease was somewhat greater among the girls, 36 per cent, than among the boys, 32 per cent (Fig 3).

In view of the recent findings in Tennessee⁹ and elsewhere of a high percentage of individuals showing calcium deposits on x-ray examination but having negative tuberculin reactions, a study was made in 1939 to determine whether a similar condition existed in New York State. In that year 1,564 freshmen were x-rayed regardless of the results of the tuberculin test, and all x-ray films were interpreted without any knowledge of the tuberculin reaction. Six per cent of the positive reactors showed x-ray evidence of calcium deposits, while only 1.6 per cent of the negative reactors showed such findings. These results confirm our former opinion that the prevalence of calcium deposits among negative reactors is low in this State. No cases of clinical pulmonary tuberculosis were found among the negative reactors.

In the total of 7,536 students examined, 29 cases of clinically significant pulmonary tuberculosis were found, a rate of 0.38 per cent, which is lower than the figure of 0.6 per cent mentioned by the Tuberculosis Committee of the Student Health Association.¹⁰ The rate was practically the same for the boys as for the girls. Contrary to the findings of Stiehm, most of the cases were discovered at the first examination, only 4 cases developing subsequent to the first examination. Of the 29 cases, 25 (86 per cent) were minimal and 4 (14 per cent) were moderately advanced. One of the cases developing subsequent to the first examination was moderately advanced at the time of the second examination one year later.

Since the wide variation in the incidence of tuberculosis in various schools¹¹ is due, in part at least, to differences in case-finding technics

others in which the work has been intensive for years and in which there have been material changes in living conditions I cannot help feeling that the most important factor is this "biologic influence," whatever it is. Has it been a general decline in virulence of the tubercle bacillus, a general accumulation of some degree of immunity, or a combination of the two? Perhaps some of the tuberculosis experts would be willing to venture an opinion.

Dr B. E. Roberts, *Poughkeepsie, New York*.—I feel it is a source of great encouragement that in this study, and other recent studies, the principles of epidemiology are being considered to a much greater extent than in the past. The

time factor, which I believe is the "fourth dimension" of Professor Einstein, makes the study of tuberculosis both difficult and interesting. I wonder whether the failure of the upper age group to experience a sharp drop in tuberculosis mortality in recent years is not merely one aspect of the time factor, in that deaths at these ages may occur largely in persons whose onsets were many years previously, at a time when the general frequency of infection was higher.

The reference made to the fact that active tuberculosis was seldom found on re-examination appears to be highly important from the standpoint of deciding upon the most effective use of public funds and to merit comment upon the implications involved.

DIA BETA EATA FRATERNITY

(In the treatment for diabetes some physicians with home offices serve breakfast to patients after the administration of insulin.)

Most human lives are fraught with ills,
Some cured by knives and some with pills,
But few entirely escape,
And go through life in first-class shape
Now, of the several diseases
That in their deadly clutches seize us,
And for which physicians treat us,
Is the insidious diabetes
One don't suspect that he has got it
Until by accident they spot it
When one's examined for some other—
Perhaps imaginary—bother
Then, if in luck, perhaps you'll pass
Into the doctor's morning class
At nine you seek the doctor's door,
As many others have before,
And to the nurse, a charming miss,
You hand your specimens of—thus
Detail needs no explanation,
Though 'tis a source of information
Then, in the waiting room you'll find
A group of others of your kind
Graciously they all unbend,
And greet you as an oldtime friend,
For there's a sort of brotherhood
Twixt those with sugar in their blood,
For whether of high or low condition
It seems to sweeten the disposition
And so they're friendly with each other,
Greeting a newcomer as a brother
And here they sit and hold confab
While waiting for the needle's jab,

This enters well beneath the skin
And pumps one full of insulin

Ah, insulin! Good insulin!
But for you what might have been?
I might be lying stark and cold,
Pushing daisies up through the mold
Instead of which you and my diet
Rouse emotions once almost quiet,
And fill me with so much of pep
That if I do not watch my step
The chances are that I shall fail
To keep outside the county jail

But I digress, my tale's not done,
For, after jabbing everyone
We're sent into the breakfast room,
A place that never harbors gloom,
Where Mrs. Doctor, gracious hostess,
Loves to cerealize and toast us
And there we sit in friendly chatter,
As if there's not a thing the matter,
While in and out the doctor slips
With good advice and merry quips
I know of nothing that's more pleasant
Than class meets with the doctor present

But, though the meetings of the class
In a fraternal spirit pass,
All those who hope to graduate
Their vigilance must not abate,
So be advised by him who writes,
Obey the rules the doctor cites
From ancient dame to little laddie
We hail him as our sugar daddy

SELECTION OF BLOOD BANK DONORS

Only those persons who have been born in this country and who have never lived in districts where malaria is prevalent should be used as donors for blood banks, Dr Ernest F. Gordon, Yonkers, New York, advises in the *Journal of the American Medical Association* for March 22. He says that such a policy will minimize the possibility of spreading the disease from man to man. The first recorded case of an accidental transmission of malaria through transfused stored blood is reported by him.

MEDICAL LIBRARY ASSOCIATION

The forty-third annual meeting of the Medical Library Association will be held this year at the University of Michigan Medical School, Ann Arbor, Michigan, on Thursday, Friday, and Saturday, May 29, 30 and 31, under the presidency of Col. Harold W. Jones, of the Army Medical Library, Washington. D. C. Hotel headquarters will be at the Michigan Union. The program will include papers on the Cooperation of Libraries, Union Catalogues, Medical History, and Industrial Medicine.

Discussion

Dr Herbert R. Edwards, *New York City*—Drs Plunkett and Katz have presented a most timely subject in a most acceptable manner. The present-day trend in case finding among healthy and apparently normal adults rather than children has been of the greatest significance in the tuberculosis control program. That part of the population designated as "young women" represents only a section of the apparently healthy population that should be included in the surveys of the type presented by Drs Plunkett and Katz. It is of interest to note that they have emphasized the importance of women above the 15-to-24-year group. It is generally accepted today that the mass survey as a method of case finding is most productive among those over 15 years of age, those who are unemployed or on home relief, those living in tenement houses and among Negroes.

The greatest value in studies of this type is the fact that the majority of the cases are detected at a time before the disease has progressed to an advanced stage with the characteristic symptoms, for it is in that stage when infection is so easily spread to others. It is, therefore, conceivable that by a broad application of the mass survey principle we can accomplish more in the ultimate control of tuberculosis than by any other method.

The prompt examination of contacts to known cases and isolation of open cases in the sanatorium and hospital are fundamentals of tuberculosis control and need no extended discussion here. It must be remembered, however, that once the disease has developed to an advanced stage the chances for cure are limited. Today our hospitals have only about 10 per cent of their cases registered with minimal lesions, the remainder are beyond that curable stage. Thus, it is not surprising that 20 per cent of the discharges are by death and that less than half of those discharged alive will survive five years without a relapse or death.

The use of the tuberculin test as a preliminary screen in surveys of this type is more easily applied than in those not under some type of institutional supervision. In this experience it represents a saving of approximately 65 per cent of the x-rays that would be needed if all were routinely x-rayed—a matter of the greatest importance in the budget.

Here in New York City the Department of Health x-rayed 15,795 high-school students irrespective of their reaction to the tuberculin test to determine the possible prevalence of tuberculous lesions in negative reactors. Our results definitely confirmed the reliability of the tuberculin test as a screening method. When a single test was done we missed 9 per cent with apparent tuberculous lesions, the majority of which reacted to the second dilution of 1 mg. We can agree with Drs Plunkett and Katz in that no cases of

clinical pulmonary tuberculosis were found among the negative reactors.

It will be noted that the cases discovered by Drs Plunkett and Katz were referred to their private physicians or the local tuberculosis hospital for further study. This, I believe, is an answer to the practitioner who objects to the conduct of such studies because it tends to take his patient away from his supervision. Here again the experience in New York City gives ample evidence that the case-finding survey, in fact, places far more cases under the care of the practitioner than it takes away.

The differences in the yield of significant cases reported in this study compares somewhat with experiences here in New York City. In 15,795 high-school pupils with an average age of 16.2 years, there were 58 or 0.4 per cent. In 16,810 students in city colleges with an average age of 18.8 years, 34 or 0.2 per cent were clinically significant. In 8,708 National Youth Administration enrollees, 79 or 0.9 per cent were classified as significant. The main differences between these groups were that in the colleges approximately 80 per cent were Jews compared to about 30 per cent among the high schools and National Youth Administration. There is less tuberculosis among Jews than Gentiles in New York City. Also the colleges represented a much higher level income group as compared to the other two, and it has been our experience that tuberculosis increases in a direct proportion to the lowering of the economic level.

Furthermore, our experience among employed adults as compared to the unemployed has shown consistently more significant disease among the latter. Thus, the economic background of the individual is a determining factor in the prevalence of tuberculosis.

Drs Plunkett and Katz have wisely emphasized the importance of re-examination of the students in the normal schools. A single survey indicates only the disease apparent at the time and gives no assurance of the future safety of the individual so far as tuberculosis is concerned. In those groups with an appreciable amount of tuberculosis, plans should be made to repeat the examination at periodic intervals during the age period in which the individual is most likely to develop the disease.

Dr Paul B. Brooks, *Albany, New York*—Reference has been made in the course of this discussion to what was called a "peculiar biologic influence" that seems to have been at work and to have been a factor in the general decline of tuberculosis. Among the other important factors mentioned was improvement in housing and living conditions. It has been a puzzling thing to me that the progressive decline has seemed to be general practically the same in sections where there have not been many changes in living conditions and where comparatively little preventive work has been done as in the

others in which the work has been intensive for years and in which there have been material changes in living conditions I cannot help feeling that the most important factor is this "biologic influence," whatever it is. Has it been a general decline in virulence of the tubercle bacillus, a general accumulation of some degree of immunity, or a combination of the two? Perhaps some of the tuberculosis experts would be willing to venture an opinion.

Dr B E Roberts, *Poughkeepsie, New York*.—I feel it is a source of great encouragement that in this study, and other recent studies, the principles of epidemiology are being considered to a much greater extent than in the past. The

time factor, which I believe is the "fourth dimension" of Professor Einstein, makes the study of tuberculosis both difficult and interesting. I wonder whether the failure of the upper age group to experience a sharp drop in tuberculosis mortality in recent years is not merely one aspect of the time factor, in that deaths at these ages may occur largely in persons whose onsets were many years previously, at a time when the general frequency of infection was higher.

The reference made to the fact that active tuberculosis was seldom found on re-examination appears to be highly important from the standpoint of deciding upon the most effective use of public funds and to merit comment upon the implications involved.

DIA BETA EATA FRATERNITY

(In the treatment for diabetes some physicians with home offices serve breakfast to patients after the administration of insulin)

Most human lives are fraught with ills,
Some cured by knives and some with pills
But few entirely escape,
And go through life in first-class shape
Now, of the several diseases
That in their deadly clutches seize us,
And for which physicians treat us,
Is the insidious diabetes
One don't suspect that he has got it
Until by accident they spot it
When one's examined for some other—
Perhaps imaginary—bother
Then, if in luck, perhaps you'll pass
Into the doctor's morning class
At nine you seek the doctor's door,
As many others have before,
And to the nurse, a charming miss,
You hand your specimens of—this
Detail needs no explanation,
Though 'tis a source of information
Then, in the waiting room you'll find
A group of others of your kind
Graciously they all unbend,
And greet you as an oldtime friend,
For there's a sort of brotherhood
Twixt those with sugar in their blood,
For whether of high or low condition
It seems to sweeten the disposition
And so they're friendly with each other,
Greeting a newcomer as a brother
And here they sit and hold confab
While waiting for the needle's jab,

This enters well beneath the skin
And pumps one full of insulin

Ah, insulin! Good insulin!
But for you what might have been?
I might be lying stark and cold,
Pushing daisies up through the mold
Instead of which you and my diet
Rouse emotions once almost quiet,
And fill me with so much of pep
That if I do not watch my step
The chances are that I shall fail
To keep outside the county jail

But I digress, my tale's not done,
For, after jabbing every one
We're sent into the breakfast room,
A place that never harbors gloom,
Where Mrs. Doctor, gracious hostess,
Loves to cerealize and toast us
And there we sit in friendly chatter,
As if there's not a thing the matter,
While in and out the doctor slips
With good advice and merry quips
I know of nothing that's more pleasant
Than class meets with the doctor present

But, though the meetings of the class
In a fraternal spirit pass,
All those who hope to graduate
Their vigilance must not abate,
So be advised by him who writes,
Obey the rules the doctor cites
From ancient dame to little laddie
We hail him as our sugar daddy

SELECTION OF BLOOD BANK DONORS

Only those persons who have been born in this country and who have never lived in districts where malaria is prevalent should be used as donors for blood banks, Dr Ernest F Gordon, *Yonkers, New York*, advises in the *Journal of the American Medical Association* for March 22. He says that such a policy will minimize the possibility of spreading the disease from man to man. The first recorded case of an accidental transmission of malaria through transfused stored blood is reported by him.

MEDICAL LIBRARY ASSOCIATION

The forty-third annual meeting of the Medical Library Association will be held this year at the University of Michigan Medical School, Ann Arbor, Michigan, on Thursday, Friday, and Saturday, May 29, 30 and 31, under the presidency of Col Harold W Jones, of the Army Medical Library, Washington, D C. Hotel headquarters will be at the Michigan Union. The program will include papers on the Cooperation of Libraries, Union Catalogues, Medical History, and Industrial Medicine.

EXPERIENCES IN A THYROID CLINIC IN A GENERAL HOSPITAL

WILLIAM CRAWFORD WHITE, M D , New York City

FOR many years at the Roosevelt Hospital it had been the custom to treat thyroid cases in a routine manner as part of the general run of cases admitted to the medical and surgical wards. About ten years ago it was felt that better understanding of the disease and better treatment would result if the work was concentrated into the hands of a small group who would diagnose, treat, and follow up all such patients who came to the hospital. Also, in order that the knowledge so gained should be diffused throughout the staff, it was arranged that there should be a gradual rotation of men assigned to such work. This method has been followed out in the past eight years with the exception of our psychiatrist, Dr Robert W Laidlaw, who has rendered invaluable help throughout the whole period. In addition to Dr Laidlaw, two physicians and two surgeons have attended, once a week, a combined diagnostic and follow-up clinic.

At first the clinic was small. As the merit of this undertaking became evident its volume increased, so that each session now keeps the staff interested and occupied. When goiter was recognized or suspected in other outpatient departments, the patients were referred to the clinic for diagnosis and treatment. If surgery was indicated, the patient was referred into the hospital ward where she was placed under the care of the two surgeons who were in attendance at the thyroid clinic.

As a result of this specialized clinic, we have made certain observations and come to some conclusions we should like to relate.

Terminology

We recognize the multiplicity of terms that have been used to describe the various pathologic conditions of the thyroid gland, together with their clinical manifestations. However, for the purpose of this paper we have endeavored to divide goiter into several broad groups, while at the same time we realize that there are some cases that might not fit readily into these groups. We shall use the following classification: (1) nontoxic nodular goiter, (2) chronic thyroiditis, (3) carcinoma, (4)

toxic nodular goiter, (5) hyperplastic diffuse thyroid disease with or without exophthalmos. It will be noted that we have not mentioned hypothyroid disease and its manifestations, as these patients were followed in the medical and pediatric services.

Nontoxic Nodular Goiter

In this group we have included the nontoxic diffuse type of gland enlargement—the fetal, the solid, and the cystic adenoma. From the pathologic point of view there is much to be said in favor of calling these conditions steps in the same process. At any rate, for this paper they have been placed together.

The patients had been born in scattered areas of the United States and Europe, in areas where endemic goiter was known to be present, as well as in areas that were supposed to be free of the disease. Most of them had reached adult life before they had migrated to New York City. They usually applied for relief of deformity or pressure symptoms after many years with a known goiter.

All patients were subjected to a general physical examination, including a throat examination for vocal-cord function. In addition, a basal metabolism test was performed, and x-ray films of the neck and chest were made for evidence of tracheal deviation or compression, as well as substernal extension.

If the deformity is slight, a question naturally arises as to the need or propriety of surgery. At first we were inclined to permit such patients to go without surgical interference, with the advice to return to the clinic if the nodule grew or gave them trouble. However, in 3 patients who were operated upon for simple nodular goiter, cancer was unexpectedly discovered. Because of this experience we have changed our policy and now advise the removal of all nodules from the thyroid gland.

When the disease was confined to one lobe, the operator often was content to do a partial thyroidectomy of that lobe only. When more extensive, a bilateral partial thyroidectomy was performed. In view of the nontoxicity of the patient we were content to leave fairly large remnants. As would be expected, this group had but little postoperative disturbance. Their subsequent course in the follow-up clinic was uneventful.

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 9 1940

From the Roosevelt Hospital

There were 225 patients in this group. All had one-stage operations, with 2 deaths.

Chronic Thyroiditis

Six patients who were thought to be in the previous group were suffering from chronic thyroiditis. One was also called Hashimoto's disease. The woman was 33 years of age and had a large uniform swelling, 175 Gm. were removed by Dr. Patterson. Subsequently, the thyroid remnant enlarged greatly, large axillary nodes appeared, and large abdominal masses appeared. All these quickly shrank under roentgen therapy. This would seem to justify a change of diagnosis to lymphosarcoma because of its behavior under roentgen ray, but our pathologist, Dr. Walter Brandes, still thinks that the thyroid tissue removed has the appearance of Hashimoto's disease. The 2 cases of Riedel's struma had simple convalescence with no further trouble. The other 3 had no further trouble.

Carcinoma of the Thyroid

There have been 21 cases (4 per cent of the total) that were diagnosed as carcinoma of the thyroid. The 3 patients of malignant adenoma with blood vessel invasion were alive and well six, seven, and eight years after operation. The 10 cases of papillary adenocarcinomas on the whole did fairly well with surgery alone. Some have been free of the disease for years, others have had repeated recurrences with operation and survival for as long as fifteen years, while 2 died of metastases in ten months and seven years, respectively. Roentgen therapy did not appear to influence the course of the disease. The 8 cases of small cell adenocarcinoma did not do well in spite of surgery and roentgen therapy. One lived for one and one-half years, but the others died within a few months.

Toxic Nodular Goiter

The diagnosis of toxic nodular goiter is a problem of a different sort and one that causes many a warm discussion. The typical patient was a woman in her forties or fifties who had known about her goiter for ten to fifteen years. She had postponed any treatment until the advent of nervousness, palpitation, insomnia, weakness, and perhaps some loss of weight. She had some menopausal symptoms. Many had social and economic problems that could easily cause anxiety neuroses. Physical examination would show some cardiovascular changes, while the basal metabolic rate would be around +30. Were they toxic thyroids?

Many proved to be otherwise. The combined efforts of psychiatrist, physician, and social workers often cleared up the picture so that operation for toxicity was avoided. In our early enthusiasm and ignorance we had promised relief of symptoms by surgery to some of these women, only to have them return to the clinic for years with a multiplicity of complaints.

It has now become our practice to postpone surgery and to try out other means of therapy first. If symptoms persist after reasonable effort has been made, the woman is referred to the ward for rest, iodine, and surgery. Of course, we relieve them of their deformity. At times we have had striking benefit. In others, symptoms have persisted so that we have finally had to conclude that the patient had not been suffering from toxicity at all. They were then classified as nontoxic nodular goiters.

There were 56 patients whose final diagnosis was toxic nodular goiter. Of these, 6 were done in two stages and 50 in one stage, with 6 deaths.

Hyperplastic Diffuse Thyroid Disease with or Without Exophthalmos

There were 218 cases of diffuse enlargement of the thyroid gland with hyperthyroidism. Of these, 150 had exophthalmos. We found them to have the usual symptoms and signs in variable degree. Two were so sick that they died before surgery could be attempted. One committed suicide by jumping out of a window before operation.

Our decision to do an operation in one or two stages was largely determined by the general condition, the duration of the disease, the age, and the weight loss when first seen. If a decision is made to do a two-stage operation, this decision is adhered to no matter how favorable the response of the patient to rest and iodine and no matter how smoothly the patient appears to undergo the operation. We have sincerely regretted the breaking of this rule. On the other hand, we do not hesitate to change from a one-stage to a two-stage procedure if the response has not been satisfactory to rest and iodine and, lastly, if the reaction to the operative procedure does not seem favorable. Three had ligation of the superior thyroid arteries as a first step, while one-quarter (57) had two-stage procedures. There were 4 deaths in 215 patients who were operated upon—1 after a first-stage operation, and 3 after a subtotal one-stage operation.

We speak of surgery as if it were a matter of

course It is our preferred method of treatment, as we have not been favorably impressed with roentgen therapy as a curative procedure for hyperthyroidism in the cases that we have encountered

Persistence of symptoms after operation for toxic nodular goiter and after diffuse hyperplastic thyroid, especially the latter, is frequent enough to warrant radical removal at the time of the primary operation We try to leave only an estimated 3 to 5 Gm of thyroid gland in each lobe after complete removal of the isthmus and pyramidal lobes A small group had persistent symptoms because of inadequate primary surgery in our clinic or elsewhere In general, we have had fewer cases of persistent hyperthyroidism as experience increased and surgeons became more thorough, so that smaller remnants were left We have had 10 Roosevelt Hospital cases that developed a large new gland with renewed hyperthyroidism after such extensive surgery

Much has been written about the "masked" or "apathetic" thyroid We had 13 such patients who were subjected to surgery A few had splendid results, others, only fair We were unable to foretell which ones would have the best response There were no deaths in this group

Recurrent Laryngeal Nerve Injury

We were unable to state exactly the number of recurrent nerve injuries due to the fact that all cases did not have vocal-cord examination before they left the hospital or subsequently We have a record of 14 unilateral palsies and 1 bilateral palsy In 3 we were unable to obtain a follow-up vocal-cord inspection In the other 11, the vocal-cord function had returned in a few weeks to two months after operation

The case with bilateral palsy required a tracheotomy One month later the right vocal cord was normal One year later the left cord was still paralyzed This finding agrees with the reports of others—that usually the palsy is only temporary, due to trauma or ischemia, and rarely due to division of the nerve In recent years, in an effort to avoid injury to the nerve, we have endeavored to visualize the recurrent nerves at operation To do so one must be reminded that the course of the inferior thyroid artery and the recurrent nerve is not that usually described in the textbooks The inferior thyroid artery is first seen coming from behind the common carotid artery and about opposite the middle of

the thyroid lobe It takes either a transverse course or else runs downward and inward The recurrent nerve approaches the thyroid lobe at an angle of about 45 degrees, running inward and upward to meet the inferior thyroid artery where it enters the gland The nerve goes either in front of or behind the artery or between its branches Since we have recognized this anatomy and visualized the artery and nerve, we have fortunately been free of nerve injury We feel that the thyroid resection may be performed with much more safety and assurance

There is one sequel to subtotal thyroidectomy that has often bothered us It is the loss of the ability to sing for a matter of months or permanently The patient has been subjected to operation, convalescence has been uneventful, and, before discharge, a throat examination has demonstrated normal movement of the vocal cords On recall, in response to inquiry, the patient has expressed herself as satisfied with the results of the operation except that she cannot sing as she had formerly Throat examinations have failed to show any reason for such failure

In an endeavor to find some possible cause for such failure, I have speculated upon the influence of injury to the superior laryngeal nerves Frazier and Erb¹ called attention to the fact that "the superior laryngeal nerve supplies the interarytenoid muscles, which are adductors of the posterior ends of the vocal cord Thus, if both superior laryngeal nerves are damaged, there may be partial loss of voice" They were interested in immediate postoperative complications as a result of injury to these nerves A study of the anatomy of the superior pole region shows that these nerves may readily be injured by sweeping an aneurysm needle around the upper pole in tying off the superior thyroid artery I believe, instead, that careful direct hemostasis with clamps should avoid such injury to the nerves and thus preserve complete vocal-cord function

Parathyroid Tetany

There were 5 cases with tetany after operation with typical Chvostek's sign, tremulous tongue, carpal pedal spasm, and low blood calcium Three cleared up in a few days with the use of para-thor-mone and calcium gluconate One persisted for several months after a two-stage secondary operation for recurrence The fifth patient has had symptoms that have persisted in a mild degree for years I previously reported this case²

Mortality

Three patients with hyperthyroidism died in the hospital without surgery. Five hundred and twenty-five patients were operated upon and 13 died.

Operations on 225 nontoxic nodular goiters resulted in 2 deaths with signs suggesting pneumonia.

Operations on 56 toxic nodular goiters resulted in 6 deaths. Their ages were 48, 65, 59, 47, 55, and 54. They had cardiovascular disease, hypertension, and goiters of many years' standing. Four had substernal thyroids. One died an anesthetic death, under avertin and cyclopropane, on the operating room table after thirty-five minutes of anesthesia. Two had first-stage operations only. One should never have been touched because of her bad heart.

Operations on 217 patients with hyperthyroidism resulted in 4 deaths—one after the first stage of a two-stage operation and the other 3 after a subtotal one-stage operation. The one with a death after the first-stage procedure should never have been touched. He was really inoperable. The others went into thyroid storms. The fourth became cyanotic with stridulous breathing and, in the opinion of one competent observer, should have had tracheotomy twelve hours before it was done because of a probable bilateral cord paralysis.

One of the 21 cancer patients died fourteen hours after an extensive subtotal thyroidectomy of "cardiac failure with pulmonary edema."

Surgical Technic

Our surgical procedure is similar to that used in other clinics, especially after our surgeons had had opportunity to develop their skill and judgment with the concentration of cases. We keep the patient in the hospital for ten days to two weeks on iodine with frequent basal metabolism tests. We watch their general condition, their tachycardia, and their weight gain. If these factors are not satisfactory, we do not hesitate to wait longer. Avertin and nitrous oxide anesthesia is used by preference. Silk with no drainage has been the custom in recent years. We believe that the use of silk has reduced the amount of post-operative swelling and the need for drains. The ribbon muscles are divided when necessary because of the bulk of the gland. When two-stage operations are performed we have planned four- to six-week intervals between operations without iodine. After discharge, the

patient is seen at increasing intervals in the clinic.

Summary

1 As a result of cooperation between the physician and surgeon we have avoided many needless operations. As our experience increased, so has this percentage increased. Many a patient with a basal metabolic rate of +30 when first seen is suffering from other than a thyroid disease.

2 The nodular goiter with nervous symptoms is often a difficult problem. The diagnosis of toxic nodular goiter should be made slowly and with caution. When operation is decided upon, careful preparation should be made. Stage operation should be employed if there is any question at all. Our highest mortality was in this group.

3 Operation for diffuse hyperplastic thyroid disease usually gives splendid results. In the follow-up the most striking evidence of proper diagnosis and successful operation is the rapid gain in weight.

4 When this disease is masked as in the so-called apathetic thyroid, the results may be strikingly good but often are only fair. These patients really have more than thyroid disease to contend with.

. . .

The thyroid clinic was organized and continued under the direction of Dr. Evan M. Evans, director of medicine, and Dr. James I. Russell, director of surgery. The following members of the staff have been in attendance at the thyroid clinic during the period covered by this paper: Drs. W. H. Button, Jr., J. A. C. Gray, J. H. Iselin, Jr., R. W. Laidlaw, R. Richards, H. W. Cave, H. A. Patterson, G. P. Pennoyer, and W. C. White.

Discussion

Dr. Alfred H. Noehren, *Buffalo, New York*—Dr. White is to be complimented on the excellent and frank presentation that he has given us. He has shown us the difficulties and failures, as well as the successes, in the handling of thyroid cases.

In the second place, Dr. White and his group at the Roosevelt Hospital are to be congratulated on being among those who have recognized that, inasmuch as the diagnosis and treatment of thyroid diseases involve a number of specialties in medicine, they are best handled by a group of

men that not only represent these specialties but have made a special study of the thyroid gland. To differentiate a toxic thyroid case from the neuroses and other conditions simulating it, to prepare it for surgery, when indicated, to decide when that patient is ready for operation and whether or not to do it in stages, and to supervise the aftertreatment until the patient is restored to health—all these require a thorough study of each individual case and careful judgment. This is too much responsibility for one man to carry and should be shared with others. In my opinion, any surgeon who attempts to handle a toxic thyroid case from beginning to end without any help or advice is foolish.

Neither is it necessary that this group idea be confined to a large hospital, like the Roosevelt Hospital, or to the larger medical centers. It is just as possible and necessary in private practice and in the small community. Any well-trained surgeon in a town that is large enough to have a good hospital ought to be able to find at least one good medical man who would be willing to interest himself in these cases. If they then work up each case carefully, perfect their technic, keep up with the literature, visit clinics, and attend meetings (e.g., meetings of the American Association for the Study of Goiter), they ought to be able to have as good results as are obtained in the larger clinics, for what they lack in a large number of cases they make up in more personal attention to each case.

The classification of thyroid disorders which Dr. White has given us is a good one and, in his hands, probably as good as any. However, there are so many classifications, and no one of them is satisfactory to all (especially to the pathologists), that it would seem desirable that there be some agreement by the various clinics on one certain classification. We have for a long time used that recommended by the American Goiter Association and, clinically, find it satisfactory. It divides all disorders of the thyroid into two large groups, diffuse and nodular. The latter includes all single or multiple adenomas, whether they be fetal, developmental, or malignant. These two groups are each again divided into the nontoxic and the toxic. Thus, we have four groups: (1) nontoxic diffuse, which includes the simple adolescent, the endemic, and the diffuse colloid; (2) toxic diffuse, which is made up almost entirely of exophthalmic goiter; (3) nontoxic nodular, adenomas without toxic symptoms; (4) toxic nodular, those with toxic symptoms. These groups do not include the inflammatory condi-

tions of the thyroid, such as acute and chronic thyroiditis, Riedel's struma, and Hashimoto's disease, but these are easily placed in a group by themselves. If everybody would accept this or some other acceptable classification, then each would know what the other is talking about.

Dr. White speaks of the difficulty of deciding whether a case of supposed toxic nodular goiter is really toxic or not. We have found this difficulty more in the diffuse goiter—as when a patient with a neurosis happens at the same time to have a simple enlargement of her thyroid gland. In these cases, of course, a thyroidectomy is not indicated and only makes the patient worse. But in the nodular goiter, this distinction does not seem as important to us, because we believe, as does Dr. White, that every nodule in the thyroid gland should be removed anyway. Our reasons for this conviction are (1) because it may become toxic or more toxic at any time, (2) because it will probably grow and may cause greater pressure symptoms, and (3) because it has a 2 per cent (according to Dr. White's figures, 4 per cent) chance of becoming malignant. Therefore, any nodule should be removed whether it is toxic or not, but we should be careful, as Dr. White indicates, not to promise too much in the way of a cure of nervous symptoms.

Dr. White has touched slightly on operative preparation and technic. While this has become fairly well standardized, there are nevertheless some variations in the different clinics. We, for example, do not use avertin in our preoperative sedation. It has been proved that hyperthyroidism causes definite liver damage, and, as avertin is excreted by the liver, we are afraid it may further damage an already handicapped liver. We believe we get as good results with large doses of luminal. Neither do we routinely visualize the recurrent nerve, because it takes time, causes scar formation near the nerve, with possible later pressure on the nerve, and may even cause direct injury to the nerve in the very act of searching for it.

However, these are minor details, and each surgeon must use those methods that in his hands give the best results. That brings us back to our original point, the necessity for the careful study of each patient not only by the surgeon but by other interested specialists.

Dr. White's paper has done much to emphasize the importance of this point and for that alone, to say nothing of its many other interesting aspects, is a most important contribution to a better understanding of the thyroid problem.

BOWLING—A M A MEETING

Plans are on foot to have a bowling tournament during the next meeting of the American Medical Association, June 2 to 6, 1941, at Cleveland. It is hoped that teams can be

formed representing various states. Physicians who are interested in bowling should contact Dr. Lewis W. Bremerman, 1709 West 8th Street, Los Angeles, California.

THE PRIVATE PHYSICIAN—AN IMPORTANT LINK IN SCHOOL MEDICAL SERVICE

JACOB H. LANDES, M.D., New York City

THE private physician is an important contributor to the public health program. Public health agencies know that if there is to be better health for the entire nation the practitioner must be a partner. Every physician, especially the general practitioner and pediatrician, can be an assistant health officer. Indeed, it is an axiom that the official health officer, if he is to be an effective force in a community, must have the support of the local medical society and its component membership. Fortunately, the private practitioner, almost without exception when properly approached, is quick to assist the health officer in his public health program. Private medicine has even played a role of leadership in many instances to achieve public health advances.¹

In every day practice, however, the private physician may not think his contribution to the public health program especially dramatic. When he thinks of his role as "assistant health officer," he is apt to think of the routine reporting of data on birth and death certificates or the furnishing of somewhat rather obscure health information for purposes of official record. In fact, as Thomson² said recently, the private physician may only know the public health officer "because of his vexatious reports and statistics," and the health officer, forgetting the trying demands of private practice, may think of the private physician when he demurs about the paper work as an obstructionist. Goodrich³ has suggested that health worlds might be conquered by common understanding and joint efforts of private medicine and public health. He said "We do not understand each other well enough to benefit our people with an adequacy of service comparable with our conjoined abilities in a state of fusion."

What opportunities are there for public health and private medicine to fuse their efforts? The school health program in New York City offers an excellent opportunity. The private practitioner examines many children who enter school for the first time, and he renders essential treatment to school children discovered to have physical defects by the school medical examination. It is the

purpose of this paper to illustrate the part played by the private physician in relation to school medical service in the Washington Heights and Riverside health districts of New York City.

In the New York City health service it is the policy to recommend that newly admitted children be examined by their own physician. During school registration week in September and February, special emphasis is laid on this policy. Principals take an active part. The health department assigns physicians and nurses to the schools for the express purpose of meeting parents and to urge that the child's medical examination and diphtheria immunization be carried out by the family physician. That such a policy brings children to the attention of the family physician can be gleaned from the record of the increasing number of private physicians' examinations in the New York City schools.

In the fall of 1938, 21.5 per cent of the total number of children examined in the schools were examined by private doctors. This percentage rose to 26 in the corresponding term of 1939. In the Washington Heights District the proportion of private physicians' examinations was still greater. In the fall term of 1938, 24.2 per cent of all school examinations were performed by private physicians, and in the corresponding school term of 1939, 511 children, or 29.6 per cent of a total of 1,725 children examined, were examined by private doctors. At the writing of this report, it is evident that the private physicians' examinations in the fall term of 1940 will be still higher.

Cooperation with family physicians is not limited to medical examinations. In the routine medical examinations performed by school physicians, children discovered to have physical defects are referred to their own doctors for consultation and treatment. This is not limited to the Washington Heights District but is part of the general program of the New York City Health Department.

The attempt will be made to describe two special projects that involved private physicians' participation. These were inaugurated in the Washington Heights and Riverside districts and were concerned with the referral of special groups of children to the family phy-

¹District Health Officer, Williamsburg-Greenpoint District, Department of Health.

TABLE 1—DIPHTHERIA IMMUNIZATION STATUS OF 532 CHILDREN—RESULT OF QUESTIONNAIRES ANSWERED BY 336 PRIVATE PHYSICIANS

	Status	Number	Percentage
1	Previously immunized	159	29.9
2	Private physician promised to immunize	207	38.9
3	Children referred to school for immunization	41	7.7
4	Children referred for further check-up	125	23.5
Total		532	100.0

physician for diphtheria protection and medical examination. Without these particular efforts undertaken, the children probably would never have been immunized or examined.

During the latter part of 1938 and the early months of 1939, a special drive was made in New York City to immunize school children under 10 years of age against diphtheria. Children selected for immunization were those never before immunized or those children who had been immunized more than three years prior to the campaign. The children were divided into two groups. The first group consisted of those who had been examined by school physicians, and the second group, of those who in the past had been examined by their family doctors. A number of children had no indication on their medical record card of previous immunization against diphtheria, and their status of immunity was unknown at the time this survey was undertaken. It may be definitely asserted that few, if any, of those children had received a supplementary inoculation, since the Department had, only a short time previously, officially recommended a supplementary injection. In view of the fact that there was a large number of such children who had been previously examined by their own physicians, it was decided to refer to them all children able to pay for necessary immunization. This is in keeping with the department's policy of regarding the private doctor as an active public health worker.

Nurses of the public and parochial schools were asked to obtain the names of such children (1,329) as well as the names of the doctors who examined them. The writer forwarded a questionnaire to each doctor requesting the following information pertaining to the immunization status of the child under investigation:

- (1) Has the child ever been immunized, recently Schick-tested, or immunized within the past three years?
- (2) If the child was not immunized within the last three years and if his Schick

status is unknown, do you wish to immunize that child?

- (3) If the answer to number 2 is in the negative, do you desire the immunization to be done by the school physician?

Of the 1,329 questionnaires forwarded to doctors, 532 or 40 per cent were returned by 336 doctors (Table 1). Of the 532 children, 159 had been recently immunized or had received a Schick test. This was a result of our campaign for diphtheria immunization, which had by that time been in progress for several months. The physicians agreed to immunize 207 children themselves. They further stated that 41 children could not afford to pay for the service and were, therefore, referred to the school physician for immunization. With the balance of 125 children the nurses were asked to contact the parents and refer them to their physicians if the parents were in a position to pay for this medical service.

It is thus clear that, of the replies we received, at least 40 per cent, 207 in number, were referred back to the physician for diphtheria immunization. Most of the 125 children whose statuses were unknown to the doctors were ultimately interviewed by the nurses and many of them referred to the doctors for protection. The school physician administered the injections to those children for whom no response was received from the private physicians, thus assuring the protection of all children.

In keeping with the policy recommended by the American Academy of Pediatrics and also to educate the parents of the value of periodic medical examinations by the family physician, the following project was undertaken:

Because of the limited medical personnel in our school health service, only a small proportion of our elementary school children can receive a medical examination at some time during their school career. The health department policy calls for an examination of newly admitted children and others referred for some special problem by the teacher, principal, or nurse, excluding, of course, children previously examined by private doctors. Many children, therefore, may go through their elementary school career without visiting a physician, unless some special condition arises necessitating an examination. In looking over our school medical cards, we found large groups of children without a record of a previous examination, although some may have been examined in the past at a school other than the one they were then attending.

Eighteen schools, approximately one-half the number in the two districts and covering sections of better economic circumstances, were selected. In those schools we found 1,243 children in the upper grades in whom a medical examination was warranted. Our project of referring children to their private doctors for examination showed promise.

A letter from the health officer was sent to each mother informing her that her child did not have a record of a medical examination since admission to school and urging her to take her child to a doctor for this examination. Included with the letter to the parent was a medical form for the physician to fill out, as well as a short note to the doctor explaining the necessity for a medical examination. This campaign was conducted from April through June, 1940. By the end of June, 455 children, or 36.5 per cent of the total to whom letters were given, had visited their doctors and returned the medical forms filled out. It can safely be said that had not the school term ended, more of these questionnaires would have been returned. However, the balance of the children are being followed up by the

nurses, and many of them will no doubt be examined during the fall school term.

The efforts expended in this campaign proved to be fruitful, particularly since all of the 455 examined were children in the higher grades. Few, if any, would have been examined had the campaign not been undertaken.

Summary

The importance of the private physician in school medical service has been pointed out. Examples where an official health agency has benefited the profession were cited. These included a campaign for the immunization of school children against diphtheria, as well as the examination of upper grade school children by family doctors. Such help to private physicians should be encouraged, since the community, as well as the official health agency, is ultimately benefited.

GOOD ADVICE ON PUBLIC SPEAKING

The Brown Publishing Company, of Blanche, Ohio, recently published some timely tips on public speaking. In view of the fact that an increasing number of physicians are being invited to speak before lay groups, their suggestions are reproduced in the *Pennsylvania Medical Journal*.

Principles

"1 Always know in advance what you are going to say. Avoid nervous habits such as rubbing the chin, fingering the buttons on your coat, etc.

"2 Pause a moment before beginning to talk after you get on your feet. A short purposeful silence always gets attention—it gives the audience a chance to compose itself.

"3 Speak slowly and distinctly—articulate each word—pronounce each syllable correctly. Do not speak too loudly at first—cultivate the easy, but firm delivery.

"4 Talk to your audience in the back of the room—not to the men near you.

"5 Be yourself—don't pose—show by your manner that you know your subject.

"6 Avoid unnecessary repetition. Quote a few facts and figures—they serve to give your words the weight of authority.

"7 Loosen up—practice a few gestures—not too many—to give emphasis to your delivery.

"8 Use dramatic pauses. A pause in the right place is eloquence. It focuses attention and crystallizes interest.

"9 Develop a variety of tempo. Don't

drone or have a sing-song delivery. Give inflection to important thoughts and sentences.

"10 Finish vigorously. Hold up the last sentence and when you have finished, pause a moment, bow slightly—don't say 'thank you'—just quit and sit down.

"11 Allow yourself plenty of time before the date of your address to build up your talk. Jot down all the points you want to cover and arrange them in proper sequence.

"Remember, public speaking is just like making a sales talk to an individual."

Specific Points

"Arrange your talk to get your audience to agree with you—quoting a few facts or figures that your audience knows to be correct will accomplish this.

"1 Introduction. A word or two of local interest—reference to previous speakers or tactfully complimenting the audience.

"2 Tell a story if you have a good one—otherwise this is omitted.

"3 Arguments or opinions.

"4 Climax—put over vigorously with gesture and emphasis in the voice.

"5 Conclusion or summary if necessary. Usually it is best to quit at the end of the climax.

"Avoid reading manuscript—it is monotonous and boring to the average listener.

"Don't attempt to be funny. Earnestness, dignity, and poise are far more valuable than attempting to be a humorist."

THE CLINICAL SIGNIFICANCE OF BACTEREMIA

CHESTER S. KEEFER, M.D., Boston

THE presence of bacteria in the circulating blood is of significance in both diagnosis and prognosis. In the case of such infections as typhoid fever, the diagnosis is frequently established by isolating the typhoid bacillus from the circulating blood. When an organism such as the pneumococcus is found in the blood usually it is of greater importance in prognosis than in diagnosis, since the diagnosis of pneumococcal infection has generally been made before the organism is isolated from the circulating blood.

I propose to summarize the results of a study of 479 cases of bacteremia due to a variety of microorganisms, but, before discussing the clinical significance of bacteremia, it is well to review some of the facts concerning bacteremia in general. When inert particles such as carbon are injected into the blood stream of an animal, they are promptly removed by the phagocytic cells of the body, and they can be found in the reticuloendothelial cells of the liver, spleen, lymph nodes, and other organs. If one injects an avirulent organism into the blood stream, they likewise are removed from the circulating blood by the phagocytic cells and destroyed. However, if a virulent organism is injected into the blood of an animal, a different sequence of events occurs. At first the number of organisms in the circulating blood is temporarily reduced, but they soon increase and the animal dies. At necropsy, one finds numerous organisms in the various organs of the body.

These experimental studies in animals can be duplicated in large part in cases of bacteremia as it occurs in man. Of course, all of you realize that bacteremia in man is not produced by injecting organisms into the circulating blood. Organisms enter the blood stream from various portals of entry by invasion of the lymphatics and capillaries. Once they invade the blood stream they may or may not be cleared, and localized abscesses or metastases may or may not develop, depending upon the balance and summation of a number of factors, such as the location of the primary lesion, the type of infecting organism, and the efficiency of the normal defense mechanism.

Thus, one may see (1) bacteremia—no clearing of the blood stream, rapid death, (2) bacteremia—clearing of the blood stream, recovery without abscess formation, (3) bacteremia—clearing of the blood stream, recovery or death with abscess formation, and (4) bacteremia—no clearing of the blood stream, abscess formation and death.

In general, one can say that in group 1 no antibodies are present. In group 2 the bacteremia is due to a relatively avirulent organism, or there is a temporary invasion of the blood after the rupture of the local defense mechanism. In group 3 the focal infections develop as a result of the development of antibodies, and in group 4 antibodies are present, but the focus of infection is situated in an area where sterilization is difficult or impossible.

With these facts in mind we may now proceed to discuss various features of bacteremia in man which are of significance in both diagnosis and prognosis.

The Significance of Isolating Organisms from the Circulating Blood Without Signs of Localizing Infection

In a certain number of infections bacteria are isolated from the circulating blood without any localizing signs of infection being obvious. Valuable information is obtained concerning the nature and possible local focus of the infection by the identification of the organism. The bacteria which may be found in the blood without any localizing signs of infection are typhoid-paratyphoid bacilli, *Bacillus melitensis*, meningococci, and gonococci, less often the common pyogenic organisms, such as *Streptococcus hemolyticus*, *Staphylococcus aureus*, or *Bacillus coli* are found. *The presence of bacteremia due to the common pyogenic organisms, without local signs of infection, should always suggest an intervascular focus, such as an infective thrombophlebitis or endocarditis.*

Hemolytic streptococcal bacteremia without obvious local signs of infection should suggest (1) thrombophlebitis of the pelvic or the tonsillar veins or the veins of the skull, or (2) endocarditis. I have seen 1 case of hemolytic streptococcal bacteremia arising from an abscess of the aorta and another case in which the focus was an abscess of the spleen, but obviously these are rare. In about 10 per cent

Read by invitation at the Annual Meeting of the Medical Society of the State of New York, New York City, May 9, 1940.

TABLE 1—INCIDENCE AND FATALITY RATES IN BACTEREMIA DUE TO DIFFERENT ORGANISMS

	Total Cases	Percentage Died
Hemolytic streptococcus	250	70
Staph. aureus	122	80
Pneumococcus	54	80
B. coli	40	35
B. Friedländer	10	100
B. influenzae	3	33
Total Cases	479	

of the cases of hemolytic streptococcal bacteremia no local focus is found. Some of these patients now recover without developing local signs of infection following sulfanilamide, and the portal of entry is never found.

Staphylococcus aureus bacteremia without localizing signs of infection usually indicates an infective endocarditis or an osteomyelitis that has failed to produce focal symptoms. Other foci of infection which may be responsible for the bacteremia are located in the kidney, prostate, or muscles.

Pneumococcus bacteremia without pneumonia is seen in (1) osteomyelitis, especially in children, (2) paranasal sinus disease, (3) pneumococcal infection of the peritoneum or biliary passages, especially in patients with a latent cirrhosis of the liver or lipid nephrosis, (4) pneumococcal endocarditis.

Colon bacillus bacteremia without local signs of infection is rare. However, it may be seen in multiple abscesses of the liver following abdominal operations (gastric resection or intestinal resection) and in rare cases of biliary tract disease, endocarditis, or cirrhosis of the liver.

Streptococcus viridans bacteremia occurs most often as a sign of bacterial endocarditis. Aside from this disease, it may be encountered in rare cases of cholangitis (cholangitis lenta), in subacute endocarditis, and in an infected arteriovenous aneurysm. As a transitory phenomenon, *Str. viridans* bacteremia may be seen following tonsillitis, tonsillectomy, or the extraction of teeth. It may also be discovered during the course of many chronic diseases such as rheumatic fever, chronic arthritis, and lupus erythematosus. The interpretation of *Str. viridans* bacteremia, therefore, must be made on the basis of the clinical picture and the local symptoms and signs.

In Table 1 there are presented the incidence and the usual fatality rate in 479 cases of various types of bacteremia. These cases have been studied by me during the past ten years.

Hemolytic Streptococcal Bacteremia—This is the most frequent type of bacteremia en-

TABLE 2—HEMOLYTIC STREPTOCOCCIC BACTEREMIA, 250 CASES

	Total Cases
Portal of Entry	
Throat, middle ear and mastoid	70
Uterus	43
Skin	62
Lungs	20
Others	55
Without Metastases	154
With Metastases	
Arthritis	49

Endocarditis	11
Osteomyelitis	4

countered in medical practice. The organisms enter the blood most often from (1) the middle ear and mastoid process, including the lateral sinuses of the skull, (2) the uterus, (3) the skin and subcutaneous tissues. Prognosis is always grave, since without chemotherapy the fatality rate is 70 to 75 per cent. Metastases are present in only about 40 per cent of the cases, and they occur most often in the joints, subcutaneous tissues, and endocardium. Other less common sites for metastases are the bones and the lung. When spontaneous recovery follows bacteremia, there is usually only a transitory invasion of the blood from a focal lesion, or the blood is cleared of organisms and focal infection is established. Complete recovery commonly follows the treatment of the local lesion surgically, with or without the use of chemotherapy. Death occurs among patients with debilitating diseases, in those with rapidly spreading infection without localization, and in those in whom localization occurs in an area which cannot be treated surgically—that is, in the peritoneum, endocardium, or meninges. The portal of entry and the distribution of metastases in 250 cases of hemolytic streptococcal bacteremia are shown in Table 2.

Staphylococcus Aureus Bacteremia—This type of bacteremia is second in order of frequency when all organisms are considered. Here, again, the prognosis is grave since the fatality rate is usually in the neighborhood of 80 to 85 per cent. The common portals of entry for the *Staph. aureus* are (1) the skin, (2) the respiratory tract, (3) the bones, and (4) the genitourinary tract, including the uterus. *Staph. aureus* bacteremia is seen most often during the second decade, when lesions of the skin, the respiratory tract, and bones are common portals of entry. Metastatic lesions are frequent and occur in about 82 to 85 per cent of all cases. In 10 per cent of the cases there is direct extension of infection from the primary focus to neighboring organs,

Meningitis	7		
Fatality Rate			81.9
Under 40 years			75.0
Over 40 years			97.5

such as the middle ear, mastoid, and lateral sinuses of the skull, in the remainder, metastases occur in various organs of the body. Abscesses of the lungs, superficial abscesses of the muscles, osteomyelitis, and arthritis are frequent. Indeed, abscesses may occur in many organs during the course of this type of sepsis. As a rule, the patients have high, remittent, irregular fever with leukocytosis, and organisms are isolated from the blood with ease. When patients die without developing foci of infection, the course is usually rapid and lasts less than ten days. A few of the important facts concerning these cases are summarized in Table 3.

Pneumococcic Bacteremia—The finding of pneumococci in the circulating blood is most frequent in patients with pneumococcic lobar pneumonia, and between 25 and 40 per cent of all patients with pneumococcic pneumonia develop bacteremia at some time during the course of their disease. In addition to the cases of pneumococcic bacteremia in pneumonia, there are instances in which pneumococci are found in the circulating blood without a preceding pulmonary infection. In the vast majority of these cases the organisms invade the blood from the throat, middle ear, or mastoid process, and only rarely from such foci of infection as a cholecystitis, infection of the biliary passages, or a pyelonephritis. In a certain small number, there is no obvious portal of entry.

Insofar as bacteremia in pneumonia is concerned, the following facts are of considerable importance and interest. Bacteremia increases in frequency with advancing age, so that it is about three times as frequent over the age of 40 as under 40. Regardless of the day of illness on which it is detected, bacteremia is always of serious importance, since the

fatality rate is three to four times as high in bacteremic patients as it is in those without bacteremia. While it is always of serious prognostic importance, more patients recover with bacteremia under 40 years of age than over. There is some difference in the frequency with which various types of pneumococci invade the blood. For example, types II, V, and I are encountered most often and types III, VII, and VIII, less frequently. The highest fatality rates with bacteremia are seen in types III, VII, V, I, II, and VIII, respectively. Often, bacteremia is seen in those who have multiple lobes involved, leukopenia, severe abdominal distension, deep cyanosis, delirium, and pulmonary edema. It is much less frequent in patients who are treated with specific antipneumococcus serum, sulfapyridine, or sulfathiazole.

The fatality rate in bacteremic patients who do not receive specific treatment varies between 50 and 100 per cent, depending upon the type of pneumococcus, age of the patient, and other associated factors. In general, it can be said that, of the bacteremic patients recovering without specific treatment, the number of colonies of pneumococci in the blood is generally less than 10 per cubic centimeter. If the number of colonies increases in successive blood cultures or if the blood culture is positive more than once, the prognosis is worse than if there is a single positive blood culture with a small number of organisms. By and large, most patients who have bacteremia with pneumococcic pneumonia do not develop metastatic foci of infection. They either die before a sufficient time elapses for suppuration to take place or the blood is cleared of organisms and recovery follows. When metastases occur, however, they are found most often in the subcutaneous tissues, in the meninges, in the endocardium, and less often in the joints. *Repeatedly positive blood cultures due to the pneumococcus following pneumonia or serum treatment should always lead one to suspect an active, vegetative endocarditis or meningitis or both.*

When pneumococcic bacteremia is present without a preceding infection of the lung, one usually finds that the portal of entry is in the mastoid process or middle ear, rarely in the biliary tract or the paranasal sinuses. One curious thing is the high frequency of pneumococcic bacteremia in patients with hepatic cirrhosis and in the nephrotic syndrome. Bacteremia occurring without signs of localizing infection, then, should always lead one to suspect some underlying disease of the liver.

Bacillus Coli Bacteremia—The normal habitat of the colon bacillus is in the gastrointestinal tract. Once the organisms leave this region and localize in such organs as the kidney or uterus, they frequently set up a suppurative lesion. *B. coli* bacteremia is less frequent than that due to other common pathogens. The chief portals of entry are the urinary tract, the female genital tract, the intestinal tract, and the biliary system. It occurs most often in women during the child-bearing period, i.e., between 20 and 40 years of age, and in men during middle and old age, i.e., between 40 and 70 years of age. This corresponds to the increased incidence of *B. coli* infections of the genital and urinary tract during these age periods in women and men, respectively. In only about one-third of the cases is the invasion of the blood a spontaneous one, since in the remaining cases a rupture of the local defense mechanism, usually by operative manipulation, is a factor preceding, and possibly initiating, the blood-stream invasion. Metastatic lesions are infrequent and occur in about one-fifth of the cases. They are seen especially in the cases of genital tract infection, and the lungs and kidneys are the two organs showing signs of metastatic infection. The fatality rate is about 30 to 35 per cent, and of chief importance in prognosis is not the bacteremia itself but rather the extent, severity, and location of the primary focus.

Miscellaneous Types of Bacteremia *Friedländer's Bacillus*—Bacteremia due to the Friedländer bacillus usually comes from a focus in the lungs, biliary tract, or kidney. Metastases and secondary waves of bacteremia have been seen following infections in the bones, joints, and other organs. Temporary waves of bacteremia follow the rupture of the local defense mechanism in the urinary or biliary tract. Much less commonly, spontaneous waves of bacteremia come from liver abscesses, pyelophlebitis, and renal tract infections. The presence of these organisms in the blood always suggests liver abscesses, renal infections, or pulmonary disease. Examination of the lungs and urine often establishes the portal of entry.

Comment

In this discussion I have outlined the relative frequency of bacteremia due to various organisms, and I have discussed those factors in experimental bacteremia which bear on the problem in man. From a study of immune reactions in man with bacteremia, certain facts

emerge which aid in understanding both the mechanism of bacteremia as well as the mechanism of recovery and the indications for proper treatment. It is well to stress the fact once again that bacteremia is an indication of the loss of equilibrium between the normal clearing mechanism of the body and the local defense mechanism. Usually it indicates an absence, or at least a very low titer, of antibody in the circulating blood and an active local focus of infection. When metastatic foci of infection appear, this may be taken to be evidence for the presence of antibody or a strong local defense mechanism. In any patient with bacteremia, measures of benefit should be directed along three lines: (1) to attack the primary focus, (2) to aid in the clearing of the blood stream, and (3) to assist in the destruction of the organisms. At present, this is possible in the case of many infections by means of combined specific serum and chemotherapy. It is well to recall that specific serum therapy slows up the growth of organisms and, in the case of gram-positive organisms, prepares them for phagocytosis and destruction. Chemotherapy with the sulfanilamide compounds causes death of small numbers of organisms, but their principal action is to decrease the rate of growth and allow the body ample time to mobilize the defense mechanisms of the body. In the case of specific serum the beneficial action begins immediately after exposing the organisms to serum, whereas, in the case of chemotherapy the action is maximal only after the organisms have been in contact with the drug for at least six to eight hours.

It is well, then, in any patient who has bacteremia, to use chemotherapy and, when it is available, to use specific serum therapy as well. In this way the body is provided with additional forces to combat infection.

Conclusions

The clinical significance of bacteremia has been reviewed, and the characteristics of the common types of sepsis have been outlined.

Bacteremia is always an index of a serious infection, and it is of great value in assessing the outcome in individual cases.

Microorganisms do not multiply in the circulating blood but usually are present as an overflow from various foci of infection. It is necessary, therefore, to aid the body in the destruction of organisms by (1) removing the primary focus and (2) increasing the efficiency of the defense mechanism by adding specific immune serum and chemotherapy.

Discussion

Dr Ward J MacNeal, *New York City*—This paper of Dr Keefer is timely—first, because of an increasing interest in infections of the blood stream largely as a result of important newer additions to our means of dealing with these conditions, and, second, because of the confusion with regard to these infections in the minds of many recent graduates in medicine, due in great part to the inadequate or misleading statements found in the sections on bacteremia, septicemia, and infections of the blood stream in some modern textbooks. One may grant that the word septicemia belongs to the clinician and signifies blood poisoning or corruption of the blood, however definite or indefinite may be the ideas expressed by these terms. On the other hand, the terms bacteremia and infection of the blood stream belong to the more modern biologic era and signify the actual presence of microorganisms in the fluid tissue known as the blood.

The diagnosis of blood-stream infection rests upon (1) clinical observation of fever with or without chills and especially metastatic localizations of infection which have evidently resulted from transport of microbes through the circulating blood, (2) microscopic demonstration of the microorganisms in the blood, (3) positive blood culture, and (4) positive transfer of the infection by inoculation of blood. The evidence in one category may be convincing even without other support.

Personally, I feel unable to acquiesce in the broad statement that microorganisms do not multiply in the circulating blood. I believe that dividing forms of microbes have been reliably identified in the blood in tertian and quartan malaria of human adults, and I have preparations showing dividing forms of estivo-autumnal parasites in the erythrocytes of children. Dividing forms of trypanosomes are abundant in the blood plasma of infected animals and are seen also in human trypanosomiasis. None can seriously doubt the active multiplication of spirochetes in the blood in relapsing fever and in the early secondary stage of syphilis. In chicken cholera of fowls and in bubonic plague and anthrax of mammals, including man, the proliferation of bacteria in the blood stream can hardly be questioned. Pepper and Farley have observed the meningococcus and also the staphylococcus within leukocytes of the circulating blood of man, and in 3 cases of staphylococemia I have made similar observations. The cocci within the leukocytes present the appearance of dividing forms.

We can agree in recognizing a stage of infection in which the microbes have been driven out of the circulating blood but still persist in certain locations in the body, and we can agree that there is an intermediate stage when the microbes are about to disappear from the circulating blood and would be quickly eliminated if further invasion of the blood from stationary foci could be prevented. At this stage the removal of such

foci hastens the recovery, sometimes in a dramatic fashion. Discretion in such cases, however, should not be neglected.

Dr Frank L Meleney, *New York City*—I am sorry to say that I did not have the opportunity of reading and studying the paper as it was presented by Dr Keefer. My comments must, therefore, be extemporaneous, although I would first like to give you some idea of my conception of the pathogenesis of septicemia.

When bacteria enter the physiologic interior of the body, the actual number is probably small—tens, scores, perhaps hundreds, but not thousands or millions. They are usually introduced through a break in the surface either of the skin or the mucous membrane which serve as the primary defenses of the body. They are then surrounded by dead or injured tissue or foreign bodies. Many of them are not in a favorable growth phase to adapt themselves to the new environment, and they fail to grow and metabolize and are destroyed by the phagocytes which are attracted to the site of the injury. A few of them, however, find the environment suitable for their metabolic activities, and they may be protected from the local defenses by the injured tissue or by the foreign bodies. They proceed to multiply, form a colony, and produce their poisons. These poisons may attract or repel the phagocytic wandering cells, or they may liquefy the dead tissue or kill or injure living tissue. If leukocytes are attracted, the organisms may be phagocytized by them. Sometimes they are killed by the phagocytes, and sometimes they continue to grow within the phagocytes until the bacterial colony breaks the cell membrane and destroys the cell. Sometimes they are carried into the lymph system or the blood vessels by the phagocytic cell. If they gain entrance into the former, they may be filtered out by the lymph glands and either be destroyed in the glands or continue to grow and break down the gland tissue and thus form a metastatic focus. If they gain entrance with a phagocyte into the blood stream, they may be destroyed there or may be carried to other parts of the body, be caught, and be destroyed by the endothelial phagocytes or start a new focus in some capillary channel in some favorable location.

If they are not carried by phagocytes but continue to grow at the site of entrance, they sooner or later come into contact with lymph or blood capillaries. The colony is surrounded by a concentrated zone of bacterial poison which acts upon the surrounding tissue but is diluted and to some extent carried away by the circulating fluids. This gives rise to general symptoms of intoxication. Individual organisms in the periphery of the colony are also subject to the movement of the circulatory lymph and may be carried away by it. This fluid makes its way into the lymph system, but the organisms are temporarily checked by the closed system of the

endothelial membranes. It may be that individual organisms are carried in between the endothelial cells with the fluid, or the organisms may multiply and start a new colony on the outer surface of the capillary wall. Sooner or later, the poison produced by the main colony or the secondary colony of bacteria acts upon the capillary wall. It may either liquefy it or produce an inflammatory reaction resulting in closure of the capillary wall or clotting of the fluid within it. The same effect is produced on larger vessels, venules, and arterioles. As the process advances, the larger veins and arteries become thrombosed and then liquefied, a sterile portion of clot progressing in both directions ahead of the infection and liquefaction.

When the clot reaches a large vessel it may break off and be carried peripherally, if that vessel is an artery, or centrally if it is a vein, and may be filtered out by some capillary too small to let it pass. If the clot is small and sterile, nothing of importance happens. If it is large enough, it may mechanically cause local gangrene or even death—for example, a large pulmonary embolus. If the clot contains bacteria, it may produce another focus of infection from which the process may be repeated.

It is not surprising, therefore, that from any infected focus, either primary or secondary, there is a constant entrance of bacteria into the blood stream, either as individual organisms or incorporated in a blood clot. The number will depend to a considerable extent upon the virulence of the organisms, their ability to multiply within the area of infection, and the potency of their toxins to kill or injure tissue.

When a blood culture is taken from a peripheral vein at the elbow, any organism that is recovered has passed the gauntlet of the lung capillaries and the capillaries of the periphery of the forearm or hand. The lungs filter out most of the embolic clots, and the endothelial cells pick up the individual organisms. If an attempt is made to determine the number of organisms per cubic centimeter of the peripheral blood by means of agar pour plates, we find that even extremely sick patients seldom yield more than 100 colonies per cubic centimeter of blood. This is a surprisingly small number if one considers that an ordinary twenty-four-hour broth culture of bacteria has anywhere from one to five billion organisms per cubic centimeter.

The presence of bacteria in the blood stream is simply an indication of what is going on around the distributing focus. The continued presence

of bacteria in the blood indicates that the focus is distributing organisms faster than the clearing mechanism can take care of them.

With regard to Dr. Keefer's paper, I note first that his mortality figures seem to indicate that his cases were largely those treated before the recent advent of the sulfanilamide group of drugs. This applies particularly to the hemolytic streptococcus and the pneumococcus figures of 70 and 80 per cent, respectively. I believe that it is the experience of all of us that these two types of bacteremia have been considerably lowered by sulfanilamide and sulfapyridine, respectively, and more recently by sulfathiazole. I would like very much to know whether Dr. Keefer has any figures for those cases that were treated with these drugs.

With regard to the staphylococcal bacteremia, his figure of 82 per cent closely corresponds to our figure of 81.4 per cent previous to our use of staphylococcal bacteriophage. In our cases treated with bacteriophage our total mortality of the last six years has been reduced to 46 per cent, and in the last two years, using doubly potent bacteriophage made in our own laboratory, the figure has dropped to 28 per cent. I believe that in bacteriophage we have an effective agent that should be used in all staphylococcal septicemias. This may be further reduced by combining bacteriophage with sulfathiazole.

I would like to ask Dr. Keefer what he means by the breakdown of the local defense mechanism and how he demonstrates the antibodies in the blood of the patient. With all of the surgical organisms that produce septicemia we have little evidence that the body is able to build up any effective immune substances or develop any lasting immunity except for the typhoid bacillus. In many cases we are not able to demonstrate any evidence of any agglutinins in the serum. For the same reason it seems to be difficult to develop artificially any potent immune serum in animals, either for the hemolytic streptococcus or the staphylococcus, and the clinical use of serums in these two types of infections have been, for the most part, disappointing. There has been some evidence recently, however, that rabbit serum may be prepared in such a way as to contain certain antibacterial antibodies against the staphylococcus. This, however, will have to be confirmed by larger clinical experience.

I appreciate the opportunity given me for discussing Dr. Keefer's paper, and I want to thank him for his presentation.

HITHER—WHITHER?

Smith: "So your son is in college? How is he making it?"
 Doctor: "He isn't. I'm making it and he's spending it."—*Ill Med J*

AMERICAN HEART ASSOCIATION, INC

The seventeenth Scientific Meeting of the American Heart Association will be held May 30-31, 1941, at the Hotel Statler, Cleveland, Ohio.

ILEOCOLOSTOMY WITH EXCLUSION IN THE TREATMENT OF REGIONAL ILEITIS

RALPH COLP, M D , and LEON GINZBURG, M D , New York City

THE efficacy of short-circuiting procedures in causing a recession of inflammatory lesions of the bowel has been known for years. Some of the earliest cases of intestinal granulomas reported in the literature were those in which the disappearance of supposedly inoperable neoplasms had occurred following such operations. With the recrudescence of interest in localized inflammatory lesions of the bowel in the past decade, it might be expected that this procedure would have recovered some of its original popularity. Perusal of the literature, however, indicates that the use of ileocolostomy with exclusion as a definitive therapeutic measure in the most common of such diseases, i.e., regional ileitis, is viewed with considerable reserve.¹ The most optimistic statements² concede a 50 per cent success with this method. The following communication is based upon a study of 22 cases of regional ileitis operated upon on the various services of the Mount Sinai Hospital. Most of these cases have been reported elsewhere in discussion of other phases of this disease. We have felt, however, that it would be valuable to study, as a group, those cases in which ileocolostomy with exclusion had been performed. It might be advisable to state that by the term "regional ileitis" we indicate those cases where the inflammatory disease is limited to the distal ileum. Cases in which both ileum and the right colon are involved are not considered in this group.

Before discussing our own experience with this procedure, it might perhaps be advisable to examine the objections voiced against it. In the first place, the point has been raised that unless resection is practiced the nature of the lesion remains unknown. This contention probably had a considerable degree of validity before the nature of regional ileitis was understood. As a result of the resections that were performed during that period, it became possible to correlate a mass of operative clinicopathologic and radiologic observations. Today, a sufficiently clear picture has emerged to permit of a clinical and operative diagnosis of the above condition with a high degree of accuracy.

A number of objections to the operation of ileocolostomy with exclusion have been predicated upon, supposedly disadvantageous mechanical and functional states supervening upon the operation per se. It has, for instance, been argued that the distal excluded end might "blow out" following transection of the ileum because of obstruction beyond it. The fear has also been expressed that the loop of excluded colon between the site of the lesion and the enterocolostomy might become distended and ulcerate as a result of retrograde passage of stool and resultant stasis. In a previous communication³ we have reported clinicoradiologic and operative studies of 32 cases of various types upon whom ileocolostomy with exclusion had been performed. The conclusions drawn were:

1 Obstruction and dilatation of the distal excluded ileum do not occur.

2 Although there is retrograde passage of ileal contents into the excluded segment of colon, there is no abnormal distention, dilatation, or ulceration of this loop.

3 The operation of ileotransverse colostomy or ileosigmoidostomy with exclusion does not in itself produce symptoms. Recurrence of symptoms has been found due to recurrence of the disease proximal to the anastomosis when the original operation was undertaken for disease of the small intestine. In cases in which the operation was performed for the localized type of colitis, symptoms have been found to be due to either persistence of the disease in the excluded loop of colon or its extension distally.

A factor of real moment which has probably contributed materially to dissatisfaction with enterocolostomy is the fact that it has frequently been practiced in continuity without simultaneous division of the bowel distal to it. Without such a complete exclusion there is of necessity only partial diversion of the fecal stream, and optimal conditions for healing in the affected segment are, therefore, not obtained. If, in addition, fistulas, either internal or external, are present, these will continue to discharge intestinal contents. Furthermore, in the presence of even a partial obstruction distally, an accumulation of intestinal contents that had passed by the stoma might occur with the development of a distended loop be-

tween the stoma and the diseased bowel (Fig 2) Such a loop may itself be the cause of new and severe symptoms This possibility, which has been emphasized by Estes and Holm,^{1,2} has been observed by us twice in the course of secondary operations

In the present communication we desire to report especially the effects of enterocolostomy with complete exclusion by division (Fig 1) upon regional ileitis In our experience the results following this procedure have been roughly on a par with those obtained after

FIG 1 Ileocolostomy with exclusion by complete division of the bowel.

resection and have been accompanied by a lower mortality. In the 22 cases here reported this operation has been performed without a mortality While it is true that series of resections for regional ileitis with low mortalities have been reported, it should be noted that these reports are from large clinics with extensive material It is doubtful whether such results could be uniformly paralleled where no such opportunities for familiarity with the complex and varied gross pathologic anatomy of the disease is afforded Although many resections may be easily performed, the truly formidable difficulties encountered at times will almost certainly lead to disastrous experiences Ileocolostomy with exclusion is an indirect and much simpler procedure It obviates the necessity for widespread dissection with the attendant dangers of injury to adjacent, and often densely adherent, viscera It also reduces the likelihood of peritonitis from inadvertently breaking into encapsulated

FIG 2 Ileocolostomy in continuity without exclusion. This figure indicates how intestinal contents will pass by the stoma and discharge through the fistula It also indicates the manner in which a dilated loop may form between the area of disease and the stoma

FIG 3 Indicates how fresh areas of disease may appear at the stoma and proximally or as a "skip lesion." As indicated such extension may occur either following resection or simple exclusion The area marked "Resected segment" corresponds to the segment which would be left excluded. The most proximal lesion is a "skip lesion."

purulent foci It can be carried out with a negligible mortality, even by surgeons who only rarely encounter this condition

Before discussing the effectiveness of the procedure under consideration, a certain confusion of thought and terminology should perhaps be clarified Symptoms following ex-

clusion may, in the first place, be due to failure of recession of the previously demonstrable pathologic process in the excluded loop of bowel distal to the anastomosis. Such a condition must be regarded as a persistence, or, if there has been a transient recession, a recurrence of the disease. On the other hand, recurrence of symptoms following either exclusion or resection may be due to the appearance of fresh areas of disease proximal to the site of such exclusion or resection, i.e., in bowel previously not demonstrably involved (Fig 3). In such a case it would probably be more correct to speak of proximal extension or progression of the disease. If exclusion is to rival resection as a definitive form of therapy, it must be shown that distal recession occurs in a high percentage of cases. In addition, it must be demonstrated that proximal progression occurs with no greater frequency in one than in the other. Incidentally, our own belief is that proximal extension depends on facts, *q v*, other than the type of operation undertaken for the cure of the originally demonstrable lesion.

A. Effect of the Excluded Diseased Distal Loop

For a short-circuiting procedure to be effective there must be an inherent tendency for healing of the intestinal lesion to occur. That such a tendency is present in regional ileitis is attested by the marked fibroplasia encountered even in early stages of the disease, a process that in the later stages gives rise to a marked hypertrophic, fibrotic, stenosing lesion. Such a priori hopes are in our opinion largely justified by the results obtained in this series. Of the 22 cases in which the operation was performed, we feel that 1 case should be excluded, as we would not perform this procedure in that type of case today. This patient (Case 7) had an ileosigmoidal fistula in which barium enema revealed a wide communication with the diseased small bowel. Following ileocolostomy with exclusion there was retrograde passage of stool from the sigmoid into the ileum. This stool was then discharged from an abdominal fistula. In this case the operation was a failure, and we believe that in cases where a large ileosigmoidal fistula is present enterocolostomy with exclusion cannot be depended upon to give a good result. In the remaining 21 cases a definite regression of the disease was observed in 19. Two cases were classified as failures, even though in these 2 there was marked improvement (Cases 1 and 2). In the first case

there was recurrence of intraperitoneal inflammatory signs and enlargement of an intra-abdominal mass which had never undergone complete recession. It is important to note that this patient had, nevertheless, gained over 40 pounds in weight and has lost her intestinal symptoms. In Case 2 there were periodic recurrent attacks of pain and fever followed by a mucoid discharge from a recurring abdominal fistula. It is worthy of note that neither of these cases manifested enteritis or obstructive symptoms. We wish to emphasize that the appearance of such symptoms should lead to a careful investigation of the bowel proximal to the anastomosis rather than to attributing them to persistence of the disease in the excluded loop.

In the remaining 19 cases where the results are classified as satisfactory, complete pathologic examination of the excluded loop was possible at a later date in 3 cases (Cases 3, 4, and 5). These showed definite gross and microscopic evidences of healing. In another case (Case 6) operative inspection of the excluded loop showed unquestionable evidence of healing in the bowel and mesentery and a spontaneous closure of previously existing fecal fistulas. In 15 other cases where no subsequent direct examination of the excluded bowel was made, the beneficial effects of the operative procedure as judged by the post-operative clinical course and follow-up were impressive.

(1) *Fever*—In patients who had been running a febrile course, sometimes over a prolonged period, there was a subsidence of such fever as a rule within two weeks.

(2) *Enteritic Symptoms*—Relief of severe enteritic symptoms was complete in many cases at the time of discharge from the hospital. In some patients it took a few months for the stool to become solid in character. This phenomenon has, however, also been encountered following resection with enterocolostomy. Persistence of severe enteritic symptoms or their recurrence after a free interval was found to be due to proximal extension of the disease in the 2 instances (Cases 4 and 6) in which it occurred. The fear that the excluded bowel might act as a reflex source of enteritic symptoms has not been confirmed in our experience.

(3) *Obstructive Symptoms*—These were invariably relieved by short-circuiting operations.

(4) *Fistulas*—In 5 out of 6 cases of abdominal fecal fistulas, purely ileal in origin, discharges ceased completely. In 1 instance (Case 2) intermittent mucoid discharges oc-

curred In 1 case (Case 7) where a large ileosigmoidal fistula communicated with an abdominal fecal fistula, the operation was a failure As stated above, we do not think that the operation under discussion is indicated in such a case

(6) *Intra-abdominal Masses*—In all but the case of persistent disease recorded above (Case 1), masses regressed both as to size and tenderness In thin people a small residual mass without any pain or tenderness could at times be palpated even after all symptoms had disappeared

(6) *Nutrition*—This was markedly improved except in such cases where proximal extension occurred Some of the patients gained enormously in weight, gains of as much as 50 to 60 pounds being recorded

B The Relation of Proximal Extension or Progression of the Disease to the Type of Operation Performed

Before discussing this phase of the problem, certain of the pathologic peculiarities of regional ileitis should be emphasized First, as is well known, so-called "skip areas" are frequently encountered in this disease At times a few feet of such normal bowel may intervene between two definitely diseased segments Unless thorough exploration, well proximal to the obviously diseased distal segment, is performed, the highest of these lesions may be overlooked Recurrence of symptoms following failure to detect such an additional lesion must be charged to improper application of the operation performed, whether it be either exclusion or resection, rather than to the lack of efficacy of the procedure itself

Another point worthy of note is that the degree of pathologic alteration in regional ileitis is not simultaneously uniform throughout the various affected segments of bowel In the same case all gradations of disease, from the most advanced to the relatively minor, may be encountered Continued experience has led us to suspect that at the time of operation disease may also be present in segments of bowel so minor in degree that they are simply not demonstrable clinically or operatively Progression of such lesions, which are as a rule proximal to the main area of disease and, therefore, above the site of the division or resection, may, however, give rise to symptoms at a future date

The theory has been advanced by some authors that such proximal progression of the disease is more likely to occur following exclusion than following resection⁴ The ex-

cluded loop of bowel is regarded as a focus from which there is extension of disease to more proximal segments of bowel by way of the mesenteric lymphatics Certain observations would, however, appear to militate against this conception In the first place, higher segments of bowel have later become diseased even when resection of all demonstrably diseased bowel and its accompanying mesentery was performed (Cases 4, 5, and 8) Thus, in 3 out of 13 resections performed at this institution, such involvement of proximal segments occurred In addition, 2 cases where resection had been performed elsewhere appeared at this hospital with similar findings Such proximal extension was noted only once in the present series in which the operation was limited to exclusion This relative preponderance of the development of proximal disease following resection is probably purely fortuitous On the other hand, a minor contributing factor may be the fact that when a simple exclusion is performed there is a greater tendency to place the anastomosis higher than if a segment of apparently normal bowel has to be resected

That the condition of the excluded loop is not the determining factor in proximal progression is suggested by two other observations First, in 1 case (Case 6) healing of an excluded loop with closure of fistulas was observed at a secondary operation, with an active lesion commencing 3 or 4 feet proximal to the site of division and anastomosis Similarly, in another patient (Case 4) an excluded loop that was presumed to be the cause of recurrent symptoms was resected and found to present incontrovertible evidence of healing At this operation, exploration of the stoma and bowel proximal to it revealed no evidence of involvement At a still later date, however, disease became radiologically and operatively demonstrable in this proximal segment Conversely, in 2 cases where anastomosis and exclusion failed to cause recession of disease, there was no evidence of the presence of fresh areas of involvement in higher segments

The conclusion to be drawn, in our opinion, is that the important factor in preventing proximal progression is dependent upon choosing the segment high enough so that it will lie proximal to all potential diseased areas Unfortunately, in our present state of knowledge it is impossible to determine accurately the site It must also be noted that there are certain types of cases, fortunately relatively few, in which the disease extends so high in the bowel that all surgical therapy proves useless,

clusion may, in the first place, be due to failure of recession of the previously demonstrable pathologic process in the excluded loop of bowel distal to the anastomosis. Such a condition must be regarded as a persistence, or, if there has been a transient recession, a recurrence of the disease. On the other hand, recurrence of symptoms following either exclusion or resection may be due to the appearance of fresh areas of disease proximal to the site of such exclusion or resection, i.e., in bowel previously not demonstrably involved (Fig. 3). In such a case it would probably be more correct to speak of proximal extension or progression of the disease. If exclusion is to rival resection as a definitive form of therapy, it must be shown that distal recession occurs in a high percentage of cases. In addition, it must be demonstrated that proximal progression occurs with no greater frequency in one than in the other. Incidentally, our own belief is that proximal extension depends on facts, *q v*, other than the type of operation undertaken for the cure of the originally demonstrable lesion.

A. Effect of the Excluded Diseased Distal Loop

For a short-circuiting procedure to be effective there must be an inherent tendency for healing of the intestinal lesion to occur. That such a tendency is present in regional ileitis is attested by the marked fibroplasia encountered even in early stages of the disease, a process that in the later stages gives rise to a marked hypertrophic, fibrotic, stenosing lesion. Such *a priori* hopes are in our opinion largely justified by the results obtained in this series. Of the 22 cases in which the operation was performed, we feel that 1 case should be excluded, as we would not perform this procedure in that type of case today. This patient (Case 7) had an ileosigmoidal fistula in which barium enema revealed a wide communication with the diseased small bowel. Following ileocolostomy with exclusion there was retrograde passage of stool from the sigmoid into the ileum. This stool was then discharged from an abdominal fistula. In this case the operation was a failure, and we believe that in cases where a large ileosigmoidal fistula is present enterocolostomy with exclusion cannot be depended upon to give a good result. In the remaining 21 cases a definite regression of the disease was observed in 19. Two cases were classified as failures, even though in these 2 there was marked improvement (Cases 1 and 2). In the first case

there was recurrence of intraperitoneal inflammatory signs and enlargement of an intra-abdominal mass which had never undergone complete recession. It is important to note that this patient had, nevertheless, gained over 40 pounds in weight and has lost her intestinal symptoms. In Case 2 there were periodic recurrent attacks of pain and fever followed by a mucoid discharge from a recurring abdominal fistula. It is worthy of note that neither of these cases manifested enteritis or obstructive symptoms. We wish to emphasize that the appearance of such symptoms should lead to a careful investigation of the bowel proximal to the anastomosis rather than to attributing them to persistence of the disease in the excluded loop.

In the remaining 19 cases where the results are classified as satisfactory, complete pathologic examination of the excluded loop was possible at a later date in 3 cases (Cases 3, 4, and 5). These showed definite gross and microscopic evidences of healing. In another case (Case 6) operative inspection of the excluded loop showed unquestionable evidence of healing in the bowel and mesentery and a spontaneous closure of previously existing fecal fistulas. In 15 other cases where no subsequent direct examination of the excluded bowel was made, the beneficial effects of the operative procedure as judged by the post-operative clinical course and follow-up were impressive.

(1) *Fever*—In patients who had been running a febrile course, sometimes over a prolonged period, there was a subsidence of such fever as a rule within two weeks.

(2) *Enteritic Symptoms*—Relief of severe enteritic symptoms was complete in many cases at the time of discharge from the hospital. In some patients it took a few months for the stool to become solid in character. This phenomenon has, however, also been encountered following resection with enterocolostomy. Persistence of severe enteritic symptoms or their recurrence after a free interval was found to be due to proximal extension of the disease in the 2 instances (Cases 4 and 6) in which it occurred. The fear that the excluded bowel might act as a reflex source of enteritic symptoms has not been confirmed in our experience.

(3) *Obstructive Symptoms*—These were invariably relieved by short-circuiting operations.

(4) *Fistulas*—In 5 out of 6 cases of abdominal fecal fistulas, purely ileal in origin, discharges ceased completely. In 1 instance (Case 2) intermittent mucoid discharges oc-

were probably due to distention of the excluded loop and its evacuation via the fistula

Case 3—D D (Lewisohn²) was admitted to the hospital complaining of lower abdominal pain, especially after meals, for six weeks. X-ray revealed a lesion involving the terminal 8 inches of ileum. Operation revealed involvement of the terminal 6 to 8 inches by an inflammatory process presenting a typical picture of regional ileitis. The terminal ileum was divided between Payr's clamps about 18 inches from the ileocecal junction and an ileocolostomy performed. Four months later the patient was readmitted for a routine second-stage procedure. The lower abdominal pain had disappeared. She had occasional attacks of mild diarrhea, although as a rule she had two formed movements a day. Examination revealed that she was still quite anemic—hemoglobin 56 per cent—and a mass was still palpable in the ileocecal junction. A resection of the excluded segment was undertaken. The resected specimen showed scarring and evidence of healing in the region of the terminal ileum and cecum, with atrophy of the mucosa and chronic subserosal thickening.

The patient died following operation, death being found to be due to a subacute verrucose endocarditis. There was no further disease found in the intestine at autopsy.

Comment.—This was the first case in which definite pathologic evidence of healing in the excluded loop was found.

Case 4—G F was admitted in December, 1935, with a nine months' history of regional ileitis. Operation at that time revealed involvement of the distal 2 to 3 feet of ileum, a skip area of 1 foot, followed by another 18 inches of markedly diseased ileum. There was marked enlargement of the mesenteric glands and thickening and edema of the mesentery. Ileotransverse colostomy with exclusion was performed. Six months following the first operation she was readmitted, stating that she had been feeling comparatively well and had gained about 20 pounds in weight. She was, however, experiencing occasional attacks of cramplike lower abdominal pain. She was having three to four movements per day. It was assumed that the symptoms were due to the persistence of disease in the excluded loop of terminal ileum. Accordingly, about six months following the primary operation, a resection of the previously excluded small intestine was performed. At operation it was noted that the lesion presented an entirely different picture from the one described at the previous operation. The diseased portion of bowel was narrowed and atrophic and showed no evidence of inflammation. There had been considerable recession of the enlarged mesenteric lymph nodes. The pathologic examination of the resected specimen revealed atrophy of the

mucosa and fibrosis of the submucosa but no ulcerations. The gut wall did not appear indurated. (Up to this point the case had been reported by Lewisohn.²) Following this operation, the patient felt relieved for about eight months, when a recurrence of symptoms again necessitated admission to the hospital. At this time there was definite radiologic evidence of involvement of the loop of ileum entering into the ileocolostomy. Approximately fourteen months after the resection of the excluded segment, the patient was again operated upon. At this operation about 3 feet of the ileum proximal to the ileotransverse colostomy was found to be diseased and was resected together with the ascending and right transverse colon. The specimen revealed a typical picture of a cicatrizing ulcerative enteritis most marked at the stoma and disappearing at the proximal limit of resection. Following this operation, the patient again developed symptoms, and further study revealed still further extension of the disease higher in the bowel.

Comment.—It was assumed that the cause of the patient's symptoms was the presence of the excluded diseased ileum. As resection, however, showed incontrovertible evidence of healing, this belief cannot be sustained. It is more likely that the symptoms were due to the proximal extension which could not at that time be detected. It is important to note that, even though the excluded loop had healed, disease appeared in more proximal segments. It would be difficult to maintain that, under these conditions, extension was due to lymphatic spread from the excluded bowel. The persistent extension of the disease to higher levels of bowel to an extent as great as in this case simply means that this is one of those fortunately rare types of ileitis which, because of the degree of proximal extension, are really not suitable for surgical treatment.

Case 5—H. C., in 1928, had had an appendectomy and drainage for what was thought to be acute appendicitis. A large mass was found in the pelvis and right lower quadrant which was found to consist of cecum, appendix, terminal ileum, and mesentery of the small bowel. A loop of sigmoid was adherent. The mesentery of the terminal ileum was 2 inches thick and oozed pus. The appendix was removed and drainage was instituted. The report on the removed appendix was "acute and chronic inflammation." Eight months following operation the wound broke down and drained for two months. Two years later an abscess developed behind the scar. Drainage was followed by the development of a fecal fistula. Operation revealed a fistula running into the terminal ileum, which was thickened, indurated, edematous, and hyperplastic. The

for either exclusion or resection in these cases may leave such a relatively small area of functioning intestine that grave impairment of nutrition becomes inevitable. From this point of view the disposition of the distal originally diseased segment is a matter of only secondary importance.

The technic of the procedure has been discussed in a previous communication.⁶ In short, the ileum is divided between Payr's clamps, both ends closed, and a side-to-side anastomosis with the transverse colon performed. When performing enterocolostomy, we do not embark upon an extensive exploration of the diseased segments, we simply explore enough to demonstrate the nature and the proximal extent of the disease. There are two possible mistakes that should be guarded against. One is making the anastomosis with the distal loop instead of the proximal, and the other is making the anastomosis at too high a level. In complicated cases both of these doubts may be resolved by tracing the bowel down from the duodenojejunal flexure.

Case Reports

Case 1—R. K. was first admitted in July, 1935, with a two-and-one-half-year history of diarrhea with occasional blood at the end of defecation. A diagnosis of regional ileitis was made. Operation revealed an acute and chronic inflammatory process involving the terminal portion of the ileum, with omental adhesions in this vicinity. The ileum was divided about 1 foot from the ileocecal junction. Both ends were closed and an ileosigmoidostomy performed. For four years following operation patient did well. Gastrointestinal symptoms present prior to operation disappeared and she gained about 45 pounds in weight. Although there were no symptoms, a definite mass could still be felt in the right lower quadrant. (Up to this point the case has been previously reported by Lewisohn.⁷) In March, 1939, she appeared at the follow-up clinic complaining of pain in the right lower quadrant and fever. There were no gastrointestinal symptoms. Examination revealed a large tender mass in the right lower quadrant. Patient was readmitted to the service of Dr. Garlock and was reoperated upon. Acute and chronic inflammation of the excluded loop of bowel typical of regional ileitis was found, together with an abscess in the corresponding portion of bowel. The bowel proximal to the site of division showed no evidence of any disease.

Comment—This case represents a failure following enterocolostomy with exclusion in spite of the great improvement in the general condition. It is important to note that in spite of the persistence of disease in the ex-

cluded segment of bowel there was no new involvement of bowel proximal to the enterocolostomy. This would argue against the belief that proximal extension occurs via the lymphatics from the distally diseased bowel. It should also be noted that there were at no time any enteric symptoms. This case reinforces the contention that an explanation for the presence of such symptoms should be sought in disease proximal to the stoma rather than in the excluded loop.

Case 2—S. R. was first admitted to the Mount Sinai Hospital in 1927 with a history of an appendectomy having been performed eight years before. Following the operation she had irregular attacks of abdominal cramps, which increased in severity just prior to admission. During her stay in the hospital she ran a temperature between 100 and 103 F. Physical examination revealed a tender mass occupying most of the right lower quadrant. Operation at this time revealed a retroperitoneal abscess and an abscess in the ileocecal region. Terminal 6 inches of ileum were found greatly thickened and distorted with some dilatation proximal to the point. During the course of the dissection the bowel was injured, and a satisfactory closure could not be obtained. A profusely draining fecal fistula developed postoperatively. One and one-half months later, an ileocolostomy with exclusion was performed. Following this operation the temperature rapidly subsided and the fecal fistula rapidly closed. Only a mucoid discharge continued. The following year an extraperitoneal residual abscess was drained. She had no further symptoms until 1936 when an abscess in the abdominal wall was again drained. Following this there were occasional attacks of pain and fever, followed by the discharge of small quantities of mucus. In 1937 an ileocecal resection was performed. Two areas of stenosis were found, one about 10 cm. from the ileocecal junction and the other about 4 cm. from the ileocecal junction. There was a marked inflammatory infiltration in the involved mesentery. There was a fistula leading to the right lower quadrant. The proximal stricture was found to be quite marked and may have been the result of the operative injury mentioned above. The patient made an uneventful recovery and has been well since.

Comment—The persistence of the fistula and the recurrent attacks of pain and discharge were probably due to the fact that the two structures present closed off the normal communication with the cecum so that the contents of the segment of excluded bowel were unable to empty into the cecum. This resulted in what was practically almost a bilateral closed loop. The recurrent attacks

fistulas and rectovaginal fistulas. At operation the patient was found to have regional ileitis involving the terminal 3 feet of bowel and an ileosigmoidal fistula. The diseased bowel was resected, and the sigmoidal opening was closed by suture. Following this operation, the patient did well, except that an attempt to close the rectovaginal fistula failed (Up to this time the patient has been reported by Lewisohn²). Approximately three years later she was readmitted to the hospital with the following history. For about a year before admission her stools had gradually increased in frequency until they were again 5 to 10 times a day. She had lost twenty pounds in weight. Reoperation at this time revealed a typical ileitis involving the anastomosis and bowel proximal to it. A resection of the diseased area was performed.

Comment.—It is interesting to note that the original resected specimen was 76 cm in length. The proximal 20 cm appeared quite normal followed by an abrupt onset of disease at that point. From this it would appear that the bowel was divided well into what was, at that time, apparently healthy looking tissue. In spite of the fact that adequate resection into healthy bowel was performed, fresh areas of disease later appeared.

Summary and Conclusions

1. A series of 22 cases of ileocolostomy with exclusion for regional ileitis is reported. There were no deaths.

2. Of the 22 cases, the results as far as the excluded diseased bowel was concerned were favorable in 19.

3. One of the above failures was in a case of complicated ileosigmoidal fistula with a large ileosigmoidal communication in which retrograde passage of stool into an abdominal fistula occurred. Obviously, the operation is not applicable in this type of case.

4. If the above case is excluded, satisfactory effects on the disease were obtained in 19 out of 21 cases.

5. Reappearance of disease proximal to the site of division and anastomosis occurred in 1 case (similar proximal progression of the disease was noted in 3 out of 13 resections).

6. Proximal progression is not dependent upon the type of operation used to treat the obviously diseased bowel.

7. Some diminution in the frequency of such progression may result, first, from careful exploration for "skip" lesions and, second, by placing the anastomosis well proximal to the last visible area of disease.

8. There are cases in which proximal extension will occur regardless of the type of therapy used.

Discussion

Dr. Thomas H. Russell, *New York City*.—It seems noteworthy that the surgeons of the Mount Sinai Hospital, having had their interest in regional ileitis aroused by the identification and description of this disease by Dr. Crohn of the medical staff of their hospital, were inspired to make a thorough search for a surgical solution for the cure of this disease. This is especially significant since it has been emphasized by Crohn in his most recent article on regional ileitis that the disease is a surgical one and "should not only call for earlier surgery but for bigger and more extensive resections." Heretofore, numbers of surgeons have employed ileocolostomy for relief or possible cure of the disease, but in reviewing the most recent literature I can find no evidence of the results obtained from ileocolostomy with exclusion of the distal ileum as Dr. Colp has described in a consecutive series of cases.

Dr. Crohn states that in his experience only half of the short-circuiting operations are attended with success, the other half requiring later resections with a necessarily greater risk.

He does not state that those patients who had short-circuiting operations also had exclusion of the distal ileum, and no doubt many of them had only short-circuiting.

I have reviewed the records of 27 patients (16 men, 11 women) who were admitted to the Post-Graduate Hospital during the past eight years and who were found to be suffering from regional ileitis. The oldest was 62, and the youngest was 2. The average age was 29.

The preoperative diagnoses on these patients are shown in Table 1.

The operative procedures in these cases are shown in Table 2.

There were 3 operative deaths in this series. One was in a child, 4 years of age, in which was found the acute form with peritoneal irritation resembling appendicitis, with a positive, blood-stream, hemolytic streptococcal infection. The appendix was removed, and the child died on the third postoperative day.

Another death occurred in a 21-year-old girl who had, in addition to regional ileitis, Gaucher's disease and thrombocytopenic purpura. In this case an obstructive resection was performed. Death occurred on the sixty-seventh postoperative day.

The third death occurred in a 27-year-old woman who had a one-stage resection of the lower ileum, cecum, and ascending colon, with a lateral

affected segment was resected. The pathologic report was "hyperplastic granuloma of the terminal ileum with fistula formation." Following this operation, the patient was well for five years, when there was a recurrence of abdominal cramps and diarrhea. X-ray revealed an area of diseased ileum, commencing at the ileocolic stoma and extending proximally for 18 inches. At this time the bowel was divided proximal to the fresh area of disease, and an ileosigmoidostomy was performed without resecting the involved segment. Following this operation, the patient did extremely well. Two and one-half years later the patient was admitted to the hospital in a moribund condition from an intestinal obstruction due to a strangulating band. A postmortem was obtained. At this time 52 cm. of excluded ileal segment was found anastomosed with the transverse colon. The proximal half of this excluded loop appeared normal. The remaining two-thirds of the mucosa was smooth and atrophic and had longitudinal scars, especially at the mesenteric attachment, and one small wartlike polyp. The attached mesentery was slightly thickened. The site of the ileosigmoidostomy was normal, and there were no evidences of any enteritis in any of the proximal segments.

Comment—In spite of the fact that this patient had a primary resection of all evidently involved bowel, a fresh area of disease appeared at the site of anastomosis and proximal to it. This area of proximal involvement was cured by a secondary short-circuiting anastomosis. Autopsy revealed no further evidence of disease. In this patient the extension of the disease occurred in continuity. Apparently the bowel was transected too close to the diseased area at the first operation. Had the original transection been performed at a level 2 feet higher, there would not, in all likelihood, have been a recurrence of symptoms.

Case 6—S K. had had an operation performed at another institution in February, 1930, for what was thought to be an appendix abscess. An abscess was found in the mesentery of the ileocecal region and was thought to be tuberculous. The appendix was removed but showed neither evidence of tuberculosis nor evidence of acute inflammation. Postoperatively he developed a fistula, which was repaired ten months later. The fistula commenced to discharge again shortly thereafter. He was admitted to the Mount Sinai Hospital in 1931 with persistent fecal fistulas and a history of cramps, fever, diarrhea, and loss of weight. Lipiodol revealed two tracts, one going into the cecum and the other going into the terminal ileum with perileal accumulation. Operation revealed a large inflammatory mass involving the region of the terminal ileum and cecum. Ileocolostomy with

exclusion was performed. He was readmitted to the hospital about six months later with a recurrence of severe abdominal cramps. He was reoperated upon with the idea that the excluded bowel was probably the source of symptoms, although in the interim all fistulous discharges had ceased. Exploration at this time showed practically complete resolution of the previous inflammation. There was no evidence of any active disease in the previously operated area. Further exploration revealed an area of hypertrophic granulomatous ileitis 1 foot long, beginning about 3 feet proximal to the ileocolic stoma. This segment of bowel was resected. The patient was last seen in October, 1939, approximately eight years later, at which time he was in excellent condition and had no further symptoms.

Comment—This case illustrates the fact that active disease may exist proximally, although the excluded bowel has undergone healing. It also illustrates that extension is not necessarily in continuity. This patient was operated upon when the significance of regional ileitis was first being recognized. In all likelihood this lesion was overlooked at the original operation, because at that time there was insufficient knowledge of the so-called "skip area" of disease.

Case 7—S M. (Oppenheimer) was admitted to the Mount Sinai Hospital in May, 1934, after having been subjected to a number of operations for supposed appendicitis, recurrent abscess, and fecal fistulas. The patient at first refused operation. He returned four months later, in poor general condition, with increase in the fecal and purulent discharge. At this time definite evidence of a large ileosigmoidal fistula was shown by a barium enema. The injected barium ran almost immediately into loops of small intestine. An ileotransverse colostomy with exclusion was performed. The fecal fistula, however, continued to discharge, probably due to the retrograde passage of stool from the sigmoid into the ileum. This patient was readmitted and died following complicated and extensive resection of the ileosigmoidal and ileocutaneous fistulae.

Comment—In this type of case, with a large ileosigmoidal communication in addition to abdominal fecal fistulas, the operation of ileotransverse colostomy with exclusion is probably insufficient, as the sigmoid continued to receive stool which can pass in a retrograde fashion into the ileum and thence out on the abdominal wall. In this type of case a resection seems definitely indicated.

Case 8—S F. was first admitted to the Mount Sinai Hospital in October, 1936, with a six-year history of diarrhea and abdominal pain. She had also developed intractable perianal

fistulas and rectovaginal fistulas At operation the patient was found to have regional ileitis involving the terminal 3 feet of bowel and an ileosigmoidal fistula The diseased bowel was resected, and the sigmoidal opening was closed by suture. Following this operation, the patient did well, except that an attempt to close the rectovaginal fistula failed (Up to this time the patient has been reported by Lewisohn²) Approximately three years later she was readmitted to the hospital with the following history For about a year before admission her stools had gradually increased in frequency until they were again 5 to 10 times a day She had lost twenty pounds in weight Reoperation at this time revealed a typical ileitis involving the anastomosis and bowel proximal to it A resection of the diseased area was performed

Comment—It is interesting to note that the original resected specimen was 76 cm in length The proximal 20 cm appeared quite normal followed by an abrupt onset of disease at that point From this it would appear that the bowel was divided well into what was, at that time, apparently healthy looking tissue In spite of the fact that adequate resection into healthy bowel was performed, fresh areas of disease later appeared

Summary and Conclusions

1 A series of 22 cases of ileocolostomy with exclusion for regional ileitis is reported There were no deaths

2 Of the 22 cases, the results as far as the excluded diseased bowel was concerned were favorable in 19

3 One of the above failures was in a case of complicated ileosigmoidal fistula with a large ileosigmoidal communication in which retrograde passage of stool into an abdominal fistula occurred Obviously, the operation is not applicable in this type of case

4 If the above case is excluded, satisfactory effects on the disease were obtained in 19 out of 21 cases

5 Reappearance of disease proximal to the site of division and anastomosis occurred in 1 case (similar proximal progression of the disease was noted in 3 out of 13 resections)

6 Proximal progression is not dependent upon the type of operation used to treat the obviously diseased bowel.

7 Some diminution in the frequency of such progression may result, first, from careful exploration for "skip" lesions and, second, by placing the anastomosis well proximal to the last visible area of disease

8 There are cases in which proximal extension will occur regardless of the type of therapy used

Discussion

Dr Thomas H Russell, New York City—It seems noteworthy that the surgeons of the Mount Sinai Hospital, having had their interest in regional ileitis aroused by the identification and description of this disease by Dr Crohn of the medical staff of their hospital, were inspired to make a thorough search for a surgical solution for the cure of this disease This is especially significant since it has been emphasized by Crohn in his most recent article on regional ileitis that the disease is a surgical one and "should not only call for earlier surgery but for bigger and more extensive resections" Heretofore, numbers of surgeons have employed ileocolostomy for relief or possible cure of the disease, but in reviewing the most recent literature I can find no evidence of the results obtained from ileocolostomy with exclusion of the distal ileum as Dr Colp has described in a consecutive series of cases

Dr Crohn states that in his experience only half of the short-circuiting operations are attended with success, the other half requiring later resections with a necessarily greater risk.

He does not state that those patients who had short-circuiting operations also had exclusion of the distal ileum, and no doubt many of them had only short-circuiting

I have reviewed the records of 27 patients (16 men, 11 women) who were admitted to the Post-Graduate Hospital during the past eight years and who were found to be suffering from regional ileitis The oldest was 62, and the youngest was 2 The average age was 29

The preoperative diagnoses on these patients are shown in Table 1

The operative procedures in these cases are shown in Table 2

There were 3 operative deaths in this series One was in a child, 4 years of age, in which was found the acute form with peritoneal irritation resembling appendicitis, with a positive, bloodstream, hemolytic streptococcal infection The appendix was removed, and the child died on the third postoperative day

Another death occurred in a 21-year-old girl who had, in addition to regional ileitis, Gaucher's disease and thrombocytopenic purpura. In this case an obstructive resection was performed. Death occurred on the sixty-seventh postoperative day

The third death occurred in a 27-year-old woman who had a one-stage resection of the lower ileum, cecum, and ascending colon, with a lateral

affected segment was resected. The pathologic report was "hyperplastic granuloma of the terminal ileum with fistula formation." Following this operation, the patient was well for five years, when there was a recurrence of abdominal cramps and diarrhea. X-ray revealed an area of diseased ileum, commencing at the ileocolic stoma and extending proximally for 18 inches. At this time the bowel was divided proximal to the fresh area of disease, and an ileosigmoidostomy was performed without resecting the involved segment. Following this operation, the patient did extremely well. Two and one-half years later the patient was admitted to the hospital in a moribund condition from an intestinal obstruction due to a strangulating band. A postmortem was obtained. At this time 52 cm of excluded ileal segment was found anastomosed with the transverse colon. The proximal half of this excluded loop appeared normal. The remaining two-thirds of the mucosa was smooth and atrophic and had longitudinal scars, especially at the mesenteric attachment, and one small wartlike polyp. The attached mesentery was slightly thickened. The site of the ileosigmoidostomy was normal, and there were no evidences of any enteritis in any of the proximal segments.

Comment—In spite of the fact that this patient had a primary resection of all evidently involved bowel, a fresh area of disease appeared at the site of anastomosis and proximal to it. This area of proximal involvement was cured by a secondary short-circuiting anastomosis. Autopsy revealed no further evidence of disease. In this patient the extension of the disease occurred in continuity. Apparently the bowel was transected too close to the diseased area at the first operation. Had the original transection been performed at a level 2 feet higher, there would not, in all likelihood, have been a recurrence of symptoms.

Case 6—S K had had an operation performed at another institution in February, 1930, for what was thought to be an appendix abscess. An abscess was found in the mesentery of the ileocecal region and was thought to be tuberculous. The appendix was removed but showed neither evidence of tuberculosis nor evidence of acute inflammation. Postoperatively he developed a fistula, which was repaired ten months later. The fistula commenced to discharge again shortly thereafter. He was admitted to the Mount Sinai Hospital in 1931 with persistent fecal fistulas and a history of cramps, fever, diarrhea, and loss of weight. Lipiodol revealed two tracts, one going into the cecum and the other going into the terminal ileum with perileal accumulation. Operation revealed a large inflammatory mass involving the region of the terminal ileum and cecum. Ileocolostomy with

exclusion was performed. He was readmitted to the hospital about six months later with a recurrence of severe abdominal cramps. He was reoperated upon with the idea that the excluded bowel was probably the source of symptoms, although in the interim all fistulous discharges had ceased. Exploration at this time showed practically complete resolution of the previous inflammation. There was no evidence of any active disease in the previously operated area. Further exploration revealed an area of hypertrophic granulomatous ileitis 1 foot long, beginning about 3 feet proximal to the ileocolic stoma. This segment of bowel was resected. The patient was last seen in October, 1939, approximately eight years later, at which time he was in excellent condition and had no further symptoms.

Comment—This case illustrates the fact that active disease may exist proximally, although the excluded bowel has undergone healing. It also illustrates that extension is not necessarily in continuity. This patient was operated upon when the significance of regional ileitis was first being recognized. In all likelihood this lesion was overlooked at the original operation, because at that time there was insufficient knowledge of the so-called "skip area" of disease.

Case 7—S M (Oppenheimer) was admitted to the Mount Sinai Hospital in May, 1934, after having been subjected to a number of operations for supposed appendicitis, recurrent abscess, and fecal fistulas. The patient at first refused operation. He returned four months later, in poor general condition, with increase in the fecal and purulent discharge. At this time definite evidence of a large ileosigmoidal fistula was shown by a barium enema. The injected barium ran almost immediately into loops of small intestine. An ileotransverse colostomy with exclusion was performed. The fecal fistula, however, continued to discharge, probably due to the retrograde passage of stool from the sigmoid into the ileum. This patient was readmitted and died following complicated and extensive resection of the ileosigmoidal and ileocutaneous fistulae.

Comment.—In this type of case, with a large ileosigmoidal communication in addition to abdominal fecal fistulas, the operation of ileotransverse colostomy with exclusion is probably insufficient, as the sigmoid continued to receive stool which can pass in a retrograde fashion into the ileum and thence out on the abdominal wall. In this type of case a resection seems definitely indicated.

Case 8—S F was first admitted to the Mount Sinai Hospital in October, 1936, with a six-year history of diarrhea and abdominal pain. She had also developed intractable perianal

fistulas and rectovaginal fistulas. At operation the patient was found to have regional ileitis involving the terminal 3 feet of bowel and an ileosigmoidal fistula. The diseased bowel was resected, and the sigmoidal opening was closed by suture. Following this operation, the patient did well, except that an attempt to close the rectovaginal fistula failed. (Up to this time the patient has been reported by Lewisohn.²) Approximately three years later she was readmitted to the hospital with the following history: For about a year before admission her stools had gradually increased in frequency until they were again 5 to 10 times a day. She had lost twenty pounds in weight. Reoperation at this time revealed a typical ileitis involving the anastomosis and bowel proximal to it. A resection of the diseased area was performed.

Comment.—It is interesting to note that the original resected specimen was 76 cm in length. The proximal 20 cm appeared quite normal followed by an abrupt onset of disease at that point. From this it would appear that the bowel was divided well into what was, at that time, apparently healthy looking tissue. In spite of the fact that adequate resection into healthy bowel was performed, fresh areas of disease later appeared.

Summary and Conclusions

1. A series of 22 cases of ileocolostomy with exclusion for regional ileitis is reported. There were no deaths.

2. Of the 22 cases, the results as far as the excluded diseased bowel was concerned were favorable in 19.

3. One of the above failures was in a case of complicated ileosigmoidal fistula with a large ileosigmoidal communication in which retrograde passage of stool into an abdominal fistula occurred. Obviously, the operation is not applicable in this type of case.

4. If the above case is excluded, satisfactory effects on the disease were obtained in 19 out of 21 cases.

5. Reappearance of disease proximal to the site of division and anastomosis occurred in 1 case (similar proximal progression of the disease was noted in 3 out of 13 resections).

6. Proximal progression is not dependent upon the type of operation used to treat the obviously diseased bowel.

7. Some diminution in the frequency of such progression may result, first, from careful exploration for "skip" lesions and, second, by placing the anastomosis well proximal to the last visible area of disease.

8. There are cases in which proximal extension will occur regardless of the type of therapy used.

ileotransverse colostomy. She died on the fifty-seventh postoperative day from what was thought to be an infection following a pelvic abscess.

It appears to be a reasonable conclusion that if ileocolostomy with exclusion had been used, if for no other purpose than a first-stage procedure, the mortality rate in this series might have been considerably smaller.

On January 6, 1940, I operated upon a patient, 32 years of age, for this condition. There was a perforation of the ileum about 6 inches from the ileocecal junction into the sigmoid. I performed an ileotransverse colostomy with exclusion, thinking that in all probability resection of the ileum

and right half of the colon would have to be done later. This patient has had relief of all symptoms, has gained 25 pounds in weight, and is apparently cured at this time.

Dr Crohn was present at this operation. He most kindly suggested that the ileum be anastomosed to the colon and excluded at a point at least 18 to 20 inches proximal to the ileocecal valve. I feel that this suggestion is the cause of the marked improvement and apparent cure in this patient.

Crohn states: "Let no one worry about intestinal function or postoperative diarrhea or disturbances of absorption of nutrition and vitamin balance after a more radical resection."

"The 20 or more feet of small intestine and 8 or more feet of colon are ample safeguards that denounce penury when determining the limits of resection. Actually, we have now so many cases with subtotal colectomies for regional colitis, and so many high intestinal (small) resections without any degree of diarrhea that interferes with perfect health and function, that one should not only call for earlier surgery but for more radical surgery in order to secure satisfactory results in the treatment of this disease."

I think that Drs. Colp and Ginzburg have presented a valuable contribution to the treatment of this disease.

Time will tell the tale. Even though ileocolostomy with exclusion may not relieve all cases, it is a good first-stage procedure to use in operations for this disease.

A WAR SURGEON TELLS A STORY

Dr. Robert Bárány, professor of ear and throat diseases at the University of Vienna, in 1914 was in charge of the department for head injuries at the war hospital of Przemyśl, before the world war the strongest fortress in Galicia. When Przemyśl surrendered to the Russians, Bárány was taken into Russian captivity. In captivity he was notified by the Stockholm Nobel Prize Committee that he had been awarded the Nobel prize in medicine for his pioneer work in the field of physiology of the brain. Thereupon the Russians released him and with great ovations took him to the Swedish frontier. Later he was a professor at the University of Upsala.

From his experiences in the war hospital at Przemyśl, Bárány told of an extraordinary case, relates the *Medical Record*. Two soldiers brought in a man whom they were supporting on each side. Such aid, however, seemed quite unnecessary, as the man was walking erect, looking fresh and healthy, he merely seemed somewhat frightened. Bárány examined the man and found in his left jawbone a Russian bullet, sticking out two-thirds of its length, not with its broad lower end but with its point. It was now Bárány's turn to be frightened. The bullet had entered the man's right cheek, close to the ear

Its head had penetrated the man's head from right to left, had pierced the left jawbone, and then come to a dead stop.

Bárány touched the point of the bullet gingerly. It did not budge. It was firmly held by the bone. The affair had apparently taken a favorable course. He calmed the man, ordered complete rest, and decided to remove the bullet in a few days after the shot canal had healed. The next morning, however, the hospital manager, Dr. X, director general of the Army Medical Staff, saw the man gaily smoking cigarettes in bed and observed the bullet point sticking out of his left jaw. He ordered immediate removal of the bullet. Bárány's protests were ignored.

The man was placed on the operating table, lightly narcotized, and the necessary instruments were prepared. A young army doctor tried to loosen the bullet from the bone and he was just about to grip it with his instrument to pull it out when suddenly it disappeared. It had lost its hold and had slipped back into the shot canal, which was still open, and stuck somewhere in the brain, which only the day before it had penetrated like lightning and without doing damage.

Five seconds later the man was dead.

PHYSICAL EXAMINATION OF SCHOOL PERSONNEL

ELMER HARRISON ORMSBY, M D , Amsterdam, New York

A LITTLE oftener from year to year there appear, in our medical and health literature, reports concerning physical examinations of school personnel, so that more and more we are being brought to realize what the actual physical state of this group is and what bearing it has on health education and school economy. These reports are for the most part widespread, showing that no part of the country can actually claim a monopoly on this type of work and that there is a sporadic interest in it throughout the country. Our own State of New York has always shown a desire to assume leadership in every health activity, and so I believe we will soon be found in the forefront of this comparatively new and most important activity for the advancement of health education and the improvement of economic efficiency. With this thought in mind I am here recording the procedure employed locally to bring about such an examination and am appending some of the results obtained therefrom.

It has always been my belief that much more definite and lasting progress can be obtained by education than by legislation. The latter, however, can be a useful lever to interest those concerned with the topic at hand and at least create a feeling that some definite and tangible objection must be raised if opposition is to be successful. Section 575, Article 20-A, of the education law states "Such medical inspectors may make such examinations of teachers, janitors, and school buildings as in their opinion the health of the pupils and teachers may require." This became law in 1913 and in my opinion should be ample authority on which to proceed. This opinion is also shared by some members of the legal profession who have given the subject special study. However, the State Department of Education does not wholly share this belief and feels that in order to enforce physical examinations of teachers on tenure the law should be both strengthened and clarified. There was some effort in this direction at the 1939 session of the legislature but it failed to change the law. In May, 1940, at a meeting in Schenectady of the school trustees of half-

a-dozen surrounding counties, there was a unanimous show of hands favoring a change in the present school medical inspection law to make physical examinations of teachers compulsory. The Medical Society of the County of Westchester is also on record as favoring compulsory physical examination of teachers. It is my belief that if effort is continued in this direction the law will eventually be changed. Whatever the outcome may be, I cannot too strongly urge upon physicians the necessity for continued education as to the real value to the recipient of an annual physical examination. Also, care should be exercised so that such examinations are not used for so-called fishing expeditions to gather evidence against a teacher who for some other reason may be *persona non grata* with his or her employer.

Since 1919 when I entered upon my present position I have been striving for an opportunity to make physical examinations on all employees of the Board of Education. The superintendent at that time replied to me when I suggested such a procedure "If you take good care of the children that will be about all you will have time for, and the teachers can look after themselves." When a new superintendent arrived some years later, I talked it over with him but without any change being made in the *status quo*. From time to time I renewed my request for his assistance, not wishing to rely on the law alone, but with no better success. Fifteen years passed, during which time at least one or two of my fellow practitioners occupied places on the Board, but I was unable to get them to introduce and pass local legislation for this purpose. Then a dentist was elected to membership on the Board, and I immediately contacted him and found he was receptive to it. He was unable to get the legislation passed until more recently when we had another change in superintendents and found this one sympathetic to us.

The first resolution passed permitted all teachers to employ their own physicians. This was tried for one year but with poor results. The contracts for teaching the ensuing year were sent out on Friday with a note that they must be returned on Monday accompanied by a certificate of physical fitness to teach issued by a physician. So the teachers

Read before the joint meeting of the New York State Association of School Physicians and the New York State School Nurse-Teacher Association at Saratoga Springs, New York, June 24, 1940.

From his experiences in the war hospital at Przemyśl, Bárány told of an extraordinary case, relates the *Medical Record*. Two soldiers brought in a man whom they were supporting on each side. Such aid, however, seemed quite unnecessary, as the man was walking erect, looking fresh and healthy, he merely seemed somewhat frightened. Bárány examined the man and found in his left jawbone a Russian bullet, sticking out two-thirds of its length, not with its broad lower end but with its point. It was now Bárány's turn to be frightened. The bullet had entered the man's right cheek, close to the ear

Its head had penetrated the man's head from right to left, had pierced the left jawbone, and then come to a dead stop.

Bárány touched the point of the bullet gingerly. It did not budge. It was firmly held by the bone. The affair had apparently taken a favorable course. He calmed the man, ordered complete rest, and decided to remove the bullet in a few days after the shot canal had healed. The next morning, however, the hospital manager, Dr X, director general of the Army Medical Staff, saw the man gaily smoking cigarettes in bed and observed the bullet point sticking out of his left jaw. He ordered immediate removal of the bullet. Bárány's protests were ignored.

The man was placed on the operating table, lightly narcotized, and the necessary instruments were prepared. A young army doctor tried to loosen the bullet from the bone and he was just about to grip it with his instrument to pull it out when suddenly it disappeared. It had lost its hold and had slipped back into the shot canal, which was still open, and stuck somewhere in the brain, which only the day before it had penetrated like lightning and without doing damage.

Five seconds later the man was dead.

peared with counsel, a certificate of physical fitness from a respected local physician, three other reputable physicians, the former superintendent of schools, the junior high-school principal, and several fellow teachers all testifying that not only was she physically fit but that her work was better than that of other teachers who had no physical or mental afflictions. She also took the stand in her own defense but failed miserably on cross examination in three attempts to divide 600 by 15, finally being prompted by her own counsel. The superintendent, the clerk of the Board of Education, and the medical inspector of schools testified for the school system. At the conclusion of the testimony the Board, two of which are physicians, dismissed her by unanimous vote. She appealed to the Appellate Division of the Supreme Court at Albany whose unanimous decision upheld the Board. This decision seemed to strengthen our position regarding compulsory physical examinations until along came the Byrne case which, although not parallel, has decidedly slowed down interest until the law can be clarified. I for one do not feel that we should allow this decision to go unchallenged.

Next we came across a case of mental derangement in one of our younger teachers whose mother had committed suicide during the menopause. The teacher immediately entered a sanatorium for treatment and after several months returned much improved. She is now residing with one of our health teachers and is thus under constant observation. We found 2 cases of hyperthyroidism, 1 of whom was immediately operated upon and has made an uneventful recovery. She is grateful to us for the examination. The other is under medical treatment and has shown marked improvement. We found a case of trifacial neuralgia, and she is now under treatment. We found a case of lateral nystagmus and referred her to an eye man. We found a case of breast tumor, and she is now under constant observation. We found 5 cases of defective hearing and referred them all to an ear specialist. Two are now under treatment, and we are advised that the other 3 can expect no further improvement in their hearing. We found a patient with arthritis deformans of ten years' standing who is constantly under treatment but with a poor prognosis. Two cases of cardiac lesions with imperfect compensation were found. One has now improved under treatment, and the other is dead. Ten teachers had bad teeth. As mentioned before, 21 acknowledge having

hemorrhoids, and probably there are others about whom we do not know, 159 wear glasses, and 2 of these have a vision of 20/40 or worse in the better eye after correction. There is only 1 teacher who acknowledges having foot trouble, but there are a number of others whose arches cannot be said to be anatomically normal.

We found that 304 had been successfully vaccinated, 17 unsuccessfully vaccinated, and 4 never vaccinated against smallpox. Four are Schick-negative to diphtheria, and 46 have had toxin-antitoxin or toxoid, 54 have received typhoid prophylaxis.

I was very much interested in weight and blood pressure and the relationship of one to the other. Of the 325 teachers examined, 180 or 56 per cent were of normal weight. Of these, 43 or about 24 per cent had high blood pressure. Sixty-seven or 20½ per cent were more than 10 per cent overweight, and, of these, 43 or 64 per cent had high blood pressure. Seventy-eight or 23½ per cent were more than 10 per cent underweight, and, of these, 7 or 11 per cent had high blood pressure. Now let us see how this looks by age groups. In the age group 21 to 30 there were 80 teachers. Of these, 9 or 11 per cent had high blood pressure, and, of the 9, 5 or 55½ per cent are overweight. In the age group 31 to 40 there are 115 teachers. Of these, 23 or 20 per cent have high blood pressure and, of the 23, 15 or 65 per cent are overweight. In the age group 41 to 50 there are 85 teachers. Of these, 33 or 39 per cent have high blood pressure and, of the 33, 18 or 54½ per cent are overweight. In the age group 51 to 60 there are 36 teachers, 14 or 40 per cent of whom have high blood pressure. Of the 14, 5 or 35¾ per cent are overweight. In the last age group, 61 to 70, there are 9 teachers, and, of the 9, 5 or 55½ per cent have high blood pressure. However, none of these are overweight. My interpretation of high blood pressure has been arbitrarily fixed at systolic 140 or above. Now let us have a look at low blood pressure. Under this heading I have included all teachers with a systolic of 110 or lower and I find I have three groups as follows: 77 teachers with 110 by 70, 15 with 100 by 50, and 1 with 90 by 50 for a total of 93 teachers with low blood pressure. Of these, 18 or 20 per cent are underweight and 13 or about 14 per cent are overweight. It seems to me that these underweights should maintain their resistance at par, for it is in this group that the opportunity exists for the development of such infections as pulmonary tuberculosis. Those

scurried about to the offices of the various physicians for examinations and certificates. There was no set form of physical examination to be followed so some of the physicians did a complete clinical job of it while others simply said, "Oh! You're all right," and wrote out a certificate of physical fitness or freedom from communicable disease. Then the teachers began comparing notes, and it soon became known which doctors just wrote out the notes and which ones gave the real examination, and the latter were shunned as though they had smallpox. Thus, we were no better off with the physical examination than we had been without it except for the experience it gave us that this was not the way to do it. So the next year the Board changed its resolution and provided that all school employees must be examined by the School Medical Inspector. Armed with this resolution I sought and obtained the cooperation of the local medical profession by having a meeting called for the purpose of discussing the subject. At this meeting there was a full attendance, and a full discussion, and a committee of the society was appointed to draw up or prepare a form to be used by me for these examinations. Cards were printed. Then the superintendent sought and received the whole-hearted support of the teaching body through the teachers' organizations, and the examinations began.

They extended over a period of three months—March, April, and May, 1939. The total number examined was 370. Of these, 325 were teachers (45 men, 280 women), 31 were janitors, and 14 were other employees. A complete history was taken, followed by a complete physical examination except rectal and bimanual. Each person examined had an x-ray of the chest. No urinary examinations, blood examinations, basal metabolic determinations, or electrocardiographs were done except in special instances where dismissal for physical disability was considered.

What things interested me most as a result of these physical examinations were (1) the detection of communicable disease and its subsequent eradication for the protection of the students, (2) the learning of what sort of care a group of professional people such as schoolteachers take of themselves, and (3) learning whether their physical condition was such as to justify their continued employment.

Histories revealed the presence of asthma in 2 cases, diabetes, 3 cases, old cerebral accident, 1 case, hemorrhoids, 21 cases,

and the following operations: bilateral mastectomy for cancer in 2 cases and unilateral mastectomy for cancer or precancerous lesions in 10 cases. All of these have successfully passed through the five-year waiting period without recurrence except 2, and they are still safe. Other operations were: tonsillectomy, 135, appendectomy, 55, nasal operations, 19, hysterectomy, 13, herniotomy, 12, hemorrhoidectomy, 11, thyroidectomy, 7, cholecystectomy, 4, oophorectomy, 3, mastoidectomy, 1, fistula-in-ano 1, amputation of cervix, 1, posterior gastroenterostomy, 1, cesarian section, 1.

X-ray revealed the presence of 2 active and 5 healed cases of pulmonary tuberculosis.

Physical examination revealed the fact that 2 janitors had active pulmonary tuberculosis, moderately advanced. Both immediately went to the sanatorium for treatment. One was there four months and was then discharged as being arrested. The other was there eight months before becoming arrested. This patient had a lung collapse following which the sputum promptly became negative. Both are now back at part-time work, but neither is in a position where he comes directly in contact with the students. I consider the discovery of these cases timely indeed, as one always wonders just how many contacts become afflicted with the disease. The contacts here are those persons who are at an age when tuberculosis thrives best. The problem of rehabilitation is a serious one. Should these patients ever again be allowed to come in contact with students? Should they ever again be allowed to sweep floors, shovel coal, or snow? My answer would be, "No."

Next we found the remains of an old cerebral accident or lesion—either hemorrhage, thrombosis, or embolism—which had occurred six years previously in a then 55-year-old woman, a married teacher, who was and still is an ardent Christian Scientist and, therefore, had no physician at the time of the accident or since. At the time of the accident she was absent from school for about six weeks, and since that time she has been back doing substitute work for about fifteen hours per week. She has a right-sided paresis with exaggerated reflexes, atrophied muscles, hemiplegic gait, exceedingly high blood pressure, an inability to concentrate, and she is subject to spasmodic outbursts of anger or hilarity as her mood dictates. I recommended her dismissal for physical disability, and the Board by unanimous vote dismissed her. She demanded a hearing that was granted. She ap-

peared with counsel, a certificate of physical fitness from a respected local physician, three other reputable physicians, the former superintendent of schools, the junior high-school principal, and several fellow teachers all testifying that not only was she physically fit but that her work was better than that of other teachers who had no physical or mental afflictions. She also took the stand in her own defense but failed miserably on cross examination in three attempts to divide 600 by 15, finally being prompted by her own counsel. The superintendent, the clerk of the Board of Education, and the medical inspector of schools testified for the school system. At the conclusion of the testimony the Board, two of which are physicians, dismissed her by unanimous vote. She appealed to the Appellate Division of the Supreme Court at Albany whose unanimous decision upheld the Board. This decision seemed to strengthen our position regarding compulsory physical examinations until along came the Byrne case which, although not parallel, has decidedly slowed down interest until the law can be clarified. I for one do not feel that we should allow this decision to go unchallenged.

Next we came across a case of mental derangement in one of our younger teachers whose mother had committed suicide during the menopause. We found a patient with arthritis deformans of ten years' standing who is constantly under treatment but with a poor prognosis. Two cases of cardiac lesions with imperfect compensation were found. One has now improved under treatment, and the other is dead. Ten teachers had bad teeth. As mentioned before, 21 acknowledge having

hemorrhoids, and probably there are others about whom we do not know, 159 wear glasses, and 2 of these have a vision of 20/40 or worse in the better eye after correction. There is only 1 teacher who acknowledges having foot trouble, but there are a number of others whose arches cannot be said to be anatomically normal.

We found that 304 had been successfully vaccinated, 17 unsuccessfully vaccinated, and 4 never vaccinated against smallpox. Four are Schick-negative to diphtheria, and 46 have had toxin-antitoxin or toxoid, 54 have received typhoid prophylaxis.

I was very much interested in weight and blood pressure and the relationship of one to the other. Of the 325 teachers examined, 180 or 56 per cent were of normal weight. Of these, 43 or about 24 per cent had high blood pressure. Sixty-seven or 20½ per cent were more than 10 per cent overweight, and, of these, 43 or 64 per cent had high blood pressure. Seventy-eight or 23½ per cent were more than 10 per cent underweight, and, of these, 7 or 11 per cent had high blood pressure. Now let us see how this looks by age groups. In the age group 21 to 30 there were 80 teachers. Of these, 9 or 11 per cent had high blood pressure, and, of the 9, 5 or 55½ per cent are overweight. In the age group 31 to 40 there are 115 teachers. Of these, 23 or 20 per cent have high blood pressure and, of the 23, 15 or 65 per cent are overweight. In the age group 41 to 50 there are 85 teachers. Of these, 33 or 39 per cent have high blood pressure and, of the 33, 18 or 54½ per cent are overweight. In the age group 51 to 60 there are 36 teachers, 14 or 40 per cent of whom have high blood pressure. Of the 14, 5 or 35¼ per cent are overweight. In the last age group, 61 to 70, there are 9 teachers, and, of the 9, 5 or 55½ per cent have high blood pressure. However, none of these are overweight. My interpretation of high blood pressure has been arbitrarily fixed at systolic 140 or above. Now let us have a look at low blood pressure. Under this heading I have included all teachers with a systolic of 110 or lower and I find I have three groups as follows: 77 teachers with 110 by 70, 15 with 100 by 50, and 1 with 90 by 50 for a total of 93 teachers with low blood pressure. Of these, 18 or 20 per cent are underweight and 13 or about 14 per cent are overweight. It seems to me that these underweights should maintain their resistance at par, for it is in this group that the opportunity exists for the development of such infections as pulmonary tuberculosis. Those

who have low blood pressure but are overweight should have their endocrine glands checked

Thus, it can be seen from this rather brief summary of this particular group that physically and mentally we are not exempt from the usual vicissitudes of life because we happen to be associated with a school system, that we should ever be on the alert to protect the

health of those whose physical and mental welfare is committed to our charge and keeping, and that to perform our various duties thoroughly we should constantly take inventory of ourselves, both physically and mentally, to guard against all pathologic encroachments upon our anatomic and physiologic well-being

37 Church Street

DOCTORS GIVE \$1,000,000 A DAY

An editorial that has appeared in half a dozen upstate newspapers shows that people are not blind to the tremendous service the profession is giving them with an open hand. It is entitled "Medicine for the Needy," and runs

"One serious charge made against the medical profession is that the cost of its service puts it out of reach of a considerable proportion of the American people

"That charge has been thoroughly investigated and found to be largely baseless. The Bureau of Medical Economics of the American Medical Association has made an exhaustive study and found that there are few persons in this country desiring medical aid who are unable to obtain it. When queried, the mayors of a hundred typical cities of all population brackets testified that there was no neglect of the poor because of their inability to pay

"Anyone who has seen the medical profession in action knows the truth of this. The average doctor can give but part of his day to the care of patients who pay him. Many hours in each

week are given to charitable work in hospitals, homes, and institutions, treating the indigent whom he knows will never be able to meet a bill.

"The great majority of doctors base their charges on the ability to pay—and those who can pay nothing are given the same scrupulous treatment as the wealthiest patient

"It is reliably estimated that the doctors of this country give at least \$1,000,000 a day worth of free service to the sick. That comes to \$365,000,000 a year—a munificent contribution indeed to the cause of public health. The old saying that 'time is money' is particularly applicable to the doctor—and he gives it generously to the needy

"The fact that the general standard of health in this country is far above that of the rest of the world is the best possible commentary on the quality and extent of American medical service. No man or woman, no matter how meager his resources, need lack expert attention in time of accident or illness"

MEDICAL CARE FOR MIGRANT WORKERS

The California-Arizona plan of medical care for migrants has worked so well that it is being extended to the Pacific Northwest, Texas, and Florida. C B Baldwin, farm security administrator, says in his annual report to Congress, we are told in *California and Western Medicine*

After explaining that the influx of migrants into California and Arizona created a serious public health problem, the report told how the Agricultural Workers' Health and Medical Association was formed in 1938 by FSA with the cooperation of the California Medical Association, the State Department of Health, and the State Relief Administration.

"Migrants make application for medical treatment at the Association's district offices or camp treatment centers," says the report

"A certificate of membership in the Health Association, which serves as an identification

card, is issued to the applicant, who selects his physician from a list of participating doctors

"The Agricultural Workers' Health and Medical Association is billed for the medical or hospital services rendered. In many treatment centers, local physicians work in the clinics at designated hours on alternate days

"Although the migrant workers are obligated to repay the cost of services 'if so requested,' their low income makes repayment impossible in most cases. Some workers, however, have been able to repay a few dollars

"In view of the health protection provided for the two states under this program, it seems probable that public financial support will continue."

At present there are thirteen medical care centers in California, seven in Arizona, four in Texas, and two in Florida

Case Report

PULMONARY ATELECTASIS DUE TO ASPIRATION OF BLOOD FOLLOWING FACE TRAUMA

EDWARD S. VAN DUYN, M D , and JOHN VAN DUYN, M D , Syracuse, New York

ON October 5, 1938, at 9 00 A.M., S M, a railroad employee, aged 50, was found lying unconscious beside the tracks seven miles outside of the city. Presumably he had been struck by the train that passed through an hour before. The patient remembered nothing of the accident. He was taken by ambulance to St. Joseph Hospital where he was first seen by us about two hours after the injury.

On arrival at the hospital the patient was found disoriented though no longer unconscious. He was restless and groaned at intervals but was not in severe shock. There was a deep laceration of the left cheek, 5 to 6 cm. long, penetrating to the maxillary bone above and into the oral cavity below. The left malar bone was fractured in at least two places, and marked ecchymosis and swelling were present about the left eye. The roof of the mouth and the pharynx were coated with dried blood.

Examination of the chest revealed tenderness on the left side anteriorly in the region of the second and third ribs. There was impaired resonance at the right base posteriorly, and the right lower and middle lobes were loaded with coarse bubbling rales. The heart was not displaced. The left side of the chest was clear.

There was a simple fracture of the left clavicle with overriding of fragments, but because of the patient's serious condition no immediate effort was made at reduction. The face laceration was sutured and a drain inserted. The blood that had collected in the mouth and pharynx was swabbed out.

By the next morning the patient's condition had become obviously critical. He was unresponsive and tossed continuously about the bed, mumbling incoherently. The breathing was rapid and labored, and cyanosis was marked. Examination of the chest revealed dullness on the right side posteriorly from the base nearly to the apex, with almost no breath sounds audible. X-ray examination showed the right lung field almost entirely opaque, showed fractures of the left second, third, and fourth ribs, and confirmed the clavicular fracture.

A diagnosis of atelectasis of the right lung due to aspiration of blood into the right bronchus was made, and a bronchoscopic examination was advised. This was performed at 1 30 P.M. by Dr. Gordon D. Hoople, of Syracuse. The operative note reads as follows: "Much thick yellowish-red secretion was seen in the right main bronchus. This was suctioned till the larger passages were clear. Approximately three to four ounces of material were removed. Air was heard in the right lung immediately afterward."

Following bronchoscopic aspiration, the patient's improvement was remarkable. The respirations almost at once became slower and deeper, the cyanosis disappeared and the restlessness ceased. Postoperative x-ray examination showed a considerable increase in air in the right lung field. The patient was placed in an oxygen tent, and by the following morning the temperature had fallen from a prebronchoscopic level of 101.8 to 99 F., and the respirations from 40 to 20 per minute.

This rapid and marked improvement, however, proved to be only temporary. Within twenty-four hours the restlessness, disorientation, labored breathing, and cyanosis began to reappear, and, by the third day after bronchoscopy, the aspiration signs of atelectasis were again present. This time, however, the right upper lobe was involved. X-ray examination confirmed this impression, showing opacity of the right upper lung field and displacement of the trachea to the right.

Bronchoscopic examination was again performed a few hours later, and a chunk of tenacious mucus was found completely blocking the right upper bronchus. The plug was removed with considerable difficulty, but, once accomplished, the same spectacular results followed as on the previous occasion. X-ray examination done some twelve hours after the aspiration showed clearing of the involved lung field. A final plate taken two days later showed further clearing of the right upper lobe to a nearly normal extent.

Following the second bronchoscopic treatment, convalescence progressed steadily, though the patient was not clear mentally until three weeks later and was not in condition to leave the hospital until three weeks after that, six weeks in all after admission to the hospital.

The progress in this case after leaving the hospital is also of interest, because a second series of bronchoscopic aspirations was found necessary in order to clear up the persistent pulmonary symptoms. During the few months after leaving the hospital the patient was up and about, but he did not fully regain his lost weight or strength. A productive cough developed, yielding from 2 to 4 ounces daily of a fairly thick, yellow, odorless sputum. Postural drainage brought no relief, and, five months after discharge from the hospital, bronchoscopic examination was again resorted to.

At the first examination a quantity of thick, purulent, blood-streaked secretion was found in the right main bronchus, the lining of which appeared definitely inflamed. X-ray studies, following lipiodol injection and done at this time, revealed no evidence of bronchiectasis.

Three bronchoscopic examinations in all were performed at approximately two-week intervals,

and on each occasion considerable secretion was aspirated from the right main bronchus. At the final aspiration on June 7, 1939, the lining membrane of the bronchus was noted as showing definitely less evidence of irritation.

Following this series of bronchoscopic treatments, the patient began to show general improvement again, and during the next few months the chest cleared, weight increased to nearly normal, and the cough and expectoration almost entirely disappeared. By the end of the summer his only cause of disability was a weakness in the left arm due to poor union at the site of the clavicular fracture.

Comment

In a review of the literature we were unable to find another instance reported in which trauma to the face was followed by the aspiration of blood into a bronchus and pulmonary atelectasis. We believe, however, that this is probably not actually so rare an occurrence, since all that may be necessary to fulfill the conditions are tem-

porary unconsciousness and a bleeding wound that penetrates into the oral or nasal cavity.

It is also interesting that a postoperative massive atelectasis due to the classic mucous plug in the bronchus should have been a complication in a case of atelectasis due to drowning of the lung.

Conclusions

In any case of face or head injury where the patient has been unconscious and blood is found in the oral cavity or pharynx, the possibility of the aspiration of blood into the tracheobronchial tree should always be considered. If pulmonary atelectasis is present, the prompt removal of the blood through a bronchoscope may prove to be a lifesaving measure.

The aftercare in such a case may be prolonged because of a productive cough. This is apparently due to a persistence of irritation of the bronchial mucous membrane from the previously aspirated blood and may require further bronchoscopic treatments.

REFILLED PRESCRIPTIONS

Few physicians realize, perhaps, how many of their prescriptions are refilled over and over and passed around from hand to hand, to Uncle John, Aunt Kate, Cousin Charlie, and heaven knows who else. Dr. Allen D. Rebo, of Scott, Arkansas, writes to the *Medical World* that the December issue of a house-organ widely distributed among the country's pharmacists* quotes excerpts from a number of the magazine's readers telling of physicians' prescriptions that have been refilled many times. Some of the figures given are almost startling.

These figures may contain some lesson for physicians, at least, they should prove interesting.

A Palestine, Texas, druggist began the furore by telling of a prescription that had been refilled 150 times—and by asking if the "record" had been topped elsewhere. It seems it has been—and how!

A Kansas City, Missouri, pharmacist hastened to report on a prescription his store had refilled 198 times, and, he adds, "we have several others that I am sure will come close to his 150 mark, but why look them up when he is already beaten?"

Why, indeed!

Another "Texan wonder" is from the town of

Mission, with a refill record of 162, but that one is topped in the same paragraph by a Grand Junction, Colorado, "prescription specialist," as he describes himself, who boasts of 252 refills of one prescription.

However, even the startling figure, 252, cannot long hold the center of the stage. From St. Paul, Minnesota, comes the topper of them all—at least for the December issue—and if following issues show this gentleman to have been bested, the final champion will have attained an amazing record indeed. For the St. Paul druggist sends the editor a prescription that his firm had refilled 665 times!

The St. Paul temporary champ failed to enclose his photo also, but an Atlanta, Georgia, pharmacist seems more aware of present-day publicity routine. His photo is taken showing him, the prescription department of his store as a background, busy refilling a prescription "for the 315th consecutive time." We're further enlightened with the information given in the caption beneath the picture that "the prescription contained zinc sulfate, boric acid, and aqua."

The Atlanta pharmacist whose picture graced the page should not feel chagrined at having failed to achieve first place in the remarkable contest, the winner of second place, in such a stiff race, deserves a place among the immortals.

THE LITTLE AND THE MUCH

"One small bit of information brought to light by the research laboratory may eventually prove to be worth many millions of dollars and save untold suffering."

—Basil O'Connor, president, *The National Foundation for Infantile Paralysis*

MEDICAL OFFICERS WANTED

A call is sent out for senior medical officers at \$4,600 a year, medical officers at \$3,800, and associate medical officers at \$3,200, to serve in various government departments. Applications are to be filed with the U. S. Civil Service Commission, Washington, D. C.

Therapeutics

CONFERENCES ON THERAPY

THESE are stenographic reports, slightly edited, of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and the New York Hospital, with collaboration of other departments and institutions. The questions and discussions involved participation by members of the staff of the college and hospital, students, and visitors. The next report will appear in the June 1 issue and will concern "The Uses of Adrenal Cortical Hormones."

The Sulfonamide Drugs

DR. CLAUDE E. FORENER Dr Plummer is going to talk to us first on the sulfonamide drugs and their clinical application.

DR. NORMAN PLUMMER The development of sulfonamide therapy represents one of the most dramatic and most successful achievements in medicine. The chemistry of the sulfonamide drugs evolved slowly at the beginning. The first of these drugs was synthesized as early as 1908. However, it was not until about 1930 that the azo dye containing sulfonamide, "prontosil," was discovered. In February, 1935, Domagk's epoch-making paper appeared, which demonstrated the protective value of prontosil against experimental streptococcal and staphylococcal infections. Although the German literature already included a few minor clinical reports on the use of the sulfonamide dyes, Domagk's contribution represents the real beginning of this treatment.

In the United States the sulfonamide drugs were first used clinically in 1935, but it was not until 1936, about four years ago, that extensive clinical and experimental studies were started. Both prontosil and prontosil were tried, and in 1937 the name sulfanilamide was accepted by the Council on Pharmacy and Chemistry of the American Medical Association for inclusion in *New and Nonofficial Remedies* (Table 1).

TABLE 1—SULFONAMIDE DRUGS

Prontosil	Sodium sulfathiazole
Sulfanilamide (prontosil)	Sulfamethylthiazole*
Neoprontosil	Sulfadiazine*
Sulfapyridine	Sodium sulfadiazine*
(dogenous, M & B 693)	Sulfaguanidine*
Sodium sulfapyridine	Dodecanoyl sulfanilamide*
Sulfathiazole	

* These drugs are under investigation.

Since 1936, in this country sulfanilamide has been given trial in about every infectious disease. The results have been satisfactory in infections caused by the hemolytic strepto-

coccus, the gonococcus, and the meningococcus, in certain of the urinary tract infections, and in chancroid. Because of the disappointing results in the pneumococcal, staphylococcal, and certain other infections, attempts were quickly made to discover related chemicals that might also be useful in these infections. In May, 1938, Whitby reported excellent results in experimental pneumococcal infections with the pyridine analogue of sulfanilamide. By the fall of 1938 this preparation, in this country called sulfapyridine, was producing remarkable recoveries in pneumonia and other pneumococcal infections. At the same time it appeared to have about the same value as sulfanilamide in hemolytic streptococcal, gonococcal, and meningococcal diseases. However, it had little effect on infections caused by the staphylococcus and *Streptococcus viridans*. Because of this and the extreme gastric irritation caused by sulfapyridine, the search was continued for another derivative.

Forsbinder and Walter synthesized the thiazole analogue just a little over a year ago, and this drug, named sulfathiazole, has now received considerable clinical and experimental study. Sulfathiazole produces much less nausea and vomiting, although the other toxic reactions are about the same as for sulfapyridine. It has a slightly wider scope of action in that it shows greater protective value against experimental staphylococcus. However, it has not as yet been decided whether sulfathiazole has the same high protective value as sulfapyridine against the pneumococcus.

Sulfadiazine, which is the pyrimidine derivative of sulfanilamide, is one of the last of these drugs to receive attention. This drug was synthesized by Robin, Williams, Winnek, and English and used experimentally by Feinstein, Williams, Wolff, Huntington, and

Crossley These experimental studies indicate that sulfadiazine is at least equal to sulfanilamide against hemolytic streptococcal infections and equal to sulfapyridine or sulfathiazole against pneumococcal and staphylococcal infections. In addition, it produces a high degree of protection in experimental infections due to Friedländer's bacillus. In animals it has the further advantage of being more rapidly and more uniformly absorbed, of giving higher blood concentrations, and of being less toxic.

Dr Ensworth and I have just reported our absorption and excretion studies in the human, and these are comparable to the results in experimental animals. Furthermore, at Bellevue and the New York Hospital we have administered the drug to about 150 patients. In a small series of pneumococcal pneumonias, the clinical results compare favorably with those obtained with sulfapyridine and sulfathiazole. In certain other infections, particularly those due to the Friedländer's bacillus, the results are encouraging. The most remarkable finding in our clinical experience with sulfadiazine is that almost no nausea and vomiting follows its administration. In our series there have been 4 cases of toxicity—3 with skin eruptions and 1 with hematuria. However, the number of cases observed is still too small to make any comparison of the less common and more serious reactions, and, furthermore, we have not as yet ruled out the possibility of a reaction such as the peripheral neuropathy which occasionally follows sulfamethylthiazole administration (Table 2).

With the increasing number of sulfonamide drugs available, it has become more difficult to make the correct choice for a particular infection. In general practice that problem is considerably simplified, because only sulfanilamide, neoprontosil (which is absorbed as sulfanilamide), sulfapyridine, sodium sulfapyridine, and sulfathiazole* have been accepted for general use. Sulfanilamide has received the most extensive trial, is more rapidly absorbed and eliminated, and does not form concretions in the urinary tract. For these reasons sulfanilamide should be used in infections due to the *Streptococcus hemolyticus*, meningococcus, and gonococcus until it has been proved that one of the other drugs has a greater value in these conditions.

Either sulfapyridine or sulfathiazole may be used in pneumococcal infections. Because there is less gastric irritation, sulfathiazole may be used in the milder cases, but sulfa-

pyridine remains the drug of choice in the more serious cases. Sulfathiazole has a greater protective power than sulfapyridine in experimental staphylococcal infections, and because of this, even though the clinical studies are not convincing, sulfathiazole is recommended in staphylococcal infections.

All strains of a particular organism do not respond in exactly the same way. For example, there may be certain strains of pneumococci that are not affected by sulfathiazole but do respond to sulfapyridine or vice versa. Such a condition may be true for the staphylococci or any other organism. For this reason, in some cases it may be important to shift from one sulfonamide drug to another. Also, there may be an occasional critically ill patient in whom it is well, in order to cover fully the possibilities, to use two of the drugs from the start.

The sulfonamides are usually given orally. For parenteral administration the two preparations that are principally used are neoprontosil and sodium sulfapyridine. Neoprontosil in the body breaks down into sulfanilamide, and its activity is dependent upon the concentration of sulfanilamide in the blood and tissues. Sodium sulfapyridine likewise changes to sulfapyridine.

The solution of sodium sulfapyridine is highly alkaline, and when the drug was first used it was expected that it would produce

* Sodium sulfathiazole has now been accepted

TABLE 3—SULFONAMIDE THERAPY TOXIC REACTIONS

Renal irritation	Nausea and Vomiting
Hematuria	Dehydration
Colic	Acidosis

Hyperleukocytosis	Headache
Hepatitis—jaundice	Neuritis
Cyanosis	

severe local reactions if it were applied directly to the mucous membranes or other tissues. At the start it was recommended that sodium sulfapyridine be administered intravenously only and in concentrations of 5 per cent or less. Cautiously, other methods have been tried. We have used solutions of 25 to 35 per cent intravenously without any evident harmful effect on the vessels. We have used these same concentrated solutions intramuscularly, also without local reactions. Following the recommendations of Bullowa, we have routinely used sodium sulfapyridine orally, again without local reactions or any increase in the usual reactions encountered with sulfapyridine. Sodium sulfapyridine also may be used rectally, and we give it in rather large doses to obtain a satisfactory level of sulfapyridine in the blood. More recently, Taplin, Jacox, and Howland, at the Strong Memorial Hospital, have reported the use of sodium sulfapyridine by hypodermoclysis, giving 0.3 to 0.7 per cent solution in saline—that is, from 3 to 7 Gm. of the drug in 1,000 cc of saline, depending upon the dosage desired. They have reported excellent clinical results, no particular local reaction, and satisfactory blood levels of the drug.

The toxic reactions that in our experience have followed the administration of the sulfonamide drugs are included in Table 3. While the list is a lengthy one and shows a variety of conditions, some of which have been extremely bothersome, fortunately there have not been many serious reactions. Only one fatality, a case of aplastic anemia and toxic hepatitis following sulfapyridine, has occurred in our entire New York Hospital and Bellevue Hospital series of more than 1,500 patients treated with the sulfonamide drugs.

The renal irritation that has occurred after sulfapyridine, sulfathiazole, and more recently

from sulfadiazine has attracted particular attention because it is a unique type of reaction. These drugs or their acetylated products, in the course of excretion by the kidneys and urinary tract, form crystals or concretions of crystals which cause irritation and obstruction. If irritation only occurs, there may be hematuria and renal colic, but with obstruction there is oliguria or sometimes anuria, and it may lead to nitrogen retention and even uremia. Fortunately, these reactions occur infrequently. In our experience they have always been controlled by immediately discontinuing the drug and increasing the fluid intake.

Anemia and leukopenia may follow the use of any of the sulfonamide group of drugs, but again the severe forms of these conditions do not appear frequently. We have recognized only 2 cases of acute hemolytic anemia, and only 1 of these was in our hospital series. The 1 case followed a small dose of sulfanilamide and the other a small dose of sulfapyridine. Both cases sustained serious impairment of renal function, which existed to the time that it became impossible to follow the patients. In our Bellevue group, 1 patient developed severe aplastic anemia and died, showing also an extensive toxic hepatitis. Severe granulocytopenia occurred several times, but, following prompt interruption of chemotherapy, full recovery ensued. Marked hyperleukocytosis was discovered only once, and this was in 1 patient with acute hemolytic anemia.

Jaundice was produced by the sulfonamides only once, and this was in our fatal case of aplastic anemia and toxic hepatitis. Cyanosis, while it occurs frequently with sulfanilamide, is only rarely evident with sulfapyridine or sulfathiazole.

Nausea and vomiting occurred in over 50 per cent of patients treated with sulfapyridine, and this more than anything else militated against its use. The lowered incidence of this reaction has given sulfathiazole its chief advantage over sulfapyridine.

Skin eruptions are occasionally produced by all of the sulfonamide drugs. Drug fever usually accompanies the rashes, although fever may occur without any other manifestation of toxicity. Since our experience with the use of the sulfonamides has grown, we have become aware of a number of queer toxic reactions. A skin condition similar to erythema nodosum has been observed following sulfathiazole. Also, marked conjunctivitis has appeared after sulfathiazole. Various types of mild toxic psychosis have been noted,

and patients have also complained of a variety of headaches and neuralgias. Several patients have developed mild arthritic symptoms. We have not seen the peripheral neuropathy that follows the use of sulfamethylthiazole after any of the other sulfonamide drugs that we have used. Careful follow-up of patients has failed to reveal any late toxic reactions that might occur after discharge from the hospital.

The list of reactions is an imposing one, and while it should serve to emphasize the significance of recognizing the untoward effects of the sulfonamide drugs, it should not detract from a prompt and adequate usage of these highly effective agents. Furthermore, our experience shows that there is little danger provided the reactions are diagnosed promptly and the proper measures are instituted immediately.

DR FORKNER. We will discuss this subject later, and maybe then Dr Plummer can mention the things he believes need stressing.

Dr Modell will now tell us something about the pharmacologic aspects of those drugs.

DR WALTER MODELL. I shall merely mention some of the pharmacologic properties of sulfanilamide and indicate how some of the more frequently employed derivatives of sulfanilamide differ with regard to these properties. Such a comparison may be useful in selecting one of these drugs for the treatment of infections in which antibacterial action can be obtained from more than one member of the group of drugs.

I think it is safe to say at the outset that these substances are all pharmacologically similar, the differences are quantitative rather than qualitative. Sulfanilamide is fairly rapidly absorbed from the intestinal tract when taken by mouth, and a peak of the blood level is reached within about two or three hours after a single dose. Sulfathiazole is absorbed about as rapidly. Sulfapyridine is absorbed considerably less rapidly and more irregularly, five or more hours usually elapse after a single dose before peak concentration is reached. Sodium sulfapyridine, on the other hand, is much more rapidly absorbed than sulfapyridine, and peak blood concentration is reached about two and one-half hours after a single oral dose. Bullowa reported some cases in which a high level was reached as soon as five or ten minutes after a single dose of sodium sulfapyridine.

Once it is absorbed, sulfanilamide is distributed throughout the body, and the concentration in the tissues, exudates, and transudates is about the same as that found

in the blood, except that it is appreciably lower in the fat and bones. This is also true for sulfapyridine and sulfathiazole, although with sulfapyridine there seems to be some concentration of the drug in the liver. The concentration of sulfanilamide in the cerebrospinal fluid is somewhat less than that found in the blood. The concentration of sulfapyridine in the cerebrospinal fluid is said to range between 50 and 70 per cent, while that of sulfathiazole is even lower, perhaps 10 to 30 per cent of that found in the blood.

All these substances are acetylated mainly in the liver but also to some extent in the spleen. The acetylated compound has reduced antibacterial potency and is more toxic and less soluble in urine than the unconjugated drug. It is an example of a detoxification process gone astray. In the case of sulfanilamide, usually between 10 and 20 per cent is found in the blood in the acetylated form. In the case of sulfathiazole the percentage runs closer to from 20 to 30 per cent. With sulfapyridine the percentage runs even higher, sometimes over 50 per cent of the total sulfapyridine being in the acetylated form. The longer the substance remains in the body, the greater the amount of acetylation, and this may account in part for the high degree of acetylation of the sulfapyridine.

The substances are excreted almost quantitatively in the urine both in the free and combined form. Within twenty-four hours after a single dose of sulfanilamide or sulfathiazole, most of it can be recovered in the urine. In the case of sulfapyridine, excretion is slower, taking more than forty-eight hours for the greater part of a single dose to be excreted.

It is interesting to note that the renal clearance of free sulfanilamide or free sulfapyridine is less than the clearance of the conjugated substance, indicating that the renal tubule reabsorbs the uncombined sulfanilamide to a greater degree than the acetylated. In the case of sulfathiazole the clearance of free sulfathiazole is about equal to that of acetylated sulfathiazole, and this may, in part, account for the rapid elimination of sulfathiazole.

Recent determinations on animals put the drugs in this order of toxicity: sulfanilamide the least toxic, sulfathiazole next, and sulfapyridine the most toxic.

Nausea and vomiting occur much less frequently, as has already been mentioned, when sulfathiazole is used. In the case of sulfathiazole it has also been stated that there is

FIG 1 From Plummer, N, and Ensworth, H K. Proc Soc Exper Biol & Med. 45 734-738, 1940

no reduction in the carbon dioxide combining power of the blood

On the mechanism of action of these substances there is no agreement. Several suggestions have been made, such as a direct antibacterial action, an antitoxic action, stimulation of phagocytosis, or some anti-enzymatic action.

DR FORKNER. Dr Magill is going to say something about the bacteriologic aspects of the sulfonamide drugs.

DR THOMAS P. MAGILL. The various sulfanilamide-like compounds seem to exert the same fundamental effect on bacteria *in vitro*, they differ chiefly in the degree in which the effect is exerted. Early investigations indicated that the *in vitro* sulfanilamide effect is essentially bacteriostatic, that sulfanilamide exerts little or no effect on bacteria during the early growth phase, and that the effect is not permanent. That is, bacteria regain their full virulence when, following exposure to sulfanilamide, they are washed and inoculated into animals. Moreover, it has been shown that sulfanilamide is not absorbed by the bacteria or diminished in concentration by contact with them.

The sulfanilamide effect *in vitro* is influenced by the nutrient value of the culture medium, peptone and other enriching substances inhibit the effect. It has been shown that the inhibition is due not to the direct action of peptone on sulfanilamide but to the ability of peptone to promote bacterial

growth. The effect is influenced also by the size of the inoculum, a culture that has received only a small inoculum may become eventually sterilized by sulfanilamide, whereas a similar culture that is heavily inoculated may finally grow out as well as the controls. The effect is also influenced by temperature—at 40 C bacteria are more readily destroyed than at 37 C, whereas at 0 C the effect seems to be negligible.

It has been suggested that *in vitro* sulfanilamide exerts its effect probably by interference with some function essential to bacterial metabolism. Several groups of investigators have isolated from bacteria a so-called growth factor that is effective in inhibiting the action of sulfanilamide in *in vitro* experiments. The factor has been isolated from a number of species of bacteria, moreover, the factor from any one species seems to be effective in inhibiting the sulfanilamide effect upon any of a number of other species. Recently it has been shown that actually two factors are involved—one is a growth factor, the other is a factor which in itself is inhibitory to the action of sulfanilamide but is not growth-promoting. This latter factor resembles in chemical properties *p*-aminobenzoic acid, which also possesses the capacity to inhibit the action of the sulfanilamide group of compounds. Although there is a direct quantitative relationship between the degree of inhibition and the concentration of the growth factor (or of *p*-aminobenzoic acid), varying with the concentration of sulfanilamide, no true molecular reaction occurs. On the basis of such evidence it is suggested that sulfanilamide exerts its effect by competition with a substrate, perhaps related to *p*-aminobenzoic acid, for the action of an essential enzyme.

Another interesting suggestion in support of which evidence has been obtained, is that sulfanilamide and related drugs inhibit the activity of catalase, thereby causing an accumulation of hydrogen peroxide. The suggestion is based on the theory that the sulfanilamide compounds when converted into the corresponding hydroxamides exert an anticatalase effect. A number of acyl aminobenzenesulfonhydroxamides have been tested and have been found to inhibit catalase activity, but to accept the theory it must be assumed that at least a small amount of sulfanilamide is converted into a compound with a hydroxylamino group.

A number of other interesting investigations have been made to determine the mechanism of the sulfanilamide effect, but there is time

and patients have also complained of a variety of headaches and neuralgias. Several patients have developed mild arthritic symptoms. We have not seen the peripheral neuropathy that follows the use of sulfamethylthiazole after any of the other sulfonamide drugs that we have used. Careful follow-up of patients has failed to reveal any late toxic reactions that might occur after discharge from the hospital.

The list of reactions is an imposing one, and while it should serve to emphasize the significance of recognizing the untoward effects of the sulfonamide drugs, it should not detract from a prompt and adequate usage of these highly effective agents. Furthermore, our experience shows that there is little danger provided the reactions are diagnosed promptly and the proper measures are instituted immediately.

DR FORENER: We will discuss this subject later, and maybe then Dr. Plummer can mention the things he believes need stressing.

Dr. Modell will now tell us something about the pharmacologic aspects of these drugs.

DR. WALTER MODELL: I shall merely mention some of the pharmacologic properties of sulfanilamide and indicate how some of the more frequently employed derivatives of sulfanilamide differ with regard to these properties. Such a comparison may be useful in selecting one of these drugs for the treatment of infections in which antibacterial action can be obtained from more than one member of the group of drugs.

I think it is safe to say at the outset that these substances are all pharmacologically similar, the differences are quantitative rather than qualitative. Sulfanilamide is fairly rapidly absorbed from the intestinal tract when taken by mouth, and a peak of the blood level is reached within about two or three hours after a single dose. Sulfathiazole is absorbed about as rapidly. Sulfapyridine is absorbed considerably less rapidly and more irregularly, five or more hours usually elapse after a single dose before peak concentration is reached. Sodium sulfapyridine, on the other hand, is much more rapidly absorbed than sulfapyridine, and peak blood concentration is reached about two and one-half hours after a single oral dose. Bullowa reported some cases in which a high level was reached as soon as five or ten minutes after a single dose of sodium sulfapyridine.

Once it is absorbed, sulfanilamide is distributed throughout the body, and the concentration in the tissues, exudates, and transudates is about the same as that found

in the blood, except that it is appreciably lower in the fat and bones. This is also true for sulfapyridine and sulfathiazole, although with sulfapyridine there seems to be some concentration of the drug in the liver. The concentration of sulfanilamide in the cerebrospinal fluid is somewhat less than that found in the blood. The concentration of sulfapyridine in the cerebrospinal fluid is said to range between 50 and 70 per cent, while that of sulfathiazole is even lower, perhaps 10 to 30 per cent of that found in the blood.

All these substances are acetylated mainly in the liver but also to some extent in the spleen. The acetylated compound has reduced antibacterial potency and is more toxic and less soluble in urine than the unconjugated drug. It is an example of a detoxification process gone astray. In the case of sulfanilamide, usually between 10 and 20 per cent is found in the blood in the acetylated form. In the case of sulfathiazole the percentage runs closer to from 20 to 30 per cent. With sulfapyridine the percentage runs even higher, sometimes over 50 per cent of the total sulfapyridine being in the acetylated form. The longer the substance remains in the body, the greater the amount of acetylation, and this may account in part for the high degree of acetylation of the sulfapyridine.

The substances are excreted almost quantitatively in the urine both in the free and combined form. Within twenty-four hours after a single dose of sulfanilamide or sulfathiazole, most of it can be recovered in the urine. In the case of sulfapyridine, excretion is slower, taking more than forty-eight hours for the greater part of a single dose to be excreted.

It is interesting to note that the renal clearance of free sulfanilamide or free sulfapyridine is less than the clearance of the conjugated substance, indicating that the renal tubule reabsorbs the uncombined sulfanilamide to a greater degree than the acetylated. In the case of sulfathiazole the clearance of free sulfathiazole is about equal to that of acetylated sulfathiazole, and this may, in part, account for the rapid elimination of sulfathiazole.

Recent determinations on animals put the drugs in this order of toxicity: sulfanilamide the least toxic, sulfathiazole next, and sulfapyridine the most toxic.

Nausea and vomiting occur much less frequently, as has already been mentioned, when sulfathiazole is used. In the case of sulfathiazole it has also been stated that there is

a patient free from vomiting. This discussion is not as significant as it was before the advent of sulfathiazole and sulfadiazine.

DR FORKNER. I would like to ask a question concerning the concentration of the drugs in the blood. Are you relying on that as the most important factor in determining dosage, or are you relying on other factors such as the general clinical condition of the patient? What is the status now, in your opinion, of the blood levels of these various drugs in relationship to their therapeutic effect?

DR PLUMMER. Again we must go to the experimental studies, particularly to the report that Marshall gave at The New York Academy of Medicine a short time ago. He found that in streptococcal infections in mice, in order to save 100 per cent of the animals, a certain concentration of sulfanilamide in the blood must be obtained. In other words, the survival rate is proportional to the drug concentration in the blood and in turn proportional to the dosage of the drug. The same relationship quite certainly applies to infections in man. To establish the lowest level that will give the highest percentage of recoveries has not been possible. It seems to be about 4 to 5 mg. per hundred cubic centimeters, which is the average level obtained in adults with sulfapyridine and sulfathiazole on a dosage of 10 Gm. every four hours after an initial dose of 20 Gm. In patients with severe infections and in cases when there has not been satisfactory response to treatment, the blood level determination is imperative and should be the guide to dosage.

DR H. B. RICHARDSON. How soon does the vomiting stop after the last dose of sulfapyridine, assuming a therapeutic level to be present in the blood?

DR PLUMMER. That is a variable. I would say that usually it stops in from eight to twenty-four hours after the last dose of the drug.

DR WHEELER. If a generally satisfactory dosage schedule does not produce a blood level that can be regarded as satisfactory—as happens not infrequently—what does one do? Do you increase the dose of the drug, and, if so, what limits of increase do you believe are safe, or do you feel that reduction of the fluid intake will be effective in raising the blood level?

DR PLUMMER. The degree of absorption of sulfapyridine or sulfathiazole—not so much of sulfadiazine or sulfanilamide—is variable. In those patients who show a particularly low level or one below that estimated

to be optimal for an individual case, there are several means of elevating the concentration. The most certain method is that of supplementing the oral dosage by parenteral administration of an additional amount. Increasing the oral dosage may be tried, but it does not always prove effective because the problem is more apt to be one of absorption from the gastrointestinal tract rather than one of dosage. The reduction of fluid intake might apply in a patient receiving excessive quantities of fluid but might be dangerous in the usual case. Occasionally a patient receiving sulfapyridine will show a low blood level of free sulfapyridine but a high level of total drug, indicating a high degree of acetylation. In such a case, because of the possibility of acetylated sulfapyridine crystals obstructing the urinary tract, it is dangerous to increase the dosage, and it might be wiser to change to another sulfonamide drug.

DR CARY EGGLESTON. Have you any evidence that points to an explanation of why certain rare patients will fail to develop a satisfactory blood level over a considerable period of time with increasing dosage and limitation of fluid and will then, perhaps by change of drug within the group, develop an extremely high level? I have in mind a patient in whom it seemed impossible to get the blood level above about 3 mg. per hundred cubic centimeters with sulfapyridine. With the use of sodium sulfapyridine, large doses were required to produce significant rise. After continuation of such doses for several days the blood level rather abruptly rose to about 13 or 14 mg. per hundred cubic centimeters.

DR PLUMMER. No, I do not have a definite explanation, but I believe that it was either a question of acetylation or of excretion by the kidneys.

DR EGGLESTON. There were no renal symptoms.

DR MODELL. It is said that the degree of acetylation varies greatly in the different individuals. Does the tendency in an individual to a high degree of acetylation of one compound apply to the other sulfonamide derivatives?

DR PLUMMER. In a few cases where we have compared sulfapyridine with sulfathiazole, we have found that a patient showing high acetylation with sulfapyridine also showed a high acetylation with sulfathiazole. Whether that applies to sulfadiazine we do not know.

DR JANET TRAVELL. One of the toxic

only to point out that, in general, they indicate that the effect is due to an interference with bacterial metabolism. Most of the evidence suggests that the interference is effected by the sulfanilamide compounds competing with certain substrates for essential enzyme activity.

DR FORKNER We are now going to have the subject discussed generally, and I am sure that Dr Plummer, Dr Modell, Dr Magill, and the others here will try to answer any questions you may have in mind.

DR McKEEN CATTELL I would like to ask Dr Plummer a question with regard to the acetylation of these compounds. I understand that he has been working with sulfadiazine and that it is somewhat less acetylated than the others.

DR PLUMMER We have some curves here that show that (Fig 1)

These curves show the average blood levels of free and total drug after a single dose of sulfathiazole, sulfapyridine, and sulfadiazine. We believe that the difference between the two curves with each drug represents the amount of acetylation. Sulfadiazine shows a more rapid absorption and much less acetylation than sulfapyridine. When compared with sulfathiazole it shows about the same acetylation and rate of absorption but a much higher level and a slower elimination.

DR C H WHEELER I wonder, Dr Plummer, if you would discuss the significance of the relationship between acetylated and free drug.

DR PLUMMER The drug is given as the free drug, and in the body, probably largely in the liver, it is changed to the acetylated or combined form. It is most significant that the combined drug is not active. Furthermore, such a toxic reaction, as the renal irritation which sometimes follows the use of these drugs is dependent more upon acetylated drug than upon the free drug. The crystals found in the urine and the stones formed in the kidneys and ureters are for the most part the acetylated fraction of the drug.

DR HARRY GOLD Is not this acetylation merely an illustration of a general body mechanism of protection against poisons?

DR PLUMMER I think you can tell us more about that than I could. I would like to know.

DR GOLD There are a great many drugs that are eliminated by synthesis. Chloral hydrate is eliminated by synthesis of a breakdown product with glycuronic acid. Carboic acid is detoxified by synthesis into

ethereal sulfate. Epinephrine is inactivated by synthesis into a sulfate ester. These processes are not always quite complete, so that some of the drug remains unchanged.

DR MODELL The statement is made that in the case of the acetylated sulfapyridine precipitated crystals are found in the renal pelvis, whereas in the case of the acetylated sulfathiazole they are found in the tubules. Is that your experience?

DR PLUMMER That is not our experience, but we follow the experimental studies that have been reported. Antopol and his co-workers have been particularly interested in this investigation, and I believe that in their experimental animals acetylsulfapyridine crystals are usually formed in the renal pelvis and in the ureters, while acetylsulfathiazole crystallized in the tubules. Furthermore, Antopol and his co-workers have reported that after the intravenous injection of a large amount of sodium sulfathiazole, the free drug precipitated in the collecting tubules and produced a fatal reaction in the animal.

DR WHEELER The nausea and vomiting that follow the use of sulfanilamide or its derivatives can be most disturbing factors and not rarely require that the drug be discontinued. In this hospital we have tried all sorts of ways of controlling it. We have given the sulfapyridine with sodium bicarbonate, with milk, and with applesauce. We have also given it in the form of the solution or suspension in 50 per cent glucose. It is my impression that none of those measures is effective in reducing the nausea and vomiting, with the possible exception of 50 per cent glucose. What is your experience? Do you know of any way of administering sulfapyridine which will diminish the nausea and vomiting?

DR PLUMMER Our experience has been the same. We have found no way of controlling that bothersome toxic manifestation except by reducing the level of sulfapyridine in the blood. It is because of this and certain other observations that we believe the nausea and vomiting is of central origin. The methods that may be used to reduce the blood level are obvious. The simplest is to omit the drug for one or two doses. The other method is to increase the fluid intake either by infusions or hypodermoclyses or by forcing fluids by mouth. These procedures, by reducing the blood level, naturally diminish the range of efficacy of the agent. So in each case it is necessary to consider whether it is more important to have a higher level or

that the cure in this disease is the distinct exception rather than the rule

Dr Modell, will you summarize for us?

Dr MODELL The conference is in a sense a summary of the mass of information which has been accumulated on this subject

I would like to point out that, while in a relatively short time the sulfonamide drugs have proved to be of great value in the treatment of an impressive list of serious ailments, there is already reason to believe that in time there will be new additions to the sulfonamide drugs which will increase their range of antibacterial action, which will be less toxic for man, and which will be easier to administer and control

It has been indicated here today that lives can be saved if these drugs are used where they are indicated and if the blood levels of the drug are used as a guide to the therapeutic regimen Toxic effects will be reduced to a minimum if the concentration in the blood, particularly of the acetylated form, and the

blood picture are followed carefully These measures will probably be valid no matter what or how many new derivatives are added to the list.

The knowledge of the specific antibacterial actions of each member of this group of drugs and a correlation between the clinical features of each case and the pharmacologic features of the drugs—such as the rate of absorption, rate of elimination, toxic effects, concentration of the drug in the cerebrospinal fluid, etc—will lead to the selection of the best member of the group of drugs in each instance

The good reputation of the sulfonamide drugs must be guarded by an understanding of their action and by careful use The indiscriminate administration of these drugs, which is already practiced in some quarters, and the relaxation of precautions with drugs so potent and so widely used may lead to a wave of accidents which will make for a fear of the drugs, throw them into disrepute, and retard progress in this field

WISCONSIN EXPERIMENTS ABANDONED NO DEMAND

It is of interest to students of sickness insurance plans to note that the experiment in voluntary sickness insurance carried on for several years by the Douglas County Medical Society in Superior, Wisconsin, has been discontinued, says *Minnesota Medicine*

Reasons for abandonment are significant first, that there was an exceedingly small demand for the plan, second, the cost of acquiring subscribers was extremely high, third, the plan did not reach those in the low-income group for which

it was designed, fourth, operating costs, which included the new "middle man," were high, fifth, premiums were too small to permit payment of minimum standard fees for the community to the physicians while at the same time paying overhead costs and creating a necessary reserve

Discontinuance of the trial plan in Milwaukee has also been announced for much the same reasons, likewise, the effort started some time ago to develop a plan in Rock County

THE CART BEFORE THE HORSE

Some of the advocates of compulsory sickness insurance argue that this system should be adopted now as a defense measure Apparently they are unaware of the more fundamental medical defense projects which are lagging for lack of funds, observes the *New York Medical Week*

The production of blood plasma is a striking example The Army desires 50,000 quarts a year As Dr Morris Fishbein has pointed out, this requires 200,000 donors To obtain that number of qualified subjects, at least 600,000 persons must be examined, physically and serologically This would not be a great expense, compared to the billions that are tossed about so lightly at Washington, but so far the government has made no move to pay for such examinations

On the same subject, the processing of blood plasma requires special apparatus At present only five machines are available for this purpose in the entire country If the government has ordered more, we have not heard of it

In the meantime, our own county committee on blood transfusion is trying to work out a method for supplying blood or plasma to the

indigent when sorely needed and to the small hospitals where blood banks are not practical.

A similar situation exists with respect to medicomilitary research. Even such immediately important fields as aviation medicine are not being explored to their limits because grants are made in occasional small sums where a couple of millions is needed

If the government is having difficulty in financing these unquestionably urgent defense measures, how can it even consider compulsory sickness insurance? After all, the amounts required to organize the production of blood plasma and research into the medical problems associated with aviation and submarine warfare are a drop in the bucket compared to the enormous costs of compulsory sickness insurance.

Anything could be a "defense measure" by the definition that includes compulsory sickness insurance in this term. Actually there is nothing obligatory prepayment would supply which is not already available at lower cost. Before the government undertakes a costly controversial project of this nature in the name of defense, it should provide funds for defense necessities

reactions that is listed is cyanosis. Would you say something about its importance and its etiology?

DR PLUMMER I would rather confine my remarks to the clinical observations that we have made. Cyanosis occurs in a high percentage of the cases following sulfanilamide. It is much less evident following sulfapyridine, sulfathiazole, or sulfadiazine. Cyanosis is a common accompaniment of pneumonia, and, therefore, to estimate the degree of cyanosis caused by sulfonamide therapy in these cases is rather difficult. I am convinced, however, since using sulfadiazine, that some cyanosis is caused by sulfapyridine. In a few cases where we have changed from sulfapyridine to sulfadiazine the patients' appearance changed greatly. With sulfapyridine they were slightly cyanotic and had a gray appearance, with sulfadiazine they became bright and more normal in appearance.

As to the etiology of cyanosis, I think that you should ask someone more authoritative on this subject.

DR. FORKNER Do you care to discuss that, Dr. Gold—the mechanism of cyanosis?

DR. GOLD Methemoglobin has been found, also sulfhemoglobin, diminished oxygen saturation, and a colored derivative of sulfanilamide which might stain the red cells. Each in turn has been suggested as the cause of the cyanosis. But the findings of different workers are not in harmony, and the cause of the cyanosis still remains to be established. It appears to be a fact, however, that the cyanosis is harmless.

DR. RICHARDSON Have these drugs any tendency to produce thrombosis of the vessels?

DR. PLUMMER Following the use of sodium sulfapyridine intravenously there have been reported thromboses at the site of injection. However, as I mentioned before, we have been using a particularly high concentration of sodium sulfapyridine intravenously and have encountered none.

DR. W. S. LOEWE What is known about the time factor in obtaining a satisfactory therapeutic result? Is it known whether a pushlike, short action of a high concentration or whether the prolonged action of a moderate blood concentration is more important for success?

DR. PLUMMER Just how important the time factor is we do not know. Some observations have been made, particularly in cases of subacute bacterial endocarditis. As you know, in this disease the results have

not been particularly striking with the sulfonamide drugs, but there have been a few patients who seem to have been cured, and there have been a number of patients in whom the temperature has dropped down and the blood cultures have temporarily become sterile. Now the observation that has been made is this: that if the drug is given in high concentration at the start, the possibility of obtaining a favorable response seems to be greater than when starting with a low concentration and gradually building it up.

DR. MODELLE Have you found that the use of heparin has made any difference in the treatment of subacute bacterial endocarditis with sulfapyridine?

DR. PLUMMER We really cannot give the answer to that. Dr. Kelson is working at Bellevue, and we are following his work carefully. My present personal impression is that the patients do just as well without heparin.

DR. EGGLESTON I should like to express that view as well. From the study of a considerable number of these cases of subacute bacterial endocarditis, so far as I can see the addition of heparin does not increase the likelihood of recovery. I have seen several remissions in the course of the subacute bacterial endocarditis but no cure.

DR. GOLD Your experience with subacute bacterial endocarditis, Dr. Plummer, corresponds then with Dr. Eggleston's?

DR. PLUMMER I believe that I have seen several patients who have been cured of subacute bacterial endocarditis by the sulfonamide drugs. Some of these patients Dr. Eggleston also has seen, and it may be that we would disagree as to whether or not they were actual cures.

DR. EGGLESTON I have seen cured patients. I simply remarked that in my personal experience I have yet to secure a cure.

DR. PLUMMER What do you think about those at Bellevue?

DR. EGGLESTON I think they are cured. So far as current evidence is able to establish a cure, they are probably cured.

DR. GOLD Let's get the record straight. Are these cures with or without the anticoagulant heparin?

DR. PLUMMER Both ways, and on that basis I believe that the important factor is that of securing high concentrations of drug in the blood and that just as much can be accomplished with the drug alone as with the drug and heparin.

DR. FORKNER It should be made clear

Medical Preparedness

Vacancies in the Medical Corps Reserve

SELECTIVE Service registrants who are qualified physicians and surgeons are urged to apply for commissions in the Medical Corps Reserve, it was announced on April 7, 1941, by National Headquarters, Selective Service System.

State Directors of Selective Service, it was said, have been asked to request local boards to communicate with all such registrants and encourage them to seek admission into the Reserve Corps instead of inducting them as selectees for military training.

Several thousand vacancies in the Medical Corps Reserve were announced recently by the War Department which said that physicians and surgeons commissioned would be given the grade of first lieutenant. The announcement by National Headquarters, Selective Service System, is in cooperation with the War Department to fill this need.

The memorandum from National Headquarters said:

"Recently in several cases, physicians and sur-

geons have been put in Class I-A and inducted into service although they might have served to better advantage both to the Army and to themselves in the capacity of medical officers.

"To assist the War Department in its procurement program, it is desired that you present this situation to the attention of local boards in your state.

"It is suggested that they communicate with registrants who are licensed physicians and surgeons and encourage them to apply to the Corps Area Surgeon for reserve commissions in the Medical Corps. It is particularly desirable to avoid inducting men who can qualify for such commissions and be made available for immediate active duty."

The announcement by National Headquarters pointed out that only those doctors who are graduates of approved medical schools who are licensed or eligible to be licensed to practice medicine in the state in which they live are to be considered for commissions.

Unique Plan of the Mount Sinai Hospital to Cooperate on Defense

THE call to military duty of Dr. Edgar M. Bick, associate orthopedist at the Mount Sinai Hospital, has called attention to a unique plan whereby the entire medical staff of the Mount Sinai Hospital shares its responsibilities in the event of a military emergency. Dr. Bick, a medical reserve officer, is the first member of the attending staff of the hospital to be called to military service.

Under the plan developed by the members of the Medical Board and of the Association of the Junior Medical Staff of the hospital, upon the declaration by the President of a military emergency requiring the calling of medical reserve officers to military duty, all members of the Mount Sinai Hospital medical staff remaining in civilian practice will contribute a percentage of their net income from medical practice to a common fund that will be used to help the families of members called to active military service. Designed to assist such doctors in maintaining obligations to their dependents, the plan enables those who remain behind to share in the common responsibility for defense.

Payments from the fund will be prorated on the basis of the number of years since the doctors' graduation from medical school. This will be paid monthly, without regard to military rank, to each member of the hospital's medical staff called for active full-time military service or to his family or designated agent. The same payments will be continued for six months after honorable discharge from military duty. In the event of death or total disability while in military service, the payments will be continued for two years after death or onset of total disability.

The project will begin on May 1 with contributions into the common fund of a percentage of the net medical income for the year 1940, payable in monthly installments. This will permit the accumulation of a reserve to cushion subse-

quent increases in the percentage contribution as more men are called for military duty. The accumulation of a substantial reserve in excess of immediate requirements will enable members of the medical staff to contribute to a common pool from which they may benefit at some future time if called to military service. Contributions to the common fund will be continued until the termination of the military emergency or until all obligations have been discharged to those who died or were totally disabled while in military service.

The fund will be administered by a committee of three trustees of the hospital appointed by the president of the hospital—namely, Carl J. Austrian, chairman, Robert Lehman, and Jacob Stone. The president of the Medical Board, Dr. George Baehr, and the chairman of the Association of the Junior Medical Staff, Dr. Arthur S. W. Touroff, will assist the committee in an advisory capacity. The operating costs of administration will be defrayed by trustees of the hospital so that all contributions to the fund will be used for the benefit of the participating physicians.

As an additional step to help the families of those in military service through operation of the fund, it has been agreed by the hospital staff that members of the staff on military duty will receive a percentage of the fees paid by their patients in their absence to other members of the medical staff of the hospital and that in the event of death or total disability of a staff member while on military duty these payments will continue until two years after the death or the onset of total disability.

It is believed that the Mount Sinai Hospital is the first institution to make arrangements of this type, whereby the entire medical staff shares in the emergency responsibility. It is expected that others will develop similar plans.

Medical Relief

For the Aged, the Blind, and for Dependent Children

Joint Statement

*From the New York State Department of Social Welfare
and the Medical Society of the State of New York*

IN THE welfare districts in the state where physicians have heretofore been paid by the Welfare Department on a fee-for-service basis for authorized medical care given to persons receiving Old Age Assistance and Assistance to the Blind, a change effective April 1, 1941, has been made in the method of payment—so that such persons will pay physicians directly for such medical care given during the preceding month. This method has been used for some time in administering Aid for Dependent Children.

The basis of this change is that the Social Security Board has held that under the Social Security Act it cannot reimburse the state from federal funds for any monies paid to anyone other than the person eligible for these two forms of public assistance. Since the maximum basis of reimbursement has been raised by law from \$30 to \$40 per month, it is now possible to incorporate medical expenses in the direct grant and secure additional federal reimbursement—estimated at more than half a million dollars per year.

It was recognized by the State Department of Social Welfare and representatives of the Medical Society of the State of New York and the New York State Association of Public Welfare Officials that there might be some difficulties in installing this "Direct Payment Plan" which, for the purposes of securing additional federal funds, was designed to provide for payment directly to the physician by the person in receipt of Old Age Assistance and Assistance to the Blind who, with the approval of the local welfare officer, had received medical services from this physician.

The basic premise of this plan was that these persons would meet their medical obligations in the same way that they have met their obligations for food, rent, and the other necessities of life in the past.

It was agreed by the representatives of the medical profession and the welfare officials that the installation of this plan would require careful preliminary interpretation and cooperative planning in each community.

After a number of discussions last fall, in which the State Department of Social Welfare called attention to its obligation to take advantage of the potential savings of state funds which might be expected from the installation of the "Direct

Payment Plan," the representatives of the Medical Society of the State of New York agreed to go along with this plan, and to urge that the local welfare commissioners discuss fully with local physicians the problems involved to secure their full cooperation.

In the communities where there has been adequate interpretation and full discussion between local physicians and welfare officials the installation of the "Direct Payment Plan" has progressed smoothly.

The representatives of the Medical Society of the State of New York and the State Department of Social Welfare agreed that the medical features of the program would be subject to a careful review after six months operation to determine

- 1 Whether or not the anticipated savings materialize,
- 2 Whether there are difficulties in the operation of the "Direct Payment Plan" which cause individual physicians or local welfare officers concern.

Both the State Department of Social Welfare and the Medical Society of the State of New York will be glad to review and make every effort to solve any locally unresolved problems encountered in the installation and operation of the "Direct Payment Plan" if the specific problems, with identifying details, are submitted to the undersigned representatives.

It is understood, of course, that local physicians will submit most of these problems to their local medical society and local welfare department for primary consideration, since the success of any medical program is dependent on local effort and cooperation. There is no desire on the part of the state agencies to interfere with local autonomy in these matters—they will be glad, however, to offer assistance when requested, if and when local efforts toward a cooperative solution have become exhausted.

CHRISTOPHER WOOD, M D

Chairman,

Subcommittee on Medical Relief, Medical Society of the State of New York

AMERICAN ASSOCIATION FOR THE STUDY OF GOITER

The American Association for the Study of Goiter will hold a meeting in the Hotel Statler, Boston, Massachusetts, May 12, 13, and 14, 1941, instead of the date originally announced.

The program for the three-day meeting will consist of papers dealing with goiter and other diseases of the thyroid gland, of dry clinics, and of demonstrations.

event was arranged by the medical board and alumni association of St Catherine's Hospital. More than 150 persons, chiefly members of the medical profession, attended. A watch was presented to Dr McAteer.

Several case presentations were offered at a meeting of the East New York Medical Society in the Temple auditorium, on April 7.

Speakers included Dr Abraham H Marel, who talked on dermatomyositis and Dr Richard Emmett, dermatologist at Beth-El Hospital. Dr Jack Wolf also discussed recent advances in the treatment of common skin diseases. Dr William Levine presided.

Some 400 borough physicians are cooperating as medical examiners with the 101 Brooklyn local draft boards.

These doctors were chosen from more than 1,000 volunteers by the preparedness committee of the county society. An additional 175 borough specialists have been named to advisory boards.

Monroe County

What's new in cancer control was revealed to Rochester audiences in talks by Dr Clarence Cool Little, managing director of the American Society for the Control of Cancer, on March 30.

His first talk was to a radio audience from Station WHAM, after which he addressed a public meeting at the Rochester Academy of Medicine on "The Optimistic Side of Cancer." This meeting was sponsored by the Rochester Academy of Medicine, county medical society, and University of Rochester School of Medicine in cooperation with the Women's Field Army of the American Society for Control of Cancer.

At 8 45 P.M. on April 1 Dr Little addressed a meeting of doctors at the Academy of Medicine on "The Cancer Problem Today."

Montgomery County

The April meeting of the county society was held at the Elks Club in Amsterdam on April 8. Dr John E. Heslin, professor of urology, Albany Medical College, delivered a paper on "Recent Advances in the Treatment of Infections of the Urinary Tract." The point was stressed that while the sulfur compounds have revolutionized the treatment of these infections, the dangers from procrastination have steadily increased and are being overlooked. Illustrated slides revealed the pathology behind many recurrent urinary infections which responded to the sulfur compounds temporarily. Discussion was led by Dr C. A. Spence, and Dr P. J. Fitzgibbons, health officer, who remarked on the scarcity of cases of acute anterior urethritis.—Reported by Roger Conant, M.D., Secretary.

New York County

The special committee of the county society on maternal welfare met at The New York Academy of Medicine on April 9, with the following program:

- 1 Cardiac Decompensation, Undelivered
- 2 Spontaneous Delivery, Intestinal Obstruction.
- 3 Attempted Forceps Delivery, Version, Sepsis
- 4 Sub-acute Bacterial Endocarditis, Spontaneous Delivery

- 5 Eclampsia, Forceps Delivery
- 6 Latzko Caesarean Section, Shock.
- 7 Eclampsia, Spontaneous Delivery
- 8 Eclampsia? Undelivered.
- 9 Spontaneous Delivery, Sepsis
- 10 Mid-forceps Delivery, Bladder Injury, Psychosis

The New York Surgical Society met at the Academy of Medicine on April 9 and listened to a symposium on diseases of the thyroid.

At the stated meeting of the Academy of Medicine on April 3 the sixteenth Hermann Michael Biggs Memorial Lecture was delivered by Clarence A. Mills, professor of experimental medicine, University of Cincinnati College of Medicine, on "The Relation of Climate and Geography to Health."

The Harvey Society met at the Academy of Medicine on April 10, and heard a paper on "Hormones and the Process of Aging" by Leo Loeb, emeritus professor of pathology, Washington University School of Medicine.

The Harlem Medical Assn. held a symposium on neuropsychiatry at its meeting on April 2.

On March 29 a dinner was held at the Yale Club in honor of Dr Foster Kennedy, who has been director of the Bellevue Neurological Service since it was organized in May, 1916. Dr Edwin G. Zabriskie was toastmaster and addresses were made by Drs Bernard Sachs, Charles A. Elsberg, and Foster Kennedy. Dr Otto Marburg made a few extemporaneous remarks.

Onondaga County

At the "Maternal Welfare Teaching Day" at the Syracuse University College of Medicine on April 3, a chart showing the decline in the death rate of mothers in childbirth for Syracuse was shown by Dr Charles A. Gwynn, professor of clinical obstetrics.

Figures given were 4.1 per cent for 1936, 3.3 per cent for 1939, and 1.8 per cent for 1940. Dr Gwynn pointed out that the declining death rate was opposed to a rising birth rate. There were 3,600 births in 1936 and 4,400 in 1940.

A call for medical volunteers to lighten the work of physicians serving on draft boards is sounded by Dr Edward S. Van Duzen, chairman of the Medical Preparedness Committee in an article in the April issue of the county society Bulletin.

"Complaints of the medical members of the draft boards are growing in extent and volume," he writes. "The work grows heavier and more interfering with their regular practices than was anticipated. And it promises to continue not just until the Army has been increased to its designated size but for several years."

"In Rochester they have increased the number of medical men on their sixteen draft boards to nine men each. In Syracuse we have now received authority to increase the boards and we are increasing the number to six on each of the thirteen boards as fast as we receive the names of medical volunteers."

"We hope all doctors who possibly can will volunteer for this work. It is their patriotic duty, and greater numbers will reduce the burden

Medical News

County News

Albany County

Major Julia C. Stamson, president of the American Nurses' Association and former superintendent of the Army Nurse Corps and director of Nursing Service of the A E F, was the speaker at the sixth of the series of addresses on Health and Defense Mobilization organized by the Public Relations Committee of the Albany Medical College and Hospital, in cooperation with the county society and Brady, Childs, Memorial and St Peter's hospitals, on Friday, March 28, in the auditorium of the Albany Law School.

Broome County

A business meeting of the county society was held on April 8.

A course of lectures on heart disease was given at the Binghamton City Hospital on April 3, 10, 17, and 24, and will conclude on May 8.

The radio speakers on Thursday evenings in April were Dr George C Vogt, Superintendent Robert Johnson of Ideal Hospital, Drs H Jackson King, W J Demer, P J Gorman, E R. Dickson, and Mrs Dorothy Titchener.

Chemung County

Steps toward establishment of a county laboratory, as urged by the county society, will not be taken this year because there are no funds for that purpose in the budget, the Board of Supervisors has decided.

The supervisors' hospital committee is expected to recommend that contracts be made with Arnot-Ogden and St Joseph's hospitals to conduct all 1941 laboratory tests, according to a report in the *Elmira Star Gazette*.

The committee will recommend that each hospital receive \$300 monthly, compared with \$250 paid monthly in 1940. The boost was said to be necessary because of an increase from 9,000 to 14,000 in the number of tests made annually.

Erie County

Emphasizing that no additional appropriation will be necessary, the county social welfare board on April 4 approved the revised medical plan for indigents which would compensate Buffalo physicians for their services.

The plan was submitted to the Board of Supervisors on April 8, and "prospects are bright for its passage," according to the *Buffalo Courier-Express*.

Under the proposed setup, private city doctors would receive a maximum of \$50 monthly for their services to welfare clients. Heretofore they have received no compensation. Home calls would bring them \$2 a visit and office calls, nothing.

Thirteen positions would be created by the proposal, including five staff doctors at \$1,560 annually for home call service and four pharmacists who would be assigned to Meyer Memorial Hospital dispensaries.

The program of the Buffalo Academy of Medicine on April 16 consisted of an analysis of

3,000 prescriptions written by physicians of western New York, compared with a similar analysis made six years ago.

Dr Herbert C Goetz, 46, a specialist in traumatic surgery, who had one of the largest medical practices in Buffalo, died on April 8.

One of the oldest physicians in the state, Dr Robert Hebenstreit, aged 90, died on March 25, in Buffalo. Born in Schlussheldrung, Germany, Dr Hebenstreit came to Buffalo in 1864 with his mother and father, who also was a doctor. In 1872 he received his medical degree from the University of Buffalo. One of the signers of the diploma was Millard Fillmore. He belonged to only one organization—the county medical society.

Herkimer County

The county society met on April 8 at the Mohawk Valley Country Club. Dr Edgar Burke, chief of surgery at the Jersey City Medical Center, gave an illustrated lecture on "Traumatic Abdominal Surgery." A buffet luncheon was served.

Kings County

The scientific program at the meeting of the county society on April 15 was as follows: "The Surgical Aspects of Peptic Ulcer," Dr Thomas A Shallow of Philadelphia, "The Individual Physician's Obligation to Medical Organization," Dr James M Flynn of Rochester.

The second annual spring festival of the county society will be held during the week beginning May 12. There will be a hobby show of paintings, collections, and photography, and bowling and tennis tournaments.

The fifth concert of the Doctors' Musical Society of Brooklyn will be held on May 17 at 8 30 P M at the Brooklyn Academy of Music. A reception and dance will follow. The proceeds will go to the county society's relief fund.

The Associated Physicians of Long Island will hold their spring meeting on Tuesday, June 10, at the North Country Community Hospital, Glen Cove. Dinner will be held at the Nassau Country Club, Glen Cove, at 6 30 P M sharp. There will be short, snappy after-dinner speeches by Lieutenant Colonel William E Lippold, U S A, Commander Ralph C Kephart, U S N, and Bernard (Barney) Capehart, aviation expert of *Collier's*.

The Williamsburg Medical Society will meet at the Leon Louria Auditorium on May 12, at 9 00 P M, for a symposium on headaches "Eye," Dr Mark J Schoenberg, "Ear, Nose, and Throat," Dr Marvin F Jones, "Neurology," Dr Tracy Putnam, "Allergy," Dr Matthew Walker, "Gynecology," Dr Raphael Kurzkro, "Medicine," Dr Tasker Howard.

Dr Daniel A. McAteer, attending surgeon at St Catherine's Hospital and past president of the county society, was guest of honor at a dinner in the Hotel Bossert on March 27. The

Surgical treatment of peptic ulcers 3 Films

Wayne County

Dr James K Quigley, of Rochester, addressed the county society at the Wayne Hotel in Lyons, April 1, on "Problems in Everyday Obstetrics" A very interesting film on allergy was shown following dinner. The society was very pleased with the number of members present. Guests of the evening were Dr Paul A. Lembcke, District Health Officer, Dr E. Quinlevan, assistant, and Dr L. A. Whitney. —Reported by Joseph J. Kaufman, M.D.

Westchester County

Colonel C. M. Watson, chief surgeon at headquarters, Second Corps Area, Governors Island, spoke at the meeting of the county society on April 15 in New York Hospital, Westchester Division, White Plains, on "Expansion of Some of the Medical Department Activities in the Army."

A meeting of the Westchester County Society of Gastroenterologists was held at the New York

Hospital, Westchester Division, in White Plains, on April 25. Dr Arthur J. Patek, Jr., of the Research Division for Chronic Diseases at Welfare Island, was the guest speaker. Dr Patek's topic was "Treatment of Cirrhosis of the Liver by a Nutritious Diet Supplemented by Vitamin B Concentrates." Dr Carl Greene, of New York City, discussed Dr Patek's paper.

Dr Anthony Bassler, of New York City, a Fellow of the American College of Physicians, and president of the National Gastroenterological Society, was the guest speaker at a regular meeting of the New Rochelle Medical Society, at the New Rochelle Hospital on April 14. Dr Bassler's topic was "The Intestine and Chronic Arthritis."

The Special Committee on Cancer of the county society, under the chairmanship of Dr Margaret Loder, of Rye, arranged a special meeting in conjunction with the regular meeting of the Grasslands Hospital Staff, at Grasslands Hospital, April 30, on "Cancer of the Breast." Dr Frank E. Adair, of the staff of Memorial Hospital in New York City, was guest speaker.

NEW HEALTH MOTION PICTURES

The State Department of Health has added to its collection of health motion pictures three new films.

Tuberculosis is intended to develop general understanding and appreciation of the nature, prevention, diagnosis, and treatment of pulmonary tuberculosis. The processes of pulmonary infection and reinfection of the lungs are illustrated by animated photography, and tubercle bacilli, surrounded by body defense cells, are shown by photomicrography. Tuberculin tests and x-ray examinations are demonstrated along with hospital treatment, including pneumothorax. This film is recommended for use from the junior high school through the adult levels of instruction.

Safety in the Home presents graphically the rate and annual toll of home accident injuries. Attention is focused on the most common source of accidents in and about a typical home, and

suggestions are given for their elimination. Because of its objective nature and application to numerous courses of study, this production may be used from the intermediate grade level upward.

Home Nursing in Pneumonia (a revised version of *Pneumonia Nursing—Half the Battle*) shows a public health nurse instructing a housewife in the care of a pneumonia patient. This picture is adapted particularly for display before women's organizations, nursing classes, and adult audiences but is not suitable for mixed school groups.

Each of the three films is one-reel and is available in 16-mm. sound film only. They may be borrowed without charge, subject to the usual conditions. Requests should be addressed to the Bureau of Visual Instruction, at the State Department of Health in Albany, New York.

on each examiner. Also, our weekly session at the dispensary, where any board can send its men (up to twenty) to fill weekly quotas, is working well and keeps our boards well up in fulfilling the regular quotas. The present calls will be completed before July 1, when a letup for the summer is expected."

Ontario County

Dr G Allen Robinson of New York City spoke on the "Present status of radiation therapy in malignant disease" with moving pictures on "Radium and its Therapeutic uses" at the scientific session of the county society meeting in the Clifton Springs Sanitarium on April 8.

The discussion was opened by Dr John J Morton, professor of surgery of the University of Rochester, and Dr Andrew H. Dowdy, assistant professor of radiology at the University of Rochester.

Orleans County

The county society held a dinner meeting on March 27, at the Town Club, in Albion.

The County Department of Public Welfare had three representatives present to explain and discuss with the society the changes in the payment procedure for medical care given to recipients of old-age assistance, aid to the blind, and to dependent children, as required by the New York State Department of Social Welfare.

Dr Gordon Gray of the state health department office at Batavia spoke on the changes made in the treatment of luetic patients formerly cared for by welfare physicians, whereby each physician will now have the privilege of treating his own patient.

After the business meeting, Dr Ward Ekas, of Rochester, spoke on Maternal Welfare. A special invitation was extended to the society to attend the Maternal Welfare Teaching Day, at Rochester, April 9.—*Reported by Dr Ellen M Nicholson, Secretary*

Oswego County

The spring dinner meeting of the county society was held at the Hotel Pontiac on April 3, with a large attendance of members and guests from neighboring counties. Dr Edward F Fox, of Fulton, presided.

Queens County

Dr Leonard B Goldman, of Jackson Heights, a member of the speakers' bureau of the Queens Cancer Committee, gave an illustrated talk on "The Practical Aspects of Cancer" at a meeting of the Queens Medical Society in the Queens General Hospital, Jamaica, on March 27.

The address was followed by a tour of the radiation therapy department of the hospital.

The Health Department and the Queens Cancer Committee joined in sponsoring the session in connection with Cancer Information Month.

The Rockaway Medical Society held its monthly meeting on April 17, at the Lawrence Village Park Clubhouse. Dr Alfred F Calvelli presided.

Dr Clay R. Murray, associate surgeon at the Presbyterian Hospital, spoke on "Fractures in General Practice." A discussion was led by Drs I Ritzfeld and I Balensweig.

The society will hold its annual dinner dance in May at the club house.

Rensselaer County

"Grudgingly commending Germany as the only power which heeded the health lessons of World War I, the president of the American Medical Association thinks it's high time Uncle Sam took the cue," says the Albany *Knickerbocker News*, in reporting the address on April 8 by Dr Nathan B Van Etten before the county society in the Hendrick Hudson Hotel, Troy. He said Britain scorned those lessons and France almost ignored them.

And now, because she took heed, said Dr Van Etten, Germany possesses a strong and virile youth.

Warning colleagues against being "lulled to sleep by stories of security," Dr Van Etten urged physicians to "emerge" from their shells and face the crisis.

"Defense against disease," he said, "is quite as important as defense against a military enemy."

During a question period Dr Van Etten announced that the jury decision in a District of Columbia local court holding the American Medical Association guilty of restraint of trade, will be appealed "unless the House of Delegates rules otherwise." The appeal will be carried through the highest courts of the land and

"If it is necessary we will carry it to the court of public opinion, to the people themselves," he said.

The American Medical Association, he set forth, is an educational institution which never has been in business or trade.

Richmond County

Dr Henry H Rutter spoke at the April meeting of the county society in the Health Center, Stuyvesant Place, St George. His subject was "Fractures in General."

Dr Rutter is an associate in traumatic surgery and a surgeon to the Reconstruction Unit of Post-Graduate Hospital, and consulting surgeon in St. Luke's Hospital, both Manhattan.

The annual dinner of the society has been postponed to May 7. It will be held in the Meurot Club, St George. The society expects to have, as its honor guest, Dr Nathan B Van Etten, president of the American Medical Association.

St. Lawrence County

The quarterly meeting of the county society was held April 17 at the Hepburn Hospital, Ogdensburg. Luncheon was served at the Crescent Hotel.

Dr Richard H Bennett, clinical professor of medicine, Brooklyn, spoke on "Pulmonary Hemorrhage."

Suffolk County

The programs of the Hampton Clinical Society in April were as follows: Thursday, April 10 1 Fracture of Shaft of Femur, Dr Frank Holmberg, Sag Harbor 2 Fracture of Neck of Femur, Dr David Edwards, East Hampton 3 Films Elbow and Knee Surgery.

Thursday, April 24 1 Changes of temperature in extremities following ligation of artery or vein 2 Perforating ulcers of stomach and duodenum,

PROVIDE *the Arthritic Patient*
with RELIEF FROM PAIN . . .

Wyeth's
REG. U.S. PAT. OFF.

A-B-M-C OINTMENT

(ACETYL BETA METHYLCHOLINE CHLORIDE)

A-B-M-C Ointment* relieves arthritic pain because of its local action in increasing the blood supply to the affected part by dilatation of the arterioles and capillaries

In 88 percent of 96 patients studied, A-B-M-C Ointment provided relief from pain without any untoward effects when used as directed. No urticaria was produced in any case †

A-B-M-C Ointment is spread, without rubbing, on the affected part and heat is applied for 20 minutes

Supplied in 1-ounce tubes

†Archives of Physical Therapy 21:12 (Jan.) 1940

*A-B-M-C Ointment is a trademark of John Wyeth & Brother, Incorporated, for its brand of ointment containing Acetyl Beta Methylcholine Chloride 0.25%, menthol, thymol, eucalyptol and methyl salicylate in an emollient base.

Sawdust Beds for the Chronic Sick

THE fond relatives think at first that barbaric treatment is being extended to their loved ones. Sawdust beds! But they are surprised to learn that the loved ones actually like the beds and often ask to stay in them. And they make better progress, too, so that the families experience a sharp reversal of feeling.

Sawdust beds have been in use seven years in The Hamilton County Home and Chronic Disease Hospital in Cincinnati, and Miss Hadassah M. Hofmann, the matron, tells us about them in the *Modern Hospital* for March. She lists their good points thus:

Their Advantages

"The advantages we have found in the use of sawdust beds may be summarized as follows:

"1 They are comfortable, and patients like them so well that they frequently ask to remain in the sawdust bed.

"2 They are cool in the summer and can be made warm and snug during the winter months.

"3 They serve to keep the open wards clean and to eliminate odors.

"4 They are economical because they save linen, laundry, medications, and dressings.

"5 They are labor saving, it is harder to change an entire bed and wash soiled linen than it is to remove a few scoops of sawdust and replace them with fresh sawdust.

"They were introduced as a routine procedure for the care of bedsores under the direction and supervision of the superintendent, Dr. Charles A. Neal, who is also active in public health and social welfare programs. At present there are twenty-four sawdust beds in constant use and they have given excellent results.

"The bed did not originate in our hospital. It is believed that sawdust beds were first used in an institution for the mentally ill somewhere in Indiana. They are being used in many other institutions with most gratifying results."

Modus Operandi

Sawdust made from white pine or any soft wood is sifted to remove splinters, Miss Hofmann continues, and is placed evenly in the crib to the depth of about eight inches. A quilted pad or a folded draw sheet, twenty-five by thirty inches, is placed at the head end of the bed and the pillows are put on it. A sheet, a spread, and a blanket, if necessary, are placed on the bed as covering. These may be pinned or tied to the foot of the bed to prevent their slipping to the floor. The covers are fanfolded and the bed is ready.

The question of cleanliness may arise. The sawdust comes from the inside of boards, it is heated to a high degree of temperature in the process of sawing and is carefully handled, which makes it clean, if not free from bacteria. Taking everything into consideration it is as clean as an ordinary bed. The sawdust used is white pine or other soft wood because hard wood is irritating and walnut stains when the patient perspires.

The patient is placed directly upon the saw-

dust (no lower sheet is used) and is able to move from side to side as in an ordinary bed. A backrest or a chair used as a backrest may be placed in the bed during meal time or for a change of position. A wooden tray stand may be placed across the bed for the food tray at meal time, for writing, for handicraft work, or for any work the patient desires to do.

If the patient has an open lesion, it is washed daily or as often as is necessary with soap and warm water or with warm normal saline solution. Medications and dressings are not used because these would defeat the purpose of the sawdust beds. When the sawdust becomes soiled from wound discharges or excreta the patient is turned and the soiled sawdust is removed with a scoop or dustpan. The patient is then bathed as needed and fresh sawdust is put into the bed. The soiled sawdust is placed in an airtight galvanized container, the contents of which are later disposed of in the incinerator. A bed bath can be given as if the patient were on an ordinary bed.

"Bringing up Father" in a Hospital Class

ADD one more to the number of hospitals that, not content merely to educate expectant mothers, are also educating expectant fathers, says the "Roving Reporter" of *The Modern Hospital* in the March issue. It is the Methodist Hospital in Brooklyn, "at which we are stopping for a few minutes to see what is being done to make the husband understand some of the problems that may confront a wife before the baby comes."

"We made the first approach," Mabel Duryea, supervisor of the maternity building, tells us, "through the wife in the mothercraft class, explaining just what we desired to do and why we desired to do it. We asked her to invite her husband for us, thus making the contact absolutely informal and entirely a matter between husband and wife, and removing any possibility of the husband's feeling that the hospital was urging something on him. We were delighted with the results."

"On December 4 at 8 P.M. we ventured out with a series of four classes, the first two of which were lectures, the last two, practical demonstrations. Fourteen attentive and interested expectant fathers were on hand. By their earnest attention and careful questions we knew the answer—such classes were needed."

"One of the attending doctors on the obstetrical staff gave the two lectures. The first was on 'the anatomy and physiology of pregnancy,' the second, 'tips to prospective fathers.' These were presented in terms that the husband could easily understand and were accompanied by interesting slides."

"The last two evenings of the course were practical demonstrations given by the instructor of mothercraft classes. The first was a demonstration bath and the second was on general care of the baby. The instructor gave a demonstration bath to a doll, explaining the various steps in

detail and then showing how the baby should be diapered and dressed

"These demonstrations were staged to teach the husband to be helpful but not to attempt to do more than he knew how to do well. Special emphasis was given to preparing and giving the bottle and the proper procedure following the feeding of the baby. The demonstration of the 'general care of the baby' was a review that afforded each husband who desired it an opportunity to practice on the doll the procedure that had been demonstrated.

"A certificate was presented to the men who completed the course, and it was extremely gratifying to see how pleased they were to receive this certificate. They were treated to refreshments consisting of coffee and cakes, too."

Already another class is under way, with every indication of increasing registration as prospective fathers become educationally minded.

Newsy Notes

AS A precaution against the possibility of bombing raids, the board of managers of Meyer Memorial Hospital in Buffalo has directed the institution's architects to prepare sketches for a bombproof, self-contained unit in the basement.

Dr. Walter S. Goodale, hospital superintendent, said that without any alteration in the contour of the buildings, the basement could be bombproofed and set up as a self-contained unit for a comparatively small amount of money.

"These alterations would involve air-conditioning of the basement, transfer of the kitchen and storerooms from upper floors, and shifting of some of the present basement activities to other parts of the hospital," Dr. Goodale said. "Most of the utility departments already are located in the basement."

The superintendent has received a communication from Dr. Arnold F. Emch, assistant secretary of the American Hospital Association, pointing out that hospitals in zones of combat must be provided with bombproof shelters and first-aid rooms, decompression chambers, and facilities for treating gas victims.

In anticipation of the hardship which military service will inflict on the families of doctors who are reserve officers, the medical staff of Mount Sinai Hospital has adopted a plan whereby the entire staff shares the financial burden of members called to service.

Under this plan, developed by members of the Medical Board and the Association of the Junior Medical Staff, all staff members who remain in civilian practice will contribute a percentage of their income to a common fund to help the families of those called to service.

Three trustees will control the fund, and administrative costs will be defrayed by the hospital.

Justice Francis G. Hooley, in Queens Supreme Court, set aside on March 21 the election on March 3 of new officers and directors of Flushing

Hospital and held the original slate of officers and all but four of the trustees to be the legal directors of the hospital. At the March 3 meeting a group of newer members of the association passed two bylaws and, acting on them, increased the number of trustees from twenty to twenty-seven, elected fourteen new members to the board, and displaced L. Gale Hunter as president by George K. Weldon.

The older trustees took the fight to court, contending that the passage of new bylaws without previous notice was contrary to the constitution and bylaws of the hospital association. Justice Hooley upheld this contention.

The William Hempstead Post, V. F. W., has presented an iron lung to the Ilion Hospital.

The Huntington Lodge of Elks has given a fracture table to the Huntington Hospital.

After eighteen years of service in and about Amityville, the Reed General Hospital in that village has been closed. Its founder and proprietor, Dr. Theodore D. Reed, who is also a coroner of Suffolk County, is serving as a captain in the Army Medical Corps at Fort Hancock, New Jersey. The hospital has operated as a nonprofit, nonsectarian, charitable institution, and had been operated at a deficit for many years, Dr. Reed said.

The Assembly Ways and Means Committee has killed a bill for an appropriation of \$750,000 for construction of a state cancer hospital in Utica, according to an Albany news dispatch.

"The amount of hospital facilities per unit of population continues its steady increase, the demand per unit of population likewise is growing," the Council on Medical Education and Hospitals of the American Medical Association reports in its twentieth annual presentation of hospital data, published in the *JAMA* for March 15.

"The total number of beds now available in registered hospitals," the report states, "is 1,226,245, an increase of 31,219 beds, which is the equivalent of an 85-bed hospital for each day of last year, Sundays and holidays included, not forgetting it was leap year. The total number of registered hospitals is 6,291, an increase of 65 during the year. The average census of patients was 1,026,171."

Improvements

GOVERNOR Lehman has urged the Legislature to approve submission of a \$50,000,000 bond issue to the electorate next fall to finance additional mental hospital construction.

The proposal, recommended by the state commission to formulate a long-range health program, was supported by the Governor be-

[Continued on page 1016]

The Fisher Plant

The very life of certain species of Fisher Plant depends on their capacity to hold and maintain a positive "water balance" in their jug-like appendage.

WHY DO WE STRESS "HYDROPHILIC COLLOID"?

THE value of Mucilose in the treatment of constipation is dependent on its hydrophilic property—its capacity to "drink" water which causes it to swell to several times its original bulk.

Taken with plenty of water, Mucilose helps re-establish the "water balance" of the feces, producing a soft, bland, easily-passed, normal stool.

Mucilose avoids the objections to oily lubrication, does not inter-

fere with the absorption of vitamins from the bowel, does not impair digestion, does not leak through the anal sphincter.

For the relief of bowel strain, prescribe

MUCILOSE

Available for prescription specification as Mucilose Flakes, Mucilose Granules, Mucilose Granules Improved (40% Dextrose).

cause "there seems to be no other way of caring for the insane patients for whom the state is responsible"

The executive also asked adoption of other commission recommendations to postpone demolition of Manhattan State Hospital, Ward's Island, from 1943 to 1948 and appropriate \$200,000 for repairing it

The Governor explained under the present state building program the estimated overcrowding in state mental hospitals by 1946 would be 20 5 per cent, or a shortage of about 15,000 beds

WPA improvement projects under way at four Queens hospitals—Neponsit Beach, Creedmoor State, Triborough, and Queens General—are being speeded up as spring brings favorable weather for outside construction work and improvement of grounds, Raymond C Branton, Acting WPA Administrator for New York City, announces

The projects, to be completed at an estimated combined cost of \$1,240,000, will provide better accommodations and more pleasant surroundings for thousands of crippled children, tuberculosis sufferers, mental cases, and many other types of patients at the four hospitals, as well as for the staff

Millard Fillmore Hospital, Buffalo, contemplates building an addition.

Corning Hospital's facilities have been expanded by the addition of seven single rooms in the west wing of the first floor

Plans for a new \$1,250,000 seven-story hospital building as part of the New York Post-Graduate Medical School and Hospital are announced by

Dr Arthur F Chace, president of the board of directors

The building will house additional x-ray laboratories, classrooms, and clinics to accommodate an overflow under which the hospital has been operating It is scheduled to open in May, 1942

Archbishop Francis J Spellman laid the cornerstone on March 19 for the proposed nine-story pavilion that will adjoin St Vincent's Hospital in New York City and increase its bed capacity to 600

Former Governor Alfred E Smith, presiding later at exercises in the hospital auditorium, told 500 friends of the institution that he had been "very nervous" during the laying of the stone

"I was afraid," he said, "that the walking delegate of the bricklayers' union would come along and ask our Archbishop for his union card. But we seem to have gotten away with it."

The drive for \$50,000 to construct an addition to the Julia Butterfield Memorial Hospital at Cold Spring has reached its goal The wing will double the bed capacity of the institution

Veterans' organizations, chambers of commerce, civic and other groups are backing Representative E Harold Cluett in his efforts to secure a \$4,000,000 veterans' hospital for the twenty-ninth New York district Troy is making a strong bid for it

Leased from Columbia University, the structure at 500 West Fifty-Seventh Street, which formerly housed the Herman Knapp Memorial Eye Hospital, was dedicated on March 27 as the city's newest private hospital. Completely renovated, the hospital, to be known as the New Amsterdam Hospital, has been leased by a group of physicians

CHARACTERISTICS OF QUACKS

One of the characteristics of the quack in the field of medicine is his attempt to camouflage his ignorance by quoting the writings of reputable physicians and trying to make it appear that his work and that of the ethical physician is one and the same thing, Dr Richard B Phillips, Rochester, Minnesota, points out in the March issue of *Hygeia, The Health Magazine*.

Other characteristics by which the quack may be identified are summarized by Dr Phillips as follows "The quack lets everyone know that he is in town by large letter advertising in newspapers, circulars, etc Although he is quick to criticize organized and ethical medicine, he adopts the dress, office equipment, and titles of

the profession in so far as he is able He hands out literature that is ostensibly scientific and attempts to confuse and bewilder the 'sucker' with pseudoscientific statements He presents, as a method of cure, something that is easy and simple to take and surrounds this nostrum with an aura of magic and mystery He always promises a definite cure in a definite time and usually with a definite number of treatments He is always exceedingly positive and direct in answering questions, and his sureness of manner often disarms the intended victim In cases in which an ethical physician will often admit that there is some doubt about a given situation, the quack is always positive and definite"

...nascent OXYGEN Therapy for LEUKORRHEA

STA-O-GEN

For office treatment,
and the answer to

What can I trust
my patient with,
to use at home?

CLINICALLY TESTED*

CONCLUSIONS

"effective in the treatment of leukorrhea in general (a) eliminates unpleasant odor of discharge, (b) cuts down or eliminates irritation inside and without vagina, (c) reduces quantity and density of discharge, including that following cauterization.

"It is non irritating and non toxic in contradic-
tion to the arsenic and picrate preparations, equal-
ly effective and actually soothing, especially (a) in
the infantile vagina, (b) in the senile vagina, (c) in
trichomonas vaginalis vaginitis of pregnancy."
* Treatment of Leukorrhea with Ozonide of
Olive Oil David Nye Barrows, N Y State Journal
of Medicine, Vol. 41, Jan 15, 1941

PROPERTIES At body temperature, in the pres-
ence of moisture, every particle of this bland
ozonide of olive oil releases a relatively huge
amount of germicidal, fungicidal and deodorizing
nascent oxygen, steadily and unremittingly for
many hours

Maternal Welfare

At the Erie County Medical Society's meeting on March 17, 1941, its Committee on Maternal Welfare for 1940 gave the report printed below

REPORT OF MATERNAL MORTALITY COMMITTEE—1940

The Obstetrical Council has completed the study of Maternal Mortality in Buffalo for 1940. This marks the fifth consecutive year of its work. The Committee feels that its work has been gratifying and presents the following report to the County Society.

After careful investigation we have found that there were 43 maternal deaths in 10,548 deliveries, an incidence of 0.4 per cent. This compares favorably with our good record of last year and shows a decided improvement over 1935 and 1936, during which years there were 63 and 69 maternal deaths in the same number of deliveries. Excluding the Abortions and Extra-uterine pregnancies, the number of obstetrical deaths would then be reduced by 12 to 31.

Concerning the causes of death we find that Infection, Hemorrhage, and Toxemia still rank the highest. Infection was responsible for eight

deaths or 18.6 per cent. Of these eight deaths, six, or three-fourths of them, occurred in the Cesarean Section group, and two occurred in the Spontaneous deliveries. These results only emphasize the past warnings of the Obstetrical Council in their previous reports that Cesarean Section should be looked upon as a serious operation, carrying with it a much higher incidence of both morbidity and mortality and that this type of operative delivery should be limited to a small group with very restricted and well-defined indications.

Toxemia was the cause of death in seven cases, an incidence of 16.3 per cent. Prenatal care was introduced with the distinct purpose of reducing the deaths from toxemia. It was felt that proper prenatal care would reduce to a minimum this number. We have apparently made only little progress toward this end as proportionately there

Hospitals and Sanitariums

Institutions of Specialized Treatments

QUANTITY AND QUALITY

HOW MANY sanitariums in these United States? Perhaps the medical profession is not quite as interested in quantity as in quality, but quantity is often the yardstick of quality, opinions to the contrary notwithstanding. The very fact that there are so many private institutions able to operate during a period still far from prosperous surely is evidence that the sanitariums measure up to a standard of value acceptable to physicians and their patients.

The United States seems well taken care of with institutions maintained to care for the sick and the injured. As of the beginning of 1941, the record (from Ponton's *Dun & Bradstreet Statistics*) shows 8,867 hospitals and

sanitariums of all classes. Over forty-three per cent, or exactly 3,841 of this total, are sanitariums.

Taking first the entire field of institutions, we find that the New England States have 814, the Middle Atlantic States 1,846, the Middle Western States 1,654, the Western States 1,632, Pacific Coast States 1,048 and the Southern group of States have 1,873. Excluding hospitals, we find that sanitariums in the sub-divisions of the country number 398 in New England, 930 in the Middle Atlantic States, 704 in the Midwest, 484 in the Western States, 445 on the Pacific Coast and 880 in the South.

In New England the division between hospitals and

Continued from page 1018]

are as many deaths in this group as there were in previous years. The last two years have shown a decided increase over previous years and the Committee feels that greater effort should again be made to educate the laity to the benefits of proper prenatal care.

Our study shows that over half of the toxemic deaths had inadequate or no prenatal care. Five out of seven cases got to the convulsion stage before treatment was instituted. It is a well-known fact that toxemic patients are problem cases regardless of the type of treatment, and our only hope is to prevent them from reaching the convulsion stage. The Committee feels that there has been a laxity in maintaining the educational program and advises that proper measures be taken toward further improvement of this condition.

The Committee also felt it necessary to call attention to the fact that five out of seven cases were delivered by operative measures. Of these, four were by Cesarean Section. In all of these deaths the Committee criticized the method of delivery as it felt that insufficient attention was given to the treatment of the toxemia. As a matter of fact, one of these patients had convulsions on the way to the operating room and also on the operating table. There can be no question that a patient in this condition is not a candidate for major surgery. In this group the indication for Cesarean Section had been widened in order to facilitate quickly a delivery. As a supposed life-saving measure in this group of cases it turned out to be the opposite.

Hemorrhage occurred in six cases, an incidence of 14 per cent. The Committee criticized severely the lack of transfusions. In several instances it was felt that transfusions may have saved a life. In previous years the Committee urged the establishment of blood banks in order

to overcome the difficulties in obtaining blood. Several of the hospitals have banks. Others should start them. The Department of Health, with its laboratories, are in a position to have blood in a central station available to both hospitals and private physicians for delivery in the home. If this is not possible then the hospitals with blood banks should offer this service to all outside cases.

Embolism occurred in six cases, an incidence of 14 per cent. These are accidental deaths and in many instances not preventable. Three cases occurred in spontaneous deliveries and three in Cesarean Section.

Abortion and Extra-uterine pregnancies were responsible for twelve deaths. All of the abortions were self-induced or criminal and all died of infection. The Extra-uterine deaths were due to hemorrhage and shock and infection. Both of these causes of death are maternal but not obstetric.

Concerning the methods of delivery, the Committee wishes to point out that Cesarean Sections accounted for sixteen deaths or 37.2 per cent. Excluding the deaths from Abortions and Extra-uterine pregnancies, Cesarean Sections accounted for 50 per cent of the obstetrical deaths. Every report for the past five years has called attention to the dangers of Cesarean Section. This is a hospital problem and can be controlled by them. The County Society can take it upon itself to urge the hospitals to supervise more closely their operating rooms as well as to require consultation before Cesarean Sections are done. In this way its widespread use can be controlled and limited to recognized indications.

In 1940 postmortem examinations increased to 32.4 per cent. The Committee wishes to impress upon all practitioners the need for autopsies so that each case can be carefully evaluated.

Five buildings (two devoted exclusively to private rooms). Resident Physician Rates \$18 to \$35 Weekly. **MRS M K MANNING, Supt.** - TEL: Rockville Centre 3660

sanitariums is practically even. In the Middle Atlantic region there are more sanitariums than hospitals. In the Midwest and the South the division is fairly even also. In Western and Pacific Coast States the hospitals are a decided majority.

If size of the institutions means anything, the following break-down may be interesting. Covering both hospitals and sanitariums, there are 3,467 (close to half the total) with less than twenty-five beds. More than half have over twenty-five beds. Of this number (5,395) about sixty per cent have more than fifty beds. Only 1,930 institutions have more than 100 beds.

Of the largest institutions, with over one hundred beds, the Middle Atlantic States (New York, New Jersey,

Pennsylvania, Delaware, Maryland, and the District of Columbia) have practically thirty per cent, 569 in all. Of the smallest size institutions, the Western States (Minnesota, Iowa, Missouri, Kansas, Nebraska, North and South Dakota, Colorado, Montana, New Mexico, Wyoming, and Oklahoma) have the greatest total, some twenty per cent (701). The Southern region and the Middle Atlantic States combined have over forty per cent of the nation's hospitals and sanitariums with more than twenty-five beds.

Analyzing our own State of New York, we noted that naturally as in so many things it has the most hospitals and sanitariums of any state in the Union. Its 624 insti-

Conclusions

In conclusion, the Committee would like to emphasize the following

- 1 The seriousness of Cesarean Section
- 2 The importance of proper Prenatal care
- 3 The conservative treatment of Toxemias of pregnancy Toxemic patients are not good candidates for surgery
- 4 The importance of blood banks

The Committee wishes to express its thanks to Dr Robert C McDowell for his conscientious work as investigator for the Committee. The Committee also wishes to acknowledge its debt of gratitude to Dr Francis E Fronczak, the Board of Health, and the Bureau of Vital Statistics of the City of Buffalo, without whose encouragement and assistance these records could not have been compiled.

LECTURES ON TROPICAL MEDICINE

A course of lectures on recent advances in tropical medicine, on May 19 to 23, is announced by the New York Post-Graduate Medical School to be under the direction of Dr Z Bercovitz. Lectures will be given on malaria, yellow fever, intestinal parasites (Helminths), filariasis, amebic dysentery, bacillary dysentery, tropical skin diseases, kala azar, leptospirosis, relapsing fever, rat-bite fever, trichinosis, echinococcus, deficiency diseases, lymphogranuloma venereum, sanitary engineering, and tropical hygiene.

The purpose of this course is to bring to phy-

sicians a review of the fundamentals of the various subjects in tropical medicine and the more recent advances that have come from research. To this end arrangements have been made to have authorities in their respective fields give lectures and demonstrations in their specialties. Clinical and laboratory material is available for study and demonstration, and the students are given an opportunity for practical work in clinical parasitology.

The fee will be \$50. Applications should be addressed to The Director, 309 East 20th Street, New York City.

(Continued from page 1021)

tutions comprise seven per cent of all the hospitals and institutions in the country. California is a close second with 571 institutions, Pennsylvania third with 415, Texas fourth with 401, Massachusetts fifth with 393, Illinois sixth with 352, Ohio seventh with 327, Michigan eighth with 299, Wisconsin ninth with 267 and Minnesota a close tenth with 266.

The surprising showing of Texas is largely due to its predominantly great number of small institutions. Almost a half of its total is made up of hospitals and sanitariums having less than twenty-five beds. Delaware has the smallest number of institutions of any state with only 17 listed. New York State has over 75 per cent as many hospitals and sanitariums as New England.

NATIONAL DEFENSE

UNDER THE GLAMOUR of training men to defend our "ray of life" with lethal weapons, it is easy to forget that there are other necessities for training to enjoy "life, liberty and the pursuit of happiness."

We hear much these days about "technicians" in a military sense, but even less than before about the civilian technician so important for the defense of the Magnot, Segined and other lines of our own little worlds. The schools that are training men and women for the battle stations of the hospital laboratories and pharmaceutical research departments are doing as much to make our nation invincible as are the great strategists of our army and naval departments. This may seem a trite statement, but it is nevertheless one that can bear repeating again regardless of the seriousness of the times.

Schools must mean something more than just training for a career. The fundamental purpose should be to create a stronger nation mentally and physically. It has been said that too much intelligence is dangerous. What

in hospitals exclusively, California takes the lead with 288, thirty-eight more than New York State. Pennsylvania and Minnesota are third and fourth in this classification with 233 and 213 respectively. Ohio comes next with 191 and Iowa sixth with 182. Next in order are Illinois with 176, Texas with 175, and Michigan and Massachusetts with 164 each.

Greater New York has 230 institutions, 149 hospitals, and 81 sanitariums. Compared with states this is practically as many institutions as New Jersey and more than thirty-five other states of the Union.

With 374 sanitariums in New York State, 81 of them within the city limits, physicians of this State are amply supplied with sanitarium facilities.

the corner of this phrase really should have said is "that too much *misguided* intelligence is to be feared."

This we have witnessed for the past several years in the actions of the dictators—that is if we can classify the warped thinking of such individuals as an "intelligence." The story of the early life of a Hitler reveals that what the future world has to be guarded against is misguided beginnings.

It is probably beside any point to expect the medical profession to shoulder the entire burden of the responsibility of charting the destinies of younger generations, but there is much a physician can do without going out of his way to help maintain the "status quo" of the "American way of education."

By recommendation he can encourage the fine work of specialized schools. By reference and by employing whenever possible the graduates of such schools, he can encourage students to continue in such studies as well as others to become serious students.

CAPABLE ASSISTANTS

Our free placement service will be glad to help you select exactly the right assistant. Paine Hall graduates are girls of character, intelligence experience—thoroughly qualified to assist in office and laboratory; trained in haematology blood chemistry, urinalysis clinical pathology, medical stenography bookkeeping. Address inquiries to C. R. Porter, Principal.

IN WHOOPING COUGH

ELIXIR BROMAURATE

IS A UNIQUE REMEDY OF UNIQUE MERIT

Cuts short the period of illness, relieves the distressing cough and gives the child rest and sleep. Also valuable in other PERSISTENT COUGHS and in BRONCHITIS and BRONCHIAL ASTHMA. In four-ounce original bottles. A teaspoonful every 3 or 4 hours.

GOLD PHARMACAL CO., New York

Books

Books for review should be sent to the Book Review Department at 1313 Bedford Avenue, Brooklyn N Y. Acknowledgment of receipt will be made in these columns and deemed sufficient notification. Selection for review will be based on merit and interest to our readers.

RECEIVED

Natural Resistance and Clinical Medicine By David Perla, M D, and Jessie Marmorston, M D. Quarto of 1,344 pages. Boston, Little, Brown and Company, 1941. Cloth, \$10.

Malignant Disease and Its Treatment by Radium. By Stanford Cade, F.R.C.S. Quarto of 1,280 pages, illustrated. Baltimore, Williams & Wilkins Company, 1940. Cloth, \$10.

Hutchinson's Food and the Principles of Dietetics. Revised by V H Mottram, M.A., and George Graham, M D. Ninth edition. Octavo of 648 pages, illustrated. Baltimore, Williams & Wilkins Company, 1940. Cloth, \$6 75.

Textbook of Medicine. By Various Authors. Edited by J J Conybeare, D M. Oxon. Fifth edition. Octavo of 1,131 pages, illustrated. Baltimore, Williams & Wilkins Company, 1940. Cloth, \$7 50.

Schizophrenia in Childhood. By Charles Bradley, M D. Octavo of 152 pages. New York, Macmillan Company, 1941. Cloth, \$2 50.

The Mask of Sanity. An Attempt to Reinterpret the So-called Psychopathic Personality. By Hervey Cleckley, M D. Octavo of 298 pages. St. Louis, C V Mosby Company, 1941. Cloth, \$3 00.

Science and Seizures. New Light on Epilepsy and Migraine. By William G Lennox, M.D. Octavo of 258 pages. New York, Harper & Brothers, 1941. Cloth, \$2 00.

Infantile Paralysis. Edited by W L Colze. Volume A40 of the *International Bulletin for Economics, Medical Research, and Public Hygiene*. Octavo of 179 pages, illustrated. New York, National Foundation for Infantile Paralysis, Inc., 1939-1940. Paper.

Roentgen Interpretation. By George W Holmes, M D, and Howard E Ruggles, M D. Sixth edition. Octavo of 364 pages, illustrated. Philadelphia, Lea & Febiger, 1941. Cloth, \$5 00.

REVIEWED

The 1940 Year Book of Industrial and Orthopedic Surgery. Edited by Charles F Painter, M D. Duodecimo of 484 pages, illustrated. Chicago, The Year Book Publishers, 1940. Cloth, \$3 00.

Although the title of this work is *Industrial and Orthopedic Surgery*, the reviews on industrial surgery take up the greater portion. The book gives the abstract of some 276 papers published in the recent past. Most of the papers pertain to industrial surgery, and a small portion is devoted to abstracts of papers dealing with general orthopedics.

It is of value to the surgeon who has no time to read current periodicals, which applies to most surgeons. It is recommended particularly to those who do industrial and traumatic surgery. There is not enough review of orthopedic literature to benefit the orthopedic surgeon.

J B L'EPISCORO

Applied Pharmacology. By Hugh A. McGugan, M D. Octavo of 1914 pages, illustrated. St. Louis, The C V Mosby Co., 1940. Cloth, \$9 00.

This book thoroughly covers the subject of pharmacology, which, as the author states, "is the scientific basis of therapeutics." It presents the material in a logical way connecting physiology, biochemistry, and pharmacology with the clinical application as the ultimate goal. The early chapters are devoted to a consideration of the theories and modes of pharmacologic actions, absorption, conditions modifying the action of drugs, the classification of drugs and the pharmacopoeias. Then follows the pharmacology of the skin, the heart and circulation, and so on through the various systems. Under each will be

found drugs most used for various disorders. Anaphylaxis and allergy, the chemotherapy of syphilis, the vitamins and hormones are but a few of the important topics considered. It is a valuable book for those who are interested in modern pharmacology and its application.

FREDERICK SCHROEDER

The Medical Clinics of North America. November, 1940. Volume 24, Number 6 (Philadelphia number). Octavo. Illustrated. Philadelphia, W B Saunders Co., 1940. (Six numbers a year). Cloth, \$16 net, paper, \$12 net.

For those who want to refresh their memory or once and for all stamp in their mind the essential facts about arthritis in all its aspects, this volume will be a great boon. Almost 100 pages are devoted to this common disease alone.

In addition, Rowntree discusses Addison's disease, and Flippin summarizes his good work on chemotherapy in pneumonia.

ANDREW M BABEY

Progress in Medicine. A Critical Review of the Last Hundred Years. By Iago Galdston, M D. Octavo of 347 pages. New York, Alfred A. Knopf, 1940. Cloth, \$3 00.

Dr Galdston, the educational director of The New York Academy of Medicine, reviews medical progress during the past century. Written in a warmly human tone, the emphasis is on the ideas underlying developments in bacteriology, nutrition, psychiatry, and internal medicine. At the same time Dr Galdston places full emphasis on the social relations and responsibilities of medicine.

Editorial

Medicine on the Air

During the One Hundred and Thirty-fifth Annual Meeting of the Medical Society of the State of New York in Buffalo, radio played a significant part. Cooperating wholeheartedly in a program of regional education, radio stations WKBW, WBNY, WBER, and WBEN gave freely of their time and extensive facilities. The Committee on Radio of the Erie County Medical Society had organized and carried out a varied program of radio talks on matters of scientific and general interest, including a public forum meeting on Wednesday, April 30, with the following addresses: "The Doctor at War," by Dr. Nathan B. Van Etten, president of the American Medical Association, and "How to Live Longer," by Dr. James M. Flynn, president of the Medical Society of the State of New York, and was concluded with the forum "How's Your Health," in which questions from the audience of five hundred people

were discussed and answered by members of a panel of eleven physicians of Buffalo.

WBEN, the Buffalo NBC station, re-broadcast by transcription on successive Sundays from 4:00 to 4:30 P.M. the State Society's program, "Doctors for Defense," originally broadcast by WMCA, New York City. Altogether, Buffalo radio stations devoted two hours and fifty minutes to this program which the Radio Committee of the Erie County Medical Society adapted successfully and skillfully to the exacting demands of radio technique.

The Medical Society of the State of New York can well be proud of such a demonstration of well-organized radio coverage of the meeting and is deeply appreciative of the courtesy of NBC's station WBEN for its generous donation of time for the rebroadcast of "Doctors for Defense."

A Good Veto

Again the medical profession and the people of the State of New York have reason to applaud the good sense and sound judgment of Governor Herbert H. Lehman for his veto of Mr. Quinn's bill, Assembly Int. 167.

This bill was "An act to amend the civil practice act, in relation to permitting disclosure by physicians and nurses of

professional information in certain cases." The bill would allow doctors and nurses to disclose confidential information obtained in their professional capacities to any state or local investigating committee.

In spite of the expressed disapproval of the Medical Society of the State of New York and the Medical Society of the County of New York, and under protest

of the Committee on Legislation of the Bar Association of the City of New York, the bill passed both houses of the Legislature. There was never any uncertainty or division of opinion on the part of medical men of this state on the harmfulness of this measure. The Committee on Legislation of the Medical Society of the County of New York, as well as the Coordinating Council of the five county medical societies of Greater New York, have gone on record as disapproving the bill, and the Legislature was well aware of this attitude of the medical men of the state.

In spite of this information and knowledge, the bill was passed. Why? There are always reasons for actions. They do not simply occur. Perhaps in this case the Legislature passed the bill feeling that the Governor would veto it. Why then pass it? As a gesture of good will to some pressure group? Politics makes strange bedfellows! Who was in bed with the boys this time? Not the Bar Association or the Medical Society of the State of New York! Well, then, what group might possibly desire "legislative investigation by the State or a political subdivision thereof"? Could it be the state medicine men who sleep with their boots on, the horny, hairy socializers who would welcome such a weapon as the "legislative

investigation" for their state-control blitzkrieg since the Sullivan law denies them the more usual armament of the snipers and finger-men?

We ask the people of the State of New York why the Legislature, judging from its actions, desires to parade the people's confidential disclosures to their physicians, their pitiful frailties and human failings across the thumb-marked pages of legislative investigations? Is this a decent respect for the constituencies which elected them? We ask the people to think about these actions. To think about them in the light of what might be expected under a system of compulsory "health" insurance, the very name of which is a political deception, an expensive vote-catching subterfuge, the real nature of which is a sickness tax. Think about this, wage-earner, you who toil by the sweat of your brow, you the people.

After you have considered, join with the medical profession of the State of New York in praise of the courage and honesty of Governor Lehman who has used the veto power again in behalf of the preservation of the individual rights of the people, rights contemptuously trodden under foot by the Legislature when it passed the Quinn bill as its last full measure of devotion to state socialism.

The Deepening Shadows

"In the shadows that are deepening over Europe, the lights of learning are fading one by one. The conception of knowledge as an international responsibility has vanished. The free flow of ideas across boundary lines between laboratories and universities has dried up. Everywhere the exigencies of the war have erased the possibility of intellectual and cultural life as that term was understood a few years ago.

"For an organization like the Rockefeller Foundation to sit by and watch the disappearance or decadence or, worse, the perversion of institutions of learning which in earlier and better years we were

privileged to assist is not an easy assignment. These institutions gave high promise in public health, in medicine, and in the natural and social sciences in a world in which thought was free.

"Even more difficult is it to see the brilliant men with whose work we were associated now driven from the posts for which they were trained, debarred from their laboratories, some of them fugitives, some in concentration camps, many of them separated from their families or lost in foreign countries where they sought haven. To these scholars scattered in many lands, whose lives are now a sacrificial testimony to the principle of

intellectual freedom, we in this protected hemisphere pay tribute of admiration and homage

"It is no longer possible to make payments on appropriations for work in the occupied areas of Europe Norway, Belgium, Holland, Denmark, France, Roumania—the projects which were being supported in these countries in medical research and in the natural and social sciences cannot now be assisted

January, 1941, finds a large number of universities and institutes closed and many others working under conditions scarcely tolerable

Allowed at first to continue with their work, their teaching and student activities were closely supervised

The supervision involved an attempt to enforce a "cultural program" similar to that imposed by the Nazis on German institutions Where this attempt was resisted, as it frequently was, the measures of repression adopted by the occupying authorities included the closing of the institutions, sending faculties to concentration camps, and even breaking up student demonstrations with machine guns and tanks

"The condition of university life and standards on the Continent is now little short of appalling Due to flight, imprisonment, or disappearance the number of professors in institutions has been reduced by at least 50 per cent Professors residing in German-occupied ter-

ritory who were known to be anti-Nazi have been taken to concentration camps or have disappeared

Similarly in Lithuania, Latvia, and Estonia the process of converting the universities into Soviet institutions has proceeded rapidly More than half the professors have been removed from their positions, and many of them have been imprisoned or have disappeared

"Over the Continental universities hangs the pall of uncertainty and fear The contact with contemporary life has been abruptly broken when the German Minister of Justice tells the Association of University Professors that the old ideal of objectivity was nonsense and that 'today the German university professor must ask himself one question Does my scientific work serve the welfare of National Socialism?' He is voicing a doctrine which if broadly applied spells the end of Western scientific thought

"It is only in an atmosphere of freedom that the lamp of science and learning can be kept alight In all the history of the race knowledge has never flowered in a subject people It is only free men who dare to think "

Thus, does Dr Raymond B Fosdick of the Rockefeller Institute picture the fate of European universities under the impact of National Socialism, under a panzer pandect, in the shadow of the mailed fist Today, Europe, tomorrow ?

Medical Libraries of New York State

"Beware," said some ancient sage "of the man who reads only one book." We are not aware that he made any pronouncement concerning the man who reads no books at all, but of the two we would prefer the ignoramus to the bigot

Happily in the State of New York the number and distribution of medical libraries is well and clearly shown in the article published in this issue of the JOURNAL on page 1098 by Florence A. Cooksley, M A., of Rochester We do not know of any previous study of medical

libraries of the state which shows their distribution and the character of the services rendered on so comprehensive a scale as this one which it is our privilege to bring to the attention of physicians Mrs Cooksley has rendered a most commendable service to those who, we hope, do not confine their reading solely to the semimonthly pages of this JOURNAL

No one in the state can complain that adequate medical library service is denied him We hope that every member of the Medical Society of the State of New York will read Mrs Cooksley's article care-

fully Table 1 affords a rapid and accurate means of finding at once what libraries and services are at hand in any locality in the state as well as other data relative to use, support, and lending

privileges The editors of the JOURNAL are pleased to be able to present this exhaustive study for the use and convenience of the students of medicine in the state

"The Lady or the Tiger?"

We are advised by Mr Walter D Shackleton, chief of the Bureau of Public Information of the New York City office of the Selective Service, that stark tragedy after the pattern laid down by the late Frank Stockton walks with grim and fearful tread in the wake of the draft He cites the following letter

"Local Board Chief I am secretly married because my mother-in-law hates me I have been classified as 1-A, and have a very low order number If I

keep my marriage secret I will have to go to camp If I announce my marriage I will have the old lady after me What do you advise?"

What, indeed? We feel that the medical profession, faced with this human dilemma, could well afford to brush up on its Greek tragedies and don the mask of a *deus ex machine age* Knowing the facts of the matter, let the local draft board physicians do their good deed and pass him—quickly, secret marriage and all—into the mills of the gods

History of Medicine

This year for the first time a new and important session was added to the scientific program of the Annual Meeting, a session on the history of medicine in the state

The State of New York has played a notable part since colonial days in the history and development of the science and practice of medicine, both civil and military It is fitting that this story should be chronicled and discussed at our meetings and that those physicians who are interested students should be afforded the opportunity to present their work

In this connection, may we suggest and stress the great opportunity that exists in nearly every community to utilize the meetings of the local historical societies to present to the public the story of

medicine both ancient and modern County medical societies could well afford to follow the example of the State Society by organizing sections on the history of medicine Material collected by these sections could be made readily available to speakers for use in the various community meetings of the historical societies We hope that this will be done, not only because of the opportunity it would afford physicians to better themselves as public speakers but also because it would open one more channel of direct communication between medicine and the public Such direct channels, we opine, will be an increasing necessity as the broad and sinister wedge of government is driven more deeply between the physician and his patients

Round Table—Preparing the Disabled Worker for Re-employment

THE ROLE OF PHYSICAL THERAPY IN THE EARLY TREATMENT OF THE INJURED WORKMAN

MADGE C. L. MCGUINNESS, M. D., New York City

REHABILITATION would be unnecessary in the majority of cases if we were all endowed with ordinary common sense and had enough to eat. One might say common sense alone is necessary, for, granting this, one would pick a liberty-loving, intelligent, properly fed ancestry and all else would be added thereto. Lack of employment means poverty, which causes hunger and fatigue, begets disease, and creates fear, worry, and instability—mental, moral, and physical. Lack of marked intelligence coupled with lack of proper education, clumsiness, carelessness, and fatigue, physical and mental, cause more than 90 per cent of the injuries requiring rehabilitation.

Prevention and carefulness have been the outgrowth of the task of rehabilitation, so there is some hope for the future—especially in industry, where safety devices and precautions of all kinds are now commonplace rather than exceptions as formerly. Employees, as well as employers, are learning the hard lesson. The greater number of injuries are still in the home, and these accidents are almost invariably due to the victim's own clumsiness, carelessness, or both, as oft-repeated statistics show.

Therefore, we will avoid rehabilitation in the future by having healthy mothers and fathers having healthy and intelligent children with fewer queer brain waves who, instead of being spoiled as at present, will be properly trained to take care of themselves.

Physical and mental fitness will be the great desideratum, and the nervous, the weak, the ill, and the unfit will be a gradually diminishing minority being rapidly rehabilitated or liquidated by nature in her own good time and way.

Stress will be laid upon industrial rehabilitation in this session, since that is what concerns a number of us today. Millions are spent yearly on these cases, especially in the

so-called "compromise" cases that are non-scheduled cases dragging out for months and years and eventually being settled to no one's satisfaction—the patient thinks he didn't get enough, and the carriers are sure he got too much, they also resent the hospital and medical bills, as well as the compensation. The medical bills are certainly not excessive if good work is done. Physicians are put to all sorts of annoyances from excessive tabulations to wasting time before arbitration boards where the arbitration may be quite unsatisfactory. Recovery is frequently retarded because adequate active treatment is not begun soon enough, and the patient is too frequently left to his own devices to think unduly of himself and his ailments to no good end.

There is also another angle—if the carriers limit remuneration for the surgeon, how can he call in the specialist in physical therapy? For a bad Colles's fracture \$65 is certainly insufficient for the skilled and busy surgeon, for he cannot possibly give the time and attention to working with the patient that the physical therapist has to give. There really should be something done to raise these subminimal fees. At the arbitration of 1 case of streptococcal infection of the hand of a boy 18 years old, where there was continuous daily supervision and treatment hourly for more than a month, the extremely modest bill of \$75 was cut to \$23! On another occasion two other physicians did not even know we had specialists doing this work. They asked, "Why didn't the surgeon do this work himself? Why didn't the intern do it? Why did you have to have a specialist do it?" At that time there were scores of extremely ill patients in the wards, and surgeons and interns were run ragged with the amount of regular surgical work.

The question is: Why were these two non-surgical physicians sitting in judgment on a case that was only saved from amputation and possibly death by the combined attention of several surgeons, interns, physical therapy physicians, nurses, and technicians? But

since they *do* sit on arbitration boards, they should be educated to what skillful surgery means and entails "The laborer is worthy of his hire," but that hire may be totally unworthy of the laborer. The insurance company says it is the county medical society that fixes the fees, and the county medical society says it is all the insurance company will give. Between these two points of view, the surgeons and physicians suffer, but they will, as usual, go on giving of their best.

Rehabilitation

Physical therapy and rehabilitation should be almost synonymous—at least one should always be thought of when the other is mentioned—since physical therapy can be such a useful adjunct to medicine and surgery in so many instances. The industrial surgeon, as a rule, quickly sees the advantage to be gained by employing this adjuvant as early as is compatible and is thus spared many failures, mental and moral as well as physical, when there issues forth the complaint of the majority of traumatic cases, "they just let me be there and didn't do a thing for me."

In many conditions an injured person is a person with a grievance. He is sure his "case is not well understood, he is really sicker than the doctors realize, what can a young doctor know of his case, and how can the older doctor, who sees him only a few minutes during rounds, realize his condition?" If he is employed and anxious to get back to his job, time hangs heavily upon his hands, and so he has plenty of time to worry about his family, the future, the result of his injury, his ability to work, and especially whether or not his job will be awaiting his return. If it is a compensation case, while some of the worry is relieved, the amount paid is usually insufficient to support himself or family, and debts are gradually piling up to be paid months or even years later. Then, if the injury is severe, he may be unable to return to his old job and what is to become of him and his family? To those of us dealing with traumatic cases this is the great concern—how can we return these cases to industry—any industry—quickly and economically?

To a person of normal constitution, who is, therefore, usually normal mentally as well, reaction to treatment is quick and decided. He responds, is anxious to get well, puts his mind to work on the future and, if he cannot resume the work to which he is accustomed, will endeavor to find another occupation that promises to remunerate him. In this class

usually are the mental workers or the highly skilled mechanical workers who have resources within themselves. However, there are numbers of workers who may be skilled in one particular line but whose education is far from extensive and who, if they lose their jobs, are a total loss—mentally, morally, and physically—unless someone is able to intervene and is willing to rescue them from the Slough of Despond and train them to work before the iron has completely entered their souls.

When the surgeon is making a grand job of putting the broken body together, he is using, *pari passu*, physical therapy to keep the organism fit, so that when the time comes to get the patient on his feet his muscles will have their tonus, his legs will carry him, his feet will be his own, and the bed won't feel so welcome after fifteen minutes' absence from it. This is particularly true in fractures and dislocations where the gentlest heat, skilled gentle massage, active motion of parts distal to the site of injury, and postural, respiratory and general active exercises are begun directly following reduction and immobilization. Teaching the patient proper posture, to breathe properly, to exercise his uninjured members, to move about within his circumscribed area, to move his fingers, to make a fist, to shrug his shoulders, and to contract the muscles within the cast or extension apparatus in injuries of the upper extremity will go far to prevent the adhesions, immobility, stiffness, pain, and marked disability that frequently ensue when the appliances are off, when the bones have knit, when the dislocation stays reduced, and when the wounds have healed.

This is especially true of hand and wrist injuries where the patient easily falls into the habit of doing nothing for himself intensively and continuously. While gentle heat and massage are excellent aids, it is the active exercise of body, mind, and injured member which is going to set this patient's feet on the road to a job. *Passive motion* has no place, usually, in fractures. When done, it should be the special concern of the surgeon or, at his behest, the physician especially trained in this particular work. The latter must be absolutely sure of his physical therapy assistants to delegate so delicate a task to them. It is not the ordinary technician's province. In wounds of the hand, unless motion is begun early, the result is usually a foregone conclusion. Sometimes through fear of pain, further injury, and the small amount of com-

pensation, the patient will *not* move his fingers, attempt to close his fist, or try to flex or extend the wrist. When, after months of late physical therapy, he finally *does* try, it is too late.

These are the cases that bring discredit upon physical therapy. It has been given too late, the patient's mind as well as his hand is set, and he knows he has been hurt more than anyone believed. When the truth is borne in upon him and he realizes he is doomed to pain and disability and that he is no longer a skilled worker commanding fair wages, he is then at war with his world and, sooner or later, he becomes a public liability.

In injuries of the lower extremity where longer time is required for healing and bed rest is absolutely essential, active exercise is needed more than ever in conjunction with the usual measures of gentle heat and massage. If this patient is to stand up in the world and tread again the wage earners' path, he must be in good general and local condition, his convalescence must be shortened, the habit of dependence must not be permitted to fasten upon him, and he must learn to do for himself.

It is a pity that every hospital is not endowed with a department of occupational and work therapy so as to keep alive and alert the mental and physical faculties of its bed patients. Were this possible, there would be much less unemployability at such an enormous cost as we now have and there would be fewer psychopaths and disgruntled humans.

Hydrotherapy, especially in the form of hydromassage given, generally, in all these cases as soon as possible, goes far to giving a sense of self-respect and well-being such as no other form of physical therapy can create. The patient looks forward to his underwater massage and exercise by means of the whirlpool, and he develops a desire to cooperate. If heliotherapy is unavailable because of inclement weather, properly given carbon-arc, radiant light and heat and ultraviolet will help to revive drooping spirits and prevent muscle destruction. But occupation is needed as well, and thus is frequently unobtainable. In certain cases the entire ward, office, and clinic have been set by the ears because of one restless, disgruntled, complaining patient who will not hesitate to make himself a nuisance because of lack of some occupation and no resources within himself.

There comes a time, however, when surgery has done its utmost, when physical therapy can help no further, and when getting the injured worker back to work is the all-im-

portant consideration. This, of course, is ever present in the mind of the physician, hence his training of the patient to do those things that ordinarily one does for himself in the daily routine of life. But, many times, the patient, especially if a compensation case, is out of the habit of work—he knows too much about his case, his symptoms, his supposed disability—he fears to face the future. His injury has given rise to a neurosis. In the ordinary course of events he will remain idle until his case is settled after months or years of discussion and wrangling between carriers and physicians, and then he will spend his substance within a few months or perhaps it may last a year or more. When it is gone, he is exactly where he was when discharged from the hospital as far as work is concerned—he is 100 per cent unemployable.

To get his "pain and disability" out of his brain is the great problem, and herein lies the most important part of rehabilitation—that of vocational guidance. This neurotic must learn again to use his muscles, actively, forcefully, with purpose, tools must be put into his hands and he must be shown how to use them. His teachers must be trained, skillful, patient, directing, guiding, stimulating, and encouraging. If there is such a group in your city, find it and direct your cases to it. If there is none, set about creating one.

The American Rehabilitation Committee was founded in 1920 after the First World War. New York State has a district director of the Rehabilitation Division, New York State Education Department, Frederic G. Elton, who conceived the idea of a Rehabilitation Clinic—a nonprofit organization. It is a work clinic where the disabled worker is checked up as to his capacity and ability and mental and physical fitness and where he is salvaged from the "dump," often in spite of himself, and remade into a useful citizen through carefully planned and constructive activities leading eventually to employability. The workshop has devices such as are required in the various trades, and these call for active physical and mental exercises on the part of the worker, whose interest is awakened and stimulated by seeing an object take form under his very eyes—the work of his own brain and hand. Frequently, undiscovered abilities come to light and point the way for better opportunities and remuneration.

It is the carrier's responsibility to see that the workman has no difficulty financially when the surgeon asks for work therapy.

There will be greater dividends in many ways from this policy than from the present one of get as much, give as little, as possible. Then patient, surgeon, physician, and carrier will work harmoniously to the best advantage of the injured person, and there will be fewer grievances all round.

Summary

See that the workman fits his job to prevent trouble.

Keep up standards of fitness.

Treat the injured patient early for best effect. Late "intensive physical therapy" may be too late. Stress self-help. Physical

therapy given early means early to work. Posture, active exercises, various modalities of physical therapy are essential to shorten convalescence. Occupational therapy helps. Work therapy is needed in certain cases, and it is cheaper for carriers to take this into account than to have these people eventually go on relief. The surgeon who institutes physical therapy early is more likely to have his patient return to work in good condition. The physical therapy physician can materially shorten the convalescence and stress an early return to work. In this way there will be fewer workers on relief, fewer misfits, and fewer grouches with grievances.

THE EARLY USE OF PHYSICAL THERAPY IN THE TREATMENT OF INJURY

Its Role in Minimizing the Need for Late Rehabilitation Measures

CLAY RAY MURRAY, M.D., F.A.C.S., New York City

THE trite but true saw that an ounce of prevention is worth a pound of cure is particularly applicable to the problem of minimizing residual disability following injury. This paper, in discussing the role of physical therapy methods in dealing with the problem, is essentially a justification of, and a plea for, the intelligent early use of these methods.

It is rather perplexing to hear frequent disparagement of the early use of physical therapy in the treatment of injury by those who nevertheless depend upon it implicitly in the late rehabilitation of the patient, often going so far as to depend on it exclusively. It is, in fact, impossible to explain any such point of view on a logical or physiologic basis. The very effects that are cited as proof of the value of physical therapy in late rehabilitation may, if exhibited during the first two to three weeks after injury, make those rehabilitation measures largely unnecessary. And this logically has to be so, unless our conception of the pathologic process that follows injury is entirely wrong or unless the physiologic effects credited to physical therapy measures cannot be elicited until the inflammation and repair process is completed. Neither one of these alternatives is tenable. The position that

physical therapy is of little or no value in the treatment of injury is a distinctly tenable one if based on a supported denial of the physiologic effects commonly attributed to the methods. But to maintain that it is effective if used late but useless if used early comes close to being ridiculous.

Before attempting to discuss the use of physical therapy in trauma, let us understand the primary pathologic process that leads to residual disability. The violence of trauma induces a variable amount of cellular death and devitalization, with a variable degree of damage to capillaries and lymphatic channels. The breakdown of dead and devitalized tissue produces chemical irritants inducing a so-called inflammatory reaction. If actual hemorrhage into the tissues occurs, the inflammatory reaction is increased in severity by the chemical irritation of broken-down blood constituents. Unless massive tissue death has shut off all circulation, the process of inflammation is initiated by increased vascularity of the part, dilatation of the smaller vessels and by inflammatory exudation into the part. This leads to heat, redness, swelling, and pain from tension—characteristic symptoms. With increasing tension plus the primary damage done to capillaries and lymphatics, blocking of the minute circulation occurs, with fluid transudate adding to the story of tissue tension. Indeed, this increasing tension may go on to complete local circula-

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 8, 1940.

Associate professor of surgery, College of Physicians and Surgeons, Columbia University; and associate attending surgeon, Presbyterian Hospital.

tory block and tissue death from this cause, as is often the case in the more intensely violent types of inflammation, such as burns, for example. Rapid clotting of the extravasated blood and inflammatory exudate occurs. Large portions of the blood and exudate, together with the irritating products of tissue death, should normally be carried off by the lymphatic and capillary circulations.

If by reason of tension and damage this minute circulation is blocked, then the fibrin network is larger and denser than it should be. And conversely, the more efficient that minute circulation, the less dense and inclusive will the fibrin network be. Moreover, the fibrin itself can be digested and carried off *so long as it is fibrin*. But within a few hours fibroblasts begin to grow out along the fibrin strands, initiating the repair process. At seventy-two hours a considerable fibroblastic growth can be demonstrated following any trauma with tissue death and extravasation into the tissues. Within a relatively few days the removable fibrin is represented by the irremovable collagen of new connective tissue. It is the new-formed and often excessive connective tissue that leads to thickening and loss of elasticity in mesotenon and paratenon, to fibrosis and loss of power and elasticity in muscles, fasciae, and ligaments, to fibrosis and pressure in and about nerves, and to prolonged obstruction of the minute circulations by, in effect, a broad, connective tissue tourniquet.

It is obvious that any treatment that will increase the rate of flow in the minute capillary and lymphatic circulation of the part will, if applied during the stage of inflammation and repair, eliminate hemorrhage, exudate, fibrin, and edema with a rapidity and in an amount roughly proportionate to the degree of efficiency of the minute circulations attained. It is not only obvious but it is clinically true. If applied early, such measures will eliminate in varying degree the pathologic conditions that lead to the disabilities requiring rehabilitation.

There is not enough definite information available as to the total physiologic effects of the various so-called modalities of physical therapy. There is still too much vague and indefinite quasi information cited in support of hoped-for physiologic effects. There are still those who are sure that the production of increased redness and heat in a part is evidence of increased circulatory efficiency therein, whereas intense engorgement with decrease in circulatory efficiency as measured

by rate of flow through the part is frequently the explanation. I have no intention of discussing the supposed actions of the various modalities of physical therapy. Speaking as a surgeon, I can safely state that any measure that will soften or eliminate induration, diminish swelling, and lessen the redness and heat of the part during the early inflammatory reaction after trauma is insurance against the need for late rehabilitation measures. From my own experience and that of others over a good many years, I have been convinced that elevation, gentle stroking, *sedative* massage, *low-degree* heat for *prolonged* periods, guided and resisted *active* exercise *when it can be accomplished without pain*, and muscle activity by electrical stimulation providing rhythmic, slow, alternating muscle contractions and relaxations *without either spasm or pain* will produce the effects cited above. Likewise, heavy massage causing discomfort, intense heat for short periods, active exercise resulting in pain or spasm, and electrical stimulation giving muscle spasm or pain result in aggravation of the conditions for the relief of which they are given. Regarding diathermy, for the moment merely as a method of applying heat, high milliamperages for short periods of time belong in the latter group and low milliamperages for prolonged periods of time belong in the beneficial group. Therapeutic lamps giving intense heat for short periods of time do not help, while the low heat of two or three ordinary light bulbs inside a blanket tent over a period of hours is a definite benefit.

It is particularly in fracture cases that this early use of physical therapy is deprecated, yet it is in these cases that it is particularly valuable. True enough, its early use in these cases necessitates the employment of methods for treating the fracture which will allow ready access to the part for the use of physical therapy, and these methods are sometimes more difficult to carry out than other simpler methods that bar ready access to the affected regions. If for any reason it is not possible to treat the fracture in a manner that will allow the use of early physical therapy, it obviously cannot be used. But this is surely no argument against the value of its early use. Nor is the final result alone the criterion whereby its value is to be determined. In the treatment of all injury, more particularly in industrial cases, the time taken to get an end result is of an importance almost as great as the result obtained. This fact cannot be too heavily stressed. And it is in the shortening of convalescence time by material reduc-

tion of the late rehabilitation period that the early use of physical therapy exhibits its greatest usefulness

Let us put the matter on a basis that brooks no argument. Any procedure that will improve the efficiency of the minute capillary and lymphatic circulation during the stage of posttraumatic inflammation and early repair will materially decrease the expectancy of residual disability necessitating later treatment. If there are procedures that have this effect, their use in the first ten days to three weeks following trauma will give decreased convalescence time and improved end results.

It is to be noted that the demand is for a single effect from the methods used—that of increased efficiency of the local minute circulation. Putting into the discard all other claims as to the effects of physical therapy modalities, are there physical therapy methods that will result in an increased local efficiency of lymphatic and capillary circulation? The answer is, I believe, in the affirmative, even though there may be considerable uncertainty as to the actual mechanism whereby the effect is produced. But it is a qualified affirmative, in that all the methods I have mentioned must be considered quantitatively as well as qualitatively. One cannot talk merely of elevation, heat, massage, muscle stimulation, and exercise as the forms of physical therapy to be used early in the treatment of injury. *Extreme elevation, intense heat for short periods of time, high milliamperage diathermy, massage causing pain or discomfort, muscle stimulation causing spasm or pain, and exercise causing distress to the patient* will only intensify local stasis in the minute circulatory apparatus. They should never be used.

The treatment of injury is an economic problem in a large percentage of cases. That is why convalescent time is almost as important as the final result. Two objections based on economic grounds are commonly raised to the early use of physical therapy in injury. One is the cost of the treatment. The other is the necessity for longer hospitalization of many fracture cases if they are to have effective physical therapy for ten days to three weeks. A third objection commonly heard is that it is unsafe to trust many fracture cases to the early ministrations of physical therapy technicians. A fourth is the difficulty of carrying out, in fracture cases particu-

larly, methods of treatment (such as suspension, the various methods of skin and skeletal traction-suspension, and operative fixation) which will allow early physical therapy.

Can these objections be answered? In regard to the first—the cost of treatment if adequately applied, the cost of early physical therapy should be more than offset by the saving of time in convalescence, even if the end result is no better than that obtained without its benefit.

The second objection is met by the same answer in regard to the necessary hospitalization time. But in many hospitals, particularly large municipal institutions, the turnover is such that by virtue of necessity those methods must be used which entail a minimum of hospital stay. This is an insurmountable objection as long as that condition is true, but in these same hospitals the cases that must necessarily be treated by methods requiring long hospital stay, and allowing early physical therapy, do not receive its benefits.

The third objection is certainly valid at the present time in many cases. The percentage of cases in which it is valid is, in part at least, up to the physical therapists. It is a question of adequate knowledge and training without the handicap of undue expense in treatment.

The fourth objection is valid when, because of lack of experience, skill, equipment, personnel, or organization, it is impossible to carry out methods of fracture treatment which will allow of the early use of physical therapy. But in many cases this requires only some personal initiative and effort for improvement. I strongly urge that the economic factors involved are important enough to warrant the effort. A supine inertia characterized by the expression "We can't do that" is often the only obstacle to overcome.

Summary and Conclusions

There has been presented evidence to support the view that early and intelligent use of physical therapy adequately meets the problem involved in the pathologic processes that follow trauma, and that its wider use, wherever it can be made possible, would be, on both clinical and economic grounds, a definite advance in the treatment of injury.

REHABILITATION FROM THE STANDPOINT OF THE CARRIER

MARK BUTLER, M D , Syracuse, New York

THE stimulus that rehabilitation and physical therapy received during and right after the World War was sufficient to attract the interest of the industrial medical world. It is true that the injuries of war are different from those of industry, but the fundamental principles of treatment are the same. There is no question but that rehabilitation and physical therapy intelligently applied are paying propositions both from a humanitarian standpoint as well as from that of dollars and cents.

In selecting our cases we must first decide if the case is one amenable to this type of treatment. We cannot always say whether treatment will be successful, but we can make our decision from past experience with similar cases. Cases that are outside the field of physical therapy—for example, injuries to the semilunar cartilages, sequestrums of bone, and constricting burn scars of the axilla, to name a few—should not be accepted with the hope of accomplishing a cure. All other factors being equal, the quicker method is the more economical, and physical therapy should not compete with surgery but should supplement it.

Just as an x-ray film is no better than the man who reads it, so is physical therapy no better than the person who administers it. It goes without saying that treatment should be supervised by a medical man and administered by a person, well trained in this field, who understands both the physiologic and pathologic effects. Physical therapy is not a soft snap or a gold mine as certain manufacturers of equipment in times past have tried to convince the medical profession. The use of a therapeutic lamp of some sort two or three times a week is better than nothing but is hardly sufficient in itself.

At our clinic we do not treat acute fracture cases, but we get better end results when a patient is referred to us more promptly after the immobilization period is over. Improperly applied or prolonged immobilization makes physical therapy doubly necessary. The healing of the fracture is of prime importance, and the institution of physical therapy should not jeopardize the proper healing of the bone. There are times, such as in acute back cases,

where a patient has to ride several miles in a street car or automobile to get a treatment. We feel that it is better for the patient to stay at home for a few days so that he can rest and apply some form of heat there. Later on, after the acute stage has subsided, he can come in for treatment.

In selecting cases the medical reports of the attending physicians, as well as reports from the company doctors in the field, are reviewed, and likely cases are examined by a representative of the company to pass on the advisability of accepting them for clinic treatment. If the case appears to be one that could be substantially benefited by treatment, steps are then taken to see whether or not he can come to the clinic. However, this is not done without the consent of the attending physician. The company defrays the cost of transportation and allows the patient an adequate amount for maintenance as long as he is being treated. Any medical or surgical emergency arising while he is a patient at the clinic is referred to a local physician as indicated.

As a rule we treat every case six days a week, and many of the patients have stated that they have noticed much more progress than when treated twice or three times a week. Treatment is continued as long as the patient shows satisfactory improvement. Prolonged and futile treatment does not pay. Patients are examined every two weeks, and degrees of motion are recorded so that we can keep an accurate check of the progress.

The type of treatment depends on the injury. Some form of heat is first employed, such as whirlpool bath, short wave diathermy, baking lamp, etc., followed by massage and passive motion as indicated. Active motion is encouraged, and patients get this in the curative workshop. Often they are given certain exercises to do at home. Besides providing for the exercising of the injured member, the function of the curative workshop is to offer a diversion to bolster the patient's confidence in himself and to divert his attention from his infirmity. We are able to get a better idea of the patient's true condition by observing him at work. The objects that he makes become his personal property to take with him when he leaves. Patients also perform their formal exercises in the workshop, which is equipped with various

tion of the late rehabilitation period that the early use of physical therapy exhibits its greatest usefulness

Let us put the matter on a basis that brooks no argument. Any procedure that will improve the efficiency of the minute capillary and lymphatic circulation during the stage of posttraumatic inflammation and early repair will materially decrease the expectancy of residual disability necessitating later treatment. A supine inertia characterized by the expression "We can't do that" is often the only obstacle to overcome.

Summary and Conclusions

There has been presented evidence to support the view that early and intelligent use of physical therapy adequately meets the problem involved in the pathologic processes that follow trauma, and that its wider use, wherever it can be made possible, would be, on both clinical and economic grounds, a definite advance in the treatment of injury.

the worth of our treatment. If the company only broke even we would feel that our efforts would still have not been in vain.

Conclusions

Rehabilitation intelligently applied is a paying proposition. The following questions have been discussed in a general way: who,

whom, when, how, how often, how long, and with what results.

The curative workshop is an invaluable aid in restoring active motion and strengthening the muscles. It is also an important factor in maintaining the patient's morale and is at the same time, an instructive diversion.

REHABILITATION AND WORKMEN'S COMPENSATION

V. A. ZIMMER, Washington, D. C.

THE basic philosophy of workmen's compensation has never been more clearly and more concisely stated than in the formula upon which the first act was established nearly 60 years ago, namely, "Industry should provide for giving compensation for pecuniary loss caused by accidents in connection with work, and add this expense to the cost of production."

In theory, this principle has been accepted in almost every sovereignty in the world. In practice, it is fully applied in none. Even under the most liberal of acts the injured workman suffers substantial pecuniary loss, and under a majority of existing acts he loses far more than industry in terms of money alone. Unfortunately, he cannot charge his share to production costs and pass it on to the consumers. He and his dependents must absorb it fully or at least up to the point where the public must step in and provide further relief.

Perhaps in no other form of social legislation has there been so much compromise with principle or so much variation in benefits or in form of application and operation of these benefits than in this business of compensating the worker for injury disability. We find, for instance, that a worker's arm in Wisconsin is worth \$10,500, in New York, \$7,800, in Michigan, \$3,600, and in Rhode Island, only \$2,000. In some states, today, no payment is allowed for permanent damage to a member unless it is amputated. In other words, a completely ankylosed wrist or foot or finger is compensated only on a temporary disability clause.

Now, about the all-important and vital matter of medical benefits—here we find an

equally variable concept of what constitutes equitable compensation for pecuniary loss.

In only eight of the forty-seven states having workmen's compensation laws are there no limits whatever on the liability of an employer to provide medical care for injured employees—either as to the amount of the money to be spent or as to the period of time over which treatment may be given. In one other state in which there is no limit as to the amount of the employer's liability, statutory limitation of the period of medical treatment to the period of compensation has been interpreted by the industrial commission as constituting no limit. In thirteen other states in which the laws impose definite limits on either the amount of the employer's liability or the period of medical treatment, or both, the board or commission is given the power to extend the limits indefinitely.

In the remaining twenty-five states, however, the laws impose an absolute ultimate limit upon either the amount, as in ten states, the period as in seven states, or both as in eight states. The limitations imposed by the laws of these twenty-five states differ—the amount limits vary, ranging anywhere from \$50 to \$800 in amount for medical treatment and anywhere from a record low of fourteen days up to one hundred months in period of time. It may be added, too, that in five states medical benefits in cases of silicosis are accorded special treatment usually in the nature of more definite limits as to time and amount as compared with accidental injury cases. To anyone at all familiar with the nature and type of injuries that are paraded before a compensation administrator, it is obvious that thousands of workers in this country either do not receive adequate medical treatment for their injuries or the public is assuming the burden of restoring them to physical fitness.

Read by invitation at the Annual Meeting of the Medical Society of the State of New York, New York City, May 8 1940.

Director, Division of Labor Standards, United States Department of Labor.

pieces of gymnastic apparatus. We do not attempt here to teach the patient a new occupation, but we try to restore his usefulness so that he can resume his regular occupation if possible.

In treating the patient, the injured part should be manipulated gently so as to get better relaxation and to gain the patient's confidence. Sudden and jerky movements are avoided. For instance, in giving passive motion, one minute is allowed to carry out that motion to the point of tolerance. The part is then held at that point for a minute or two, and then one minute is allowed to reach the starting point of motion.

The clinic at Syracuse was instituted in 1922 under the capable leadership of the late Dr. C. P. Hutchins, who had had a wide experience in rehabilitating thousands of soldiers wounded in the World War. To date the clinic has treated around 2,700 compensation cases—patients who come from as far south as Washington and as far west as Minneapolis and Chicago, many come from places remote from medical centers.

On admission, the patient's history is taken and he is examined. Routine laboratory tests are made. The clinic has a consulting staff to which patients are freely referred for purposes of diagnosis and advice as to methods of treatment. A search is made for any possible focus of infection, especially the teeth and prostate gland. If a focus of infection is found, appropriate treatment is instituted. We find that most of our patients have infected prostates, these are treated twice a week by a urologist. Autogenous vaccine therapy is resorted to in some cases.

The clinic does not treat any acute cases. The majority of our cases have had some injury to the wrist or hand, and they usually offer a good prognosis for improvement. However, in hands where there has been extensive inflammatory involvement with the formation of adhesions of the tendons, the outlook is not promising. Extension defects of the fingers usually offer a poor prognosis. Bursa cases are somewhat erratic, and some of them clear up quickly under treatment, while others lapse into a chronic stage. In periarthritis of the shoulder and subdeltoid bursitis, we have found that restoring abduction past 90 degrees is usually a slow proposition. Elbow cases respond well to treatment, extension defects being harder to correct than flexion defects. In fractures around the elbow, strong passives tend to produce excessive callus. Epicondylitis is usually slow to

respond. Old flexion defects of the knees are amenable to treatment but are slow to respond. Extension defects offer more difficulty, especially the last 15 degrees.

Foot and ankle cases usually offer a good prognosis for improvement when there has been good anatomic relationship, but ununited fractures and fractures of the os calcis with involvement of the subastragalar joint are often impossible of weight-bearing without surgery. Metal arch supports are usually supplied when patient has been off his feet for a long time and where patient has been relieved by inversion strapping.

Negative galvanism is used for treating small scars but is not employed on large ones where plastic surgery would be more appropriate. In cases involving a nerve injury we strive to improve the circulation of the part but guard against excessive electrical stimulation which sometimes tends to further damage the paralyzed muscles. In cases of complete paralysis the careful use of the sinusoidal current may maintain the muscle mass that would not otherwise be present. It has no effect on the speed of regeneration of the nerve. Once voluntary control has been established, muscle training and active use are more valuable than artificial stimulation.

Back cases are our biggest problem. The diagnosis may be obscure, symptoms may be entirely subjective, and treatment is often prolonged and disappointing. After a patient is discharged and judged capable of doing light work, he is likely to find no light work available, and he may have a recurrence of his old trouble if he does any bending or lifting. This means he will be back again for another course of treatment. In back cases, as well as others, we have x-ray studies made by a competent radiologist, and the patient is examined by an orthopedist. Many cases are fitted with a support. A patient with a bad back is especially prone to get discouraged and needs to be encouraged. We must not forget that we are treating an individual not just a bad back or a bad knee. Psychotherapy plays an important part, and the activities in the curative workshop are helpful in distracting a patient's attention from himself.

After it is judged that a patient has reached the limit of improvement through treatment, he is discharged. The cases are followed as much as possible to find out how they are settled and how much permanent loss is awarded by the commission in their respective localities. In this way we can check up on

we all know, there sprang up numerous industrial medical clinics in this state and particularly in New York City. Some were good—some bad. Some were well equipped and well staffed; others were neither and, in addition, resorted to all kinds of chicanery in soliciting business from employers and carriers. In fact, their tactics brought about an inquiry by the governor of the state and, later, action on the part of the legislature.

In some of these institutions an investigation revealed that employers and carriers were paying for physical therapy actually performed by laymen under the most superficial supervision of licensed physicians. It is not surprising that the reaction to all this was harmful to the theory and practice of restorative therapy in workmen's compensation cases. Despite this experience, which in no way reflects upon the essential value of intensive and specialized physical therapy, and despite the practical deterrents in carrying out such treatments as already outlined, I believe there is more than ever a need for revitalizing and re-emphasizing programs for the fullest possible restoration of the injured worker, both physically and in terms of productive rehabilitation. I have in mind particularly the fast-developing industrial practice of making pre-employment and periodical physical examinations of workers and job applicants for what is sometimes termed "progress and profit." Whatever the motive and however well-intentioned, the fact is that this practice screens out workers with physical defects and makes it more and more difficult to restore maimed or crippled workers to productive jobs in industry. It is a somewhat ironical circumstance that I am today appearing here before a group of medical specialists devoted to the better care and treatment of injured and maimed workmen so that they can resume gainful employment. Only a few months ago I attended a meeting of industrial physicians who advocated stricter physical examinations if not for the purpose, at least with the inevitable effect, of keeping them out of employment.

Your major purpose, as I see it, is to put back into industry every maimed worker, equipped with the greatest possible restoration of his physical functions. You doubtless believe, as I do, that the workmen's compensation principle is not fully met merely by monetary payments and the minimum possible medical treatment but that, under this principle, no effort should be spared to make him a competent and productive worker.

On the part of your fellow practitioners who are striving for wider extension of pre-employment examination of workers, the motive is equally honest if not equally constructive. They believe that the general health cause will be promoted through the early detection and correction of latent defects and that the incidence of accidents and occupational diseases will be reduced by screening out, or the proper location, of workmen in a given industry. It may be argued, and probably will be, that there is no real conflict between these objectives. In theory there is none. But an examination of the standards of physical fitness set up by many industries as prerequisites of employment will reveal findings most discouraging alike to advocates of physical therapy and to rehabilitation officials whose duty is the job of placement of physically handicapped workers. It has never been an easy task to induce management to take on the rehabilitated worker, particularly one with a major physical defect. The rehabilitation service encounters more or less constant sales resistance. It requires no great keenness of vision to discern the fact that if this agitation for pre-employment examinations continues and the plans are only adopted by small industries generally the best efforts of a therapeutic specialist and the rehabilitation experts will go for naught. It is useless to refit the worker for a job that doesn't exist or for which he never can qualify simply because of a remaining anatomic defect.

A few years ago I sat in on a long conference between a rehabilitation worker of this state and the chief physician of a great railroad system. The immediate subject was the employment of a young lady who had been trained for office work by the Rehabilitation Service. The girl was lame as a result of infantile paralysis and used a crutch in walking. Her application for an opening in the railroad office had been rejected because of the impediment, and this conference was an appeal from the rejection. I recall that the doctor was quite adamant in his resistance. He maintained that even an office worker thus crippled was an extra hazard from the accident angle—that she might stumble and fall and thus become a compensation liability. It took several hours of persuasion and argument to get his final approval of the employment of this handicapped worker. Of course the doctor had no data to show that the lame worker falls more frequently than the normal worker. He reasoned that it must be so and

This situation under some of these limited medical benefit acts seems not unlike the spectacle of an ambulance rushing a stricken patient to the hospital gate and then unloading him on the sidewalk. Certainly, even modern medical science is not geared up to the mending of a broken back or the healing of a severed arm in fourteen days. And we can hardly visualize \$50 as defraying the cost of major operative treatment even at cut-rate surgery prices.

Of course we cannot believe that any seriously injured worker is actually thrown out of a hospital or a doctor's office at the end of thirty, sixty, or ninety days merely because the law limits the medical obligations of industry. What probably happens in many acute cases is that either the hospital or the private doctor carries on the treatment without remuneration if the worker is unable to pay for the services. Presumably, too, in many instances the public provides the medical services, through its relief system, from the point where workmen's compensation benefits leave off.

It has seemed to me advisable to throw up a rough but realistic picture of our workmen's compensation status in this country because it serves as a background for any discussion about preparing the disabled worker for re-employment.

In New York State, of course, the function of physically repairing the injured worker is not hampered by statute limitation of medical treatment under workmen's compensation. Here the workers are entitled to such medical aid and treatment as the nature of the injury demands, unless, unfortunately, he happens to be a silicosis victim.

Under workmen's compensation procedure the practical problem in this state, as I know it, is to determine at what point physical therapy should be suspended and at what point the case should be adjudicated and closed on the basis of existing disability. This is true both as to the schedule and the nonschedule type of disability. The question, of course, occurs most frequently in relation to injured members for which the act sets up a specific schedule of compensation allowance. Based on my own observation here in New York, we as administrators were prone to adjudicate these permanent injuries altogether too early. In practice, this is extremely difficult to avoid. In the first place, it is hard to resist the insistent demand of the worker, who, having lost at least one-third of his earnings during the temporary disability period, is naturally anxious

to get the money due him for a permanent loss. Our staff physicians are sympathetic with the claimant's predicament and perhaps after postponing final appraisal for several months may finally yield a point in the interest of economic urgency and fix the schedule, even though time or further treatment might bring about a better result or a more usable member.

The insurance carrier, too, has his own problem in respect to extended physical therapy in these permanent impairment cases. He has been advised from the start that some degree of permanency will result from an injury in a given case. Naturally he is interested in reducing this permanency as much as possible up to what we may call the point of diminishing returns. That is, he will insist upon continued therapy only when it is clearly evident that it will materially lessen the ultimate loss for which he is called upon to pay. Indeed, he can hardly be censured for weighing carefully the cost of restorative therapy against the cost of the schedule "as is." It should be kept in mind that the medical cost of workmen's compensation cases in New York State is about one-third of the total payments for direct benefits. It is quite natural, therefore, that the carrier demands rather definite assurance that an extended program of therapy is going to bring comparable returns in reducing direct benefit payments. I can well understand that medical science cannot, in all cases, give positive assurance of this result.

This brings me to a point that is most embarrassing, particularly when discussing it before a group of eminently ethical members of the medical profession, but it enters into this subject so prominently and pertinently that evasion of it would be simply dodging a factor known to every compensation administrator, every insurance carrier, and many medical practitioners in touch with the subject. Within recent years—and incidentally during my term as compensation director in this state—there came about a rather general feeling that physical therapy was overdone, that its benefits were grossly exaggerated, and that it was a commercialized field of the medical science. Whether justified or not, this specialized practice took on a somewhat tainted tinge in the eyes of administrators, insurance carriers, and even, I believe, some of the medical profession itself. Unfortunately, there were some undeniably tainted practices that prompted this reaction to an earlier enthusiasm for the science. As

We cannot overlook the emotional consequences of accidents. They are important and need consistent attention to secure in the least time the least loss of vocational capacity and work ability. Their neglect during the vital period immediately following accident provides the opportunity for their development and causes both unnecessary physical impairment and vocational interference. It is here that more complete after-care treatment is necessary. I will term it "physio-vocational therapy" because it combines physical therapy and vocational therapy.

First, then, to put this workman back with the least amount of loss of time and of vocational capacity and work ability, physical loss and vocational loss must be equally considered and handled concurrently. The doctor must be informed, but he cannot and should not be required to make this diagnosis of physical job performance impairment and needs. Two specialists are needed—the physical analyst and the job analyst. The latter makes a diagnosis of the injured worker's established vocational limitations and possibilities and determines the minimum of job performance physical activity to conserve a maximum of work ability. The physical specialist must consider this. Such job relation cannot be imprinted into medical service except by consultation and cooperation. The importance of the medical service is incontestable, but its present vocational value can often be questioned, particularly in the absence of physio-vocational attention as a part of that service. It is industrial surgery and industrial medicine, but it will only achieve maximum industrial accomplishment by cooperation and by consideration of the physical job performance requirements and the vocational limitations and possibilities of the injured workman—a program that will restore a maximum of his vocational possibilities.

With this emphasis on a major objective—to return the patient to work with the least amount of loss of time and loss of vocational capacity—it is necessary to determine the worker's major occupation. The work he was doing when injured may have no relation to his regular work. His major occupation must be analyzed with exactness, movements must be detailed, and strength and speed must be determined. With this, however, must be made an inventory of his broader normal or basic vocational possibilities.

The job history will indicate his work attitude and his dependence upon unskilled physical strength or a degree of skilled muscular

performance and will illustrate his work pattern as it has existed. A study of his personality characteristics, that have largely controlled his progress in employment, and his education, mental capacity, and aptitudes establishes his maximum vocational possibility or job level. This analysis gives job possibilities that, interpreted into physical job performance requirements, establish a relationship to the disability, it also gives the effect upon his return to his type of employment and the minimum of physical restoration for the rehabilitation of his physical work capacity. The disability consequences have not improved his general employability, on the contrary, they detract from his assets and accentuate his liabilities.

In weighing his vocational possibilities, changes resulting from the accident and their effect on his normal work pattern must be considered. As a consequence of accident the ability to engage in work and to enjoy the normal life of a normal person has been impaired. Life's routine is disturbed. The disability, enforced idleness, and compensation litigation may develop a lack of courage and confidence and promote fear, impatience, instability, and malingering.

Logically, emotional exhibitions of bitterness or indifference may be expected. Legal and medical influence, coupled with the continued discussion of his condition in his presence, can implant in him a deep-rooted belief that he is a most seriously disabled person. He starts scheming.

The extent of disablement may then be exaggerated. Emotional traits rapidly develop, nullifying job qualifications and destroying work habits. These consequences of accident are as important as the physical damage and need early and prompt attention. Prevention is better than cure.

The primary need of the adult injured is speedy restoration of earning capacity. The most satisfactory job readjustment is on the basis of existing qualifications, knowledge, skill, and experience. This again emphasizes the paramount importance of maximum physical restoration.

Because of the lack of provision for a job analyst for medical consultation and the absence of any physio-vocational therapy linked to the medical service, maximum functional restoration has often not been secured when the case is adjudicated, causing the award of an unnecessary percentage of physical loss and a consequent high degree of vocational impairment. This often amounts to

on that basis had set up his employment policy.

I think this is typical of many of the standards adopted by industry. They are based on theory instead of actual experience, but, unless they are checked through a more thoughtful appraisal of the economic and social effect of these restrictive employment standards, there will soon be no incentive for the science of physical therapy and for the technique of rehabilitation training. That would

mean merely relegating to the scrap pile those thousands of American workers who annually meet with permanent injuries in the course of employment. We would indeed thus solve our unemployment problem merely by adding millions to the ranks of the unemployable. It is my feeling that this organization can be made a real contribution in breaking down what seems to be a growing prejudice, a seeming fetish, for the employment only of the 100 per cent physically perfect worker.

RESTORING WORK ABILITY

FREDERIC G. ELTON, New York City

TO GIVE point to my consideration of this topic and my discussion of it, I have defined the objective or purpose of everything that is done for a disabled workman, following accident, from the point of need, time, methods, and cooperation.

The purpose is to do everything possible to put an injured worker back to work with the least amount of loss of time and loss of vocational capacity and work ability and to do it with intelligent understanding of his employment needs.

I offer you then this thought—the job, a specific kind of job, as the axis about which rotates the life of each working man and woman. We are engaged in repairing a break in employment. Each service afforded the disabled worker will achieve its greatest value only as it contributes efficiently to this end and as each picks up without a break and supplements the other.

Surgery, therapy, compensation, and vocational adjustment will never function to the best advantage of the injured man until each intelligently cooperates in considering the man and his whole need as controlled by his employability generally and his qualifications and limitations specifically.

Large numbers of these industrial injured, after discharge from medical service and upon final disposition of the compensation claim with a percentage of physical loss or agreed upon settlement, are in no condition to return to employment. In fact, they are not acceptable to employers. To such numerical extent,

at least, something appears to be radically wrong.

If we would give this emphasis from the beginning of treatment to the preservation and restoration of work ability, it is necessary that we first know something about the specific physical job performance demands that control and limit each patient's work possibilities and, second, follow intelligent surgical work with immediate and equally intelligent therapeutic measures directed toward the job needs of the patient. This is an individual matter for these job performance demands differ. The physical job requirements must be known.

It is because of this difference in physical job performance requirements that physical impairment does not measure the extent of vocational or job impairment. A major physical loss, apart from its emotional consequences, may disclose no vocational loss while, to the contrary, a relatively minor physical loss in itself may be a major vocational loss (amputated leg, office manager versus index finger, right hand, watch repairman). Disabilities of equal physical impairment will likewise have differing vocational consequences. Physical loss and vocational loss are not necessarily alike and should not be considered so.

Vocationally, we can consider a great majority of the injured men and women as temporary totals immediately subsequent to the accident. It would appear to be someone's responsibility to prevent them from being vocationally permanent totals. It is going to make it a lot easier to do this, increase the possibilities, and decrease the time it takes to salvage these vocational wrecks if we can initiate this unity of thought and service and do it early.

Read by invitation at the Annual Meeting of the Medical Society of the State of New York, New York City, May 8, 1940.

District supervisor, Rehabilitation Bureau, New York State Education Department, New York City.

The range of work activity opportunity is from the skilled to the most unskilled type of employment

If, as has been demonstrated, employability by this means can be restored two to four years following injury and the closing of the case in the compensation record, is it not psychologically and economically sound to inject such service into the medical period of service to stimulate and hasten recovery and prevent the economic loss of unnecessary idleness?

Job Training

Generally, an adult injured worker is happier when returned to work and to an environment with which he is familiar. To accomplish this, if possible, should be the combined objective of medical and vocational service

Maximum physical job improvement will not always render a workman able to return to his former work. A change of occupation, often unrelated, must then be considered. The carefully diagnosed employment qualifications may then be used to decide upon the advantages and possibilities of training for a new occupation—an occupation in which the residue disability will not interfere with the performance of the work and in which the workman may compete upon an equal basis with the other workmen.

The retraining of the adult for an entirely new work is often not feasible and not advantageous. To retrain in an entirely new occupation means that the adult workman may be required to start at the bottom of the ladder at a low initial wage and compete with the younger men entering that vocation. Jobshave similarities, and jobs with similarities should be grouped together. An injured workman should not be moved outside of that ring of jobs with similar demands unless absolutely necessary. Environmental conditions are as important as job performance. If retraining is to take place, it should take place within the circle of somewhat related jobs as to performance and environment

Vocational training has been successfully used when mental capacity and aptitude indicated its constructive possibility and advantage. Training has been provided in refrigeration, air conditioning, airplane sheet metal work, and innumerable other skilled trades. Thus, it has been a factor in putting the workman back on the job with the least loss of vocational capacity and work ability

Examples

A man, aged 36, fell from a fire escape striking his head. After four years of compensation litigation and medical and neurologic examinations, a nonscheduled settlement in the amount of \$4,500 was proposed. Complaints of severe headaches, dizziness, tremors, and disturbances of vision and hearing were made. Four years of idleness had convinced this man that he could not again satisfy the demands of any employer, and he sought refuge in the idea of purchasing and operating a butcher shop of his own. The idea to him meant little effort and an easy living. He was absolutely unqualified for this business and unemployable otherwise. It was recommended that no further consideration be given to the settlement until it was determined what could be done to improve his employment status.
